CONTRIBUTIONS TO ORTHOPÆDIC SURGERY.

By Lambert H. Ormsby, F.R.C.S.,

Surgeon to the National Orthopædic Hospital, and to the Meath Hospital and Co. Dublin Infirmary.

It is my intention from time to time to give a short account of some of the most interesting cases of deformity that present themselves for relief at the National Orthopædic Hospital. The following selected cases are, therefore, reported on the ground either of possessing some features of special clinical interest, or because they are departures from the more usual types of surgical affections, as well as for the sake of giving a slight idea of the work done by this institution. For convenience, it will be necessary to group the deformities under seven distinct heads, viz. :—1. Rickets. 2. Malformations of feet and hands. 3. Spinal curvature. 4. Contractions of tendinous, muscular, fibrous, and cutaneous tissues. 5. Deformity arising from derangement of joints. 6. Muscular paralysis, with wasting and debility. 7. Other deformities not included in the preceding categories, such as harelip, cleft palate, &c.

In this paper I will confine my remarks to the subject of rickets, illustrating it with cases.

Rickets is a disease which is perhaps the most frequent affection met with at orthopædic hospitals, producing at times the most distressing deformities. It is particularly a disease of early life, the period most common being between the seventh month to two years, and is characterised by a peculiarly soft state of the bones, with a loss of their usual stable firmness, the consequence of a deficiency of the lime salts, particularly the phosphates. The bones then become distorted in every direction—in some cases by the action of muscles; in others, particularly in the extremities, by the superincumbent weight of the body, and the bones then partake of deformity in an exaggerated degree in a direction of their natural curves. Rickets, or rachitis, as it was called by Glisson, who believed the disease to originate in the spinal column, is most prevalent in young children residing in those crowded tenements in the ill-ventilated and unsavoury districts of large cities—hence the great advantage of sanitary reform and permanent benefit that may be bestowed on our poorer brethren. Young mothers of the poorer class have much to say to the production of the disease in their offspring, whether through ignorance, negligence, or, as is most often, the force of circumstances. They indulge in intoxicating liquor, partake of insufficient, and frequently improper, food, and habitually breathe in foul and polluted air. The disease may thus be communicated from the mother to the fœtus in utero; and there are cases on record, and skeletons of rickety fœti preserved in various museums, which prove that the disease may be communicated at a very early period of fœtal existence, and it can be easily understood that the same causes would have the same effect in producing the disease shortly after birth, particularly if the child was fed with the milk of the mother, who disregarded every hygienic rule and principle. If the infant is fed by the "bottle" it may also become rickety, being denied what is naturally suited for its delicate organisation and future development, and given what is at its best state but a very poor substitute; and I find by my notes that the majority of rickety cases were "bottle-fed." The effects of the disease may be partial or general, the former affecting the bones of the extremities, the latter affecting every bone structure in the body.

Rickets, as I mentioned before, may be present as a disease at a very early period, but its partial effects may not be perceived until about the walking period, from the eighth up to the sixteenth month. The child may creep about on the hands and knees, and much of the weight of the upper half of the body will be necessarily borne by the bones of the arm. In a very short time the ulnar and radius will soon show signs of distortion; and some believe, when the disease is present, it can be first per-

ceived in those bones. If, however, the child walk very soon and creep, very slight effects will be first seen in the tibia and fibula in a greater or less degree, producing a distortion which, if left without treatment, may become permanent, or else produce some other deformity equally unfortunate in the same individual. The disease may be general, by which term is meant to imply that it is not necessarily an affection confined to the osseous system, but that it may affect every tissue in the body more or less. Little, Sir William Jenner and Brodhurst all concur in the same opinion, viz., that it is a disease of malnutrition, one tissue in the body may be affected just as much as another. Deformity being about one of the most apparent signs, the osseous system has been thus erroneously considered to be alone affected. However, as regards the general effect on the bones, the spine becomes shorter, being ill-developed and greatly distorted in various directions. The anterior part of the chest becomes deformed in consequence of the spinal distortion behind and the depression of the ribs laterally, and the projection forwards of the sternum, which is termed *pigeon-breasted.* The bones of the pelvis become contracted and fall in, and the pubis and the sacrum become closely approximated, so that the cavity and out-let of the pelvis is greatly diminished in size. The clavicles are bowed and prominent forward, the ossa humeri are twisted and bowed outwards, the radius and ulna follow in the same direction outwards, the finger joints become clubbed and large, the thigh bones become curved forwards and outwards, the knees are approximated, and the tibia becomes bowed, generally forwards, or perhaps outwards, throwing the feet in a somewhat splayed condition. You also find, towards the articular ends of the long bones, a slight swelling, very apparent in the lower end of the ulna and radius. This swelling, I may mention, as I have seen a very early indication of the disease accompanying this very distorted condition of the bones. The body is thin and puny, the muscles flabby, and ill-developed; skin, pale and loose; abdomen, pendulous and large, with bowels either suffering from constipation or diarrhœa.

Treatment of rickets may be divided into local and constitutional, the local treatment consisting in the application of various mechanical splints and supports, so as to prevent the increase of the distortion and give the limb a correct and normal direction for development. At the National Orthopædic Hospital, the Committee allow the surgeon on duty, in the bounds of a regulated discretion, to give gratuitously certain mechanical supports to those who are precluded by poverty from getting such instruments as would be useful for the cure of certain kinds of deformity. In this matter the Committee deserve to be highly commended, for advice may be easily got, but instruments have to be made by careful and skilled workmen, and in many instances are quite beyond the means of the poor and deformed cripple. As regards the application of instruments and mechanical supports in orthopædic surgery, it is painful to see the great ignorance that is often displayed by those who are not in the habit of frequently treating such cases. Weak and debilitated children frequently present themselves at the dispensary connected with the hospital with heavy and clumsy irons attached to their attenuated limbs—erroneous in principle, and in most cases far too heavy and complicated to be of the slightest permanent use. Mechanical supports are not intended to take the place of the muscles; they ought merely to give slight support, so as to favour their development and action. For example, some months ago I was consulted by a young gentleman, aged sixteen, for debility and muscular wasting in the right lower extremity. He had been under the care of an able surgeon, engaged in large general practice, previously to his coming to me, who gave him a letter to an instrument maker in this city, who was told to make a support *suitable for his case.* The instrument was made, weighing 8 lbs. in weight, and the effect was merely to make the young gentleman more helpless and debilitated. I certainly applied a support, but it did not weigh more than 3½ lbs., and this weight well distributed over a great extent of surface; and since its application this young gentleman has greatly improved in health and strength of limb. Instrument makers, no matter how ingenious and mechanical, must have help and personal supervision from the surgeon in charge; and if the surgeon will not take the trouble to go with his patient instead of writing, and have him properly and carefully measured, he cannot but expect disappointment if he never sees his patient again.

In rickets affecting the bones of the lower extremities, light metallic supports are of the greatest use, together with baths of rock salt. Every morning, after each bath, the limbs are to be rubbed with a rough towel, and then cod-liver oil rubbed into the rickety limb night and morning for about ten minutes at a time. As this cod-liver oil is a rather unpleasant application, red flannel drawers are to be put on the child, so as to prevent its other clothes and bed being soiled. In some cases, when the curve is very slight, it is as well to prevent the child from walking too much until the bones become firm and stable. In children of two and three years old, I have been able, by forcible manipulation, to bend the bones of the lower extremities perfectly straight, and then apply light splints in the straight position for some weeks. After the age of three years the bones will seldom bend without fracturing and producing the sallyswitch variety of fracture, This, to the practical surgeon, when it occurs in the effort to straighten the limb, need not give him the slightest concern, for rickety bones unite very quickly. I have adopted this plan in five cases with the happiest results. Mr. Howard Marsh, of St. Bartholomew's Hospital, practises the same treatment. (*a*) In cases where such treatment is suitable, a cure is effected in a very few weeks.

The constitutional treatment consists in the exhibition of cod liver oil and tonics internally, with good and generous diet; lime-water, and preparations of iron, eg. tinct. of the perchloride, or, what is more suitable, the syrups of the phosphate and iodide of iron. A preparation which I think very highly of, and use very frequently, is the *Syrupus ferri phosphatis comp.* (*Parrish.*) This preparation is called chemical food, and is most suitable for children, as it is a red palatable syrup and easily taken, it contains in every fluid drachm 1 gr. phosphate of iron, 2½ grs. phosphate of lime, besides soda and potash. The dose being 1 to 2 drachms once or twice daily, it does not constipate the bowels, which many other preparations containing iron invariably do. Change of air to the country or to the sea-side is of the greatest service in many cases, and the strictest attention paid to correct at once any predisposing causes. When it is apparent in this way, much distortion may be happily prevented in a very early stage.

The following cases are reported as good examples of the disease:—

Case I.—Sarah C——, aged 2½ years, was brought to the National Orthopædic Hospital, on the 28th August, 1876, suffering from general rickets. In aspect she was a puny, stunted, and ill-developed child, with a large pendulous abdomen, with every bone in her body distorted, well-marked swelling, characteristic of the general implication of the disease, apparent at articular ends of long bones; clavicles, humeri, ulnar, radius, and femur all much bowed. Treatment adopted, dietetic and constitutional. Child had never walked, and was bottle-fed.

Case II.—Mary B——, aged four, was brought to the hospital, on September 29th, suffering from partial rickets, with double-bowed lower extremities from the knee to the ankle, tibia bowed forwards and outwards; the child in other respects healthy. Treatment adopted local, a tight metallic support on each limb, baths of Tidman's sea-salt; limbs to be rubbed with cod-liver oil.

(*a*) St. Bartholomew's Hospital Reports, 1870, Article XV., "Notes on the Surgery of Childhood," by Howard Marsh.

Internally, Parrish's cnemical syrup; dose, a drachm twice a day.

Case III.—Michael D——, aged 4½ years, was brought to me on October 3rd, 1876, suffering from bandy legs. The deformity was very great—in fact, it was the worst case of bowed legs I have ever seen. The femur was as much bowed as the tibia, and the boy had much difficulty in walking at all. I tried in this case to bend the tibia, but the bones at this age I could not bend without fracturing the deformity. Being of such a distressing nature, I determined to forcibly straighten the limbs. On October 14th, previously having the boy etherised, I forcibly straightened the left tibia below the knee, and put the limb up in a straight splint. No bad symptom followed; and on November 6th, in the presence of my colleague, Mr. Porter, and a large number of students, I straightened the right tibia in the same way as before. The boy is now walking about, and in a future report I will give a photograph before and after treatment, showing the great improvement in the case.

Case IV.—Joseph S——, aged seven, was brought to me on November 13th, with lower limbs bowed directly backwards—a very unusual form. The spine of the tibia, instead of being convex forward, was concave, and very convex backwards. Treatment adopted, baths of Tidman's sea-salt, with inunctions of cod-liver oil; Parrish's chemical syrup internally.

Case V.—Emma H——, aged three, was brought to me, suffering from double-bowed lower extremities. Tibia very much bowed forwards, slight tendency to knock-knees, muscles very poor, poorly developed, deformity increasing for the last few months—one limb rather more affected than the other. Treatment adopted: I applied a light, straight metallic stem, attached to the heel of the boot, passing to below the knee up the centre of the calf, which was concave backwards. Attached to this stem was a wide leather support, laced up over the spine of the tibia, in front, from the knee to the ankle. This was light and simple, and had the effect of endeavouring to obliterate the convexity forwards and the concavity backwards of the tibia by approximating the curved leg to the straight posterior metallic stem. In this form of curvature I have adopted this plan of treatment with very great success. Improvement must not, however, be looked for too soon, as it sometimes takes months before the improvement is well marked.

Clinical Records.

OBSTETRIC MEMORANDA.

Reported by John W. Martin, M.D.,
The Grange, Dronfield, near Sheffield,
Late Assistant-Surgeon, Mayfield Factory Dispensary, Portlaw.

Case II.—*Sixty-five grains of Hydrate of Chloral given in Divided Doses—Labour Rapid, Easy, and, comparatively speaking, Painless—Post-partum Uterine Contraction good—No Post-partum Hæmorrhage—Convalescence good.*

The subject of these notes was in her second pregnancy at full term. Her first delivery was effected under the influence of chloroform, partially administered, but not sufficiently so, to prevent the labour from being very painful.

Regular hard pains set in at 9 p.m., but previous to this she had suffered rather severely from premonitory pains for twenty-four or thirty hours. On examination, when seen at 9 p.m., I found the "os" dilated to the size of a shilling, its edges being thin, hard, and resisting. The head was presenting, the waters were unbroken, and the pelvic cavity was well formed and roomy, the passages being cool and moist. The severity of the pains was increasing, the intervals of intermission were becoming shorter, and the labour promised to be a very painful one. The rectum being loaded with fæces I cleared it out with a simple enema. At 9.30 there was no change in the condition of the "os" uteri.

I then gave the first dose of chloral, consisting of twenty-five grains, following it up with a second of twenty grains in the course of half an hour. After the second dose she rested quietly during the intervals of pain, enjoying good, refreshing sleeps, the respirations being long drawn, quiet, and peaceful to a degree; the pains were greatly diminished in intensity, but were unchanged in their regularity and force. This latter could be well measured by placing the hand over the uterus and there feeling the strong contraction that accompanied each onset of pain. At 11 p.m. I gave another and final dose of twenty grains to keep up the effects of the drug.

The effects upon the "os" uteri were remarkable and instructive. From being thin, hard, resisting, and undilatable, the edges became thick and rounded, easily dilatable, and bathed in an abundance of mucous, which was freely poured out from all parts of the maternal passages. Dilatation went on rapidly. The descent of the head through the pelvic cavity was steadily progressive, each pain telling. The child was safely delivered at 2.30 a.m., after five hours and a-half of regular labour. The pains of expulsion through the external parts were these most felt. The waters remained unbroken almost to the last. The pulse remained throughout steadily at 84 per minute. I gave no support to the perineum, but retarded the expulsion of the head just at the last, as long as I was able, until the parts were fully and gradually distended; there was no laceration. The placenta followed in the course of fifteen minutes, being expelled by the contraction of the uterus, aided slightly by manual pressure.

Post-partum uterine contraction was all that could be desired, and there was no post-partum hæmorrhage.

The patient was delighted with the effects of the chloral; she said that her sufferings were not nearly as great as before when given chloroform, and that, in fact, she had had a very bearable time of it. Her convalescence was most favourable.

Literature.

THE PRACTICE OF SURGERY. (a)

Mr. Bryant has divided his work into two very portable volumes. We have had the curiosity to compare the capacity of the work with that of a volume of Ziemssen's Cyclopædia, and find that three of the latter would scarcely contain more matter than the two volumes of the work under consideration. When we add that the author's style is by no means wordy, it will be understood that the book contains a great deal of matter; this is the case—moreover surgery is an extensive subject.

A useful introductory chapter contains directions for thoroughly investigating a surgical case, and a scheme for drawing up a report, whether written or mental—a great help ro the clinical clerk and to the busy practitioner.

In the next chapter, on repair, a diagram from a drawing by Mr. Howse illustrates a concise but clear description of a healing sound. The pathological woodcuts are excellent in all parts of the book, especially those accompanying the article on the microscopical anatomy of tumours, which woodcuts, the preface tells us, are due to Mr. Ursley.

The section on inflammation is made up chiefly of extracts from the writings of Simon, Paget, Burdon, Sanderson, &c., mostly given in their own words. A good feature in this work is that the source of an an extract or

(a) "The Practice of Surgery." In two Volumes. By Thomas Bryant, F.R.C.S., Surgeon to, and Lecturer on Surgery, at Guy's Hospital. Second Edition, with 599 Illustrations. London: J. and A. Churchill. 1876.

reference is given in the text, and not referred to at the bottom of the page.

In the chapter on abscess the author extracts from Mr. Hilton's lectures on rest the Guy's Hospital method of opening deep abscesses. "I cut with a lancet through skin and cellular tissue." "I push a grooved hook, or grooved director, upwards into the swelling in the axilla;" for instance, "a little opaque serum or pus will show itself." Now "take a blunt instrument, as a pair of dressing forceps, and run the closed blades along the groove into the swelling. Now, opening the handles, you tear open the abscess, and keeping open the blades during the withdrawal of the instrument you leave a lacerated canal for the easy exit of matter."

Mr. Bryant is not an enthusiastic admirer of the Lister treatment, although he calls it "worthy of adoption" in chronic abscess. A laudable tone of caution pervades the whole book.

With regard to mortification, Mr. Bryant takes, in some respects, views of amputation differing from those of surgeons who are considered authorities, his rules being as follows:—"In a case of local injury, as a bad compound fracture, the first onset of an inflammatory action that assumes a gangrenous form should be met by amputation." "Where the action is due to *general* and not to local causes amputation will not arrest it." With a line of demarcation, amputation may be performed with a better prospect of success." And in defence of these opinions he says that those who hold views opposed to his (especially about waiting for the line of demarcation), do not seem to recognise sufficiently a difference between gangrene due directly to the injury, and involving the injured part, and the rapidly spreading gangrene that begins at the seat of injury and travels upward, "the former being due to the accident," and "the latter to some inherent weakness in the general power."

In the treatment of erysipelas of the face and head numerous small punctures are recommended. In the cellulo cutaneous form of the disease a number of limited incisions are preferred to the very long *one* sanctioned by Lawrence and other surgeons; water-dressing is to be employed rather than poulticing in the after-treatment.

The same chapter takes a comprehensive view of abscess, ulcers, bed-sores, hospital gangrene, septicœmia hectic, and pyæmia.

This last affection is attributed to embolism, arrested purulent matter becoming the centre of the morbid changes found after death. In a tabular statement of 203 autopsies of cases dying from pyæmia, 91·6 per cent revealed affection of the lungs, 38·4 per cent having those organs *alone* involved. The liver was affected in about 25 per cent. of the cases.

Syphilis is only partially treated in this volume, chancre, &c., appearing among the local diseases. For the administration of mercury, Mr. Bryant employs mercurial suppositories (their composition is not given) twice a day. In addition to that the calomel bath is recommended for some cases.

The chapter on tumours is a thoroughly good one; the description of the microscopical anatomy, by Dr. Moxon, and the woodcuts are about as good as they could be, and the author has given a full account of the views held by the best authorities on the nature and growth of tumours in general. Benign tumours generally have a quiet existence allotted them in this chapter—to the cancerous Mr. Bryant is an unsparing foe.

In treating *carbuncle* the crucial incision is deprecated, caustic potash being employed instead. The same chapter contains much that is useful about such domestic maladies as corns, chilblains, &c.; "nihil humani," the author appears to say, and most medical men will agree with us when we insist upon the importance of knowledge of this kind to surgeon as well as patient.

Injuries of the cranium and its contents receive very full attention, this chapter being one of the best in the volume. Trephining has been performed in fifty-one cases in seven years at Guy's Hospital, but at St. Bartholomew's had not been done at all for six years in 1867. The limits of its employment are thus defined:—1st. To relieve compression of the brain from depressed bone or extravasation of blood. 2nd. To prevent or relieve irritation of the brain or its membrane arising from—(1) depressed bone, (2) inflamed bone, (3) pus between the dura mater and the bone.

The subjects of scalp wounds and diseases, of spinal injuries and diseases, are followed by a chapter on diseases of the eye and its appendages, in preparing which the author was assisted by Mr. Charles Higgins, of Guy's Hospital. The operative portions, and the directions for examining the eye and visual field are given fully. Some parts of the chapter are much condensed.

Dr. Laidlaw Purves, Surgeon Aurist at Guy's Hospital, has contributed to the chapter on ear diseases, which are better described than in works on surgery generally.

In speaking of arterial hæmorrhage, Mr. Bryant decidedly gives preference to torsion, even for the femoral. He speaks favourably of the catgut ligature, which has lately been out of fashion.

In the treatment of aneurisms galvano-puncture has scarcely received its share of notice. Nor is the galvano-caustic treatment of nœons so fully discussed as we should have expected from one who has had such success in this operation. Injection with perchloride of iron solution is still mentioned as a method of treatment of sub-cutaneous nœons, though the writer himself has had a case in which the patient died in a few minutes, and a similar instance occurred in the suburbs of London not many years ago. The veins and arteries in the diagrams of applying ligatures are coloured. Particularly deserving notice is the description of the operation for cleft-palate as modified by Mr. Bryant:—"I first introduce my sutures through the soft palate, taking care to do so a quarter of an inch from the free border of the fissure; and secondly, pare the edges, employing for this purpose a pair of scissors whose blades are bent at right angles to their shanks. By this practice the introduction of the sutures is an easy proceeding. To relieve tension of the parts I now divide the soft palate laterally, the side cuts subsequently gaping so as to appear as arches. In this way the muscles of the palate are paralysed, and the soft palate appears as one large uvula. I have now performed the operation just described on six occasions, and in all with immediate success."

In fissures of the hard palate he advises the separation of bone as practised by Sir. W. Fergusson and Mr. Mason.

The next subject is diseases of the jaws and teeth (Mr. Mason having written the very good section relating to dental surgery), affections of the pharynx and œsophagus, injuries of the abdomen, intestinal obstruction (very ably handled), then hernia. Mr. Bryant says that taxis under an anæsthetic should never be employed for femoral hernia for more than two minutes; in inguinal or umbilical five minutes may be allowed; in inguinal hernia, chloroform and the taxis are usually successful. (We ourselves have never operated on an inguinal hernia; all the cases requiring herniotomy have been femoral).

When a surgeon is called to a strangulated hernia, is he never to give time for the application of ice, or for his injection of morphia, or his large doses of opium, to act? Apparently not, for the taxis failing, Mr. Bryant says, operate at once, first in his system of saying, allows time (no exact period—"some hours") to elapse before proceeding to the operation; but he is a strong believer in the efficacy of the taxis.

In the chapter on surgery of the anus and rectum, nothing calls for special notice. For hæmorrhoids the clamp and galvanic cautery are preferred. The nose, larynx, trachea, thorax, kidneys, and bladder, are surgically treated in the following chapters.

Stone in the bladder forms the subject of a long article of nearly fifty pages. An excellent mode of washing out the bladder is described, and is the subject of a woodcut. An india-rubber tube is at one end slipped over the free end of a large catheter (passed into the bladder), and the

other end of the tube is fitted with a small funnel. Three or four ounces of water, dilute acid or other fluid, are then poured into the funnel, whose height above the level of the bladder will nicely regulate the force of the fluid pressure; and to empty the bladder again it is only necessary to depress the tube and funnel below the patient's body, when the apparatus acts like a syphon.

In *crushing calculi* Mr. Bryant adopts the English method—viz., to keep the convex part of the lithotrite against the posterior surface of the bladder, and then opening the blades, to let the stone fall between the blades.

Lithotomy at Guy's Hospital has had a very successful career. "During the last seventeen years 100 patients have been cut consecutively without a single death." This "must in a measure, if not altogether, be put down to the greater safety of Key's operation. The peculiarity of this method seems to be in great degree connected with the use of a *straight* staff with a very deep groove. The surgeon holds the staff himself while making the bladder incision.

For the removal of calculis from the female bladder the author recommends rapid dilatation of the urethra, but condemns any slow dilatation, and any incision into the neck of the bladder.

Gradual dilatation is the method of treating *stricture* of the male *urethra*. An elastic conical catheter, with a bulbous end, being tied in, is exchanged daily for one of a larger size, full dilatation is to be expected in about ten days. Rapid dilatation and internal urethrotomy are both to be exceptional operations, more adapted for ring penile strictures than for permæal. This important chapter is followed by one on affections of the *genital organs*, commencing with the penis (phymosis, hypospadias, cancer, &c.) In the treatment of gonorrhœa the writer insists on frequency of injection, tannin being the best astringent for the purpose.

Chancre, affections of the tunica vaginalis and cord, bubo, &c., are next considered, and then inflammation of the testicle, first insisting on the distinctness of the body of the testis and the epididymus. Mr. Bryant speaks of the hydrocele which often complicates epididymitis, and leads the surgeon to regard the testis itself as swollen as due to the anatomical connection cellular tissue of the T. vaginalis and that of the epididimis. The T. albrigenca arrests the progress of the inflammation to the testis itself (quoted by Curling from Gendrin).

In the treatment of this disease the author uses the ordinary remedies—viz., opium, saline purgatives, rest, and pressure for removal of inflammatory products. "Vidal's plan of puncturing the T. vaginalis, or even the testis itself, has been freely practised by some English surgeons. I have never seen a case calling for so severe a measure." "I should hesitate to puncture the testicle unless suppuration were present." Why puncture the *sestis* at all for *epididymitis?*

A full account of the morbid anatomy of cystic disease of the testicle is given. Many cysts "varying in size from that of a mustard seed to that of a moderate-sized nut, filled with their serous blood-stained, or glairy fluid imbedded in a fibrous stroma." "The true secreting portion of the testicle will also be found pushed up into one corner of the tumour."

A table of important points in the diagnosis of chronic diseases of the testicles will prove useful to students. In the treatment of varicocele Mr. Bryant employs subcutaneous ligature with fine whip-cord.

The articles on mammary and ovarian tumours will repay the reader for careful study. The attention of young ovariotomists is called to a quotation from Cruveilher, that "even success does not always justify rash enterprises." The writer concludes that long ovarian pedicles are best clamped, and that short and broad pedicles should be treated with the cautery, or tied in several parts, and dropped into the abdomen.

We have never seen the subject of fractures and dislocations better treated. The illustrations are numerous, and, on the whole, good. In diagnosis of hip injuries Mr. Bryant points out the value of the ilio-femoral triangle, which he has described. It is a right-angled triangle, the apex being the anterior superior spinous process of the ilium. A vertical line led full from this point, a horizontal line running backwards from the trochanter (the patient is supposed to be lying down) to meet this vertical line, and a line from the anterior spinous process to the top of the trochanter major, form the three sides. The *test line* is the horizontal one, and if shortened it indicates fracture of the neck of the thigh bone, impacted or otherwise. In treating fracture of the clavicle, the scapulæis to be fixed by a pad, and by broad strips of plaster half encircling the chest, at the same time supporting the arm in a sling, the hand being placed near the other shoulder.

Fracture of the thigh in a child is to be treated with a light splint on the broken leg, which is then (with the sound one) to be hung up at right angles to the body: the weight of the body keeps up extension, and the child is easily kept clean.

Diseases of the joints, with general treatment, and the subject of excision, are considered in the next chapter. Then follow diseases of bone, gunshot injuries (the wounds of small shot seem to have been forgotten), anæsthetics and amputations, in the concluding chapters.

We congratulate the author on having accomplished such a work as the production of these excellent volumes, whose value is enhanced by the fact that they are written in the midst of his career. This is made evident by the freshness and reality of the descriptions of operations, &c. It would be well if all wood engravings in scientific books had, when at all practicable, their descriptions attached to the pictures themselves, as is done in many cases here.

Obituary.

DR. JOHN GAIRDNER.

EDINBURGH has recently lost one of its most venerable citizens in the person of the late Dr. John Gairdner, father of the well-known Professor Gairdner, of Glasgow. Dr. John Gairdner, who had reached the great age of eighty-six, was educated at Edinburgh, where he took his medical degree in 1811. After pursuing his studies for a winter in London, under Mr., afterwards Sir Charles Bell, he commenced practice in Edinburgh, in partnership with Dr. Farquharson. In 1813, he became a Fellow of the Royal College of Surgeons, and afterwards fulfilled the various offices of Examiner, Councillor, Treasurer, and, finally, President of that institution. During his whole life he was very liberal in his views, and for nearly half a century he took a prominent part in every movement that had for its object the advancement of medical education and reform; and he was a strong advocate for the recognition by the University authorities of extra-academical teaching. Mr. Gairdner was also invariably found the staunch friend of free thought, free speech, and free action, though always within the limits of strict reverence for law and authority.

Dr. Gairdner's contributions to medical literature were numerous, but rather of a fugitive character. A few years ago he wrote in the *Edinburgh Medical Journal* a history of the ravages of small-pox among the royal families of Europe, in the century preceding the introduction of vaccination. This paper was one of great merit, and might well be in the hands of many who talk so lightly of this disease, and of the benefits conferred upon humanity by Jenner's great discovery. He also wrote a "Calendar" for calculating dates backwards and forwards indefinitely, and an historical sketch of the College of Surgeons.

THE Local Government Board has declined to accept of the resignation of nine Keighley guardians opposed to vaccination.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 3, 1877.

THE ANNUS MEDICUS, 1876.

ACCORDING to our usual custom, at the end of the year, we propose to lay before our readers a brief epitome of the more important events that have characterised the progress of medicine during the last twelve months. We cannot say that anything very remarkable has occurred as regards either the services of medicine and surgery, or the profession itself. Art is long, and if we chronicle the events which have marked our progress for the last twelve months only, they must necessarily be insignificantly small, both in number and in importance. This reflection, however, must not make us hesitate to take a cheerful retrospect of the past. It should merely prevent us from entering into common-place details, and induce us to hit off a faithful sketch rather than an elaborate picture of the medical events that have transpired since the beginning of the year.

And perhaps the great medical corporations and societies may first claim our attention, although they do not in many respects stand first in point of importance. The Medical Council, which has all along done so little to advance either the cause of medical education or the interests of the profession at large, met unusually early in the year. They did little, however, to redeem their old character for lengthy discussions and lack of good practical work. Most of their time was occupied in discussing such questions as the registration of women holding foreign degrees, and the notorious Vivisection Bill. Dr. Haldane and Dr. Andrew Wood drew the attention of the Council to the deficiency of the tests of the preliminary education of candidates, but the consideration of this and other subjects relative to medical education and examination had to be postponed to the next meeting. In connection with this body, we may notice the resignation of their Registrar, Dr. Francis Hawkins, and the recent election, in his place, of Mr. Miller, B.A., and Vice-Principal of Huddersfield College, but who is not a medical man. We believe that this selection by the Council's Executive Committee of a layman, when there were so many members of the profession eligible for the post, has given very general dissatisfaction, and we ourselves very recently took the opportunity of animadverting upon the impropriety of such a course.

We cannot say that the affairs of the College of Physicians have during the past twelve months been signalised by any notable event. They have, however, taken an active part in furthering the Conjoint Scheme; and they settled a question that was continually cropping up—namely, the right of fellows and members to a courtesy title of "Dr.." It is now ruled that no fellow, member, or licentiate is entitled to append to his name the title of M.D. unless he has obtained a degree in medicine from a university. We may also note that the Croonian Lectures, by Dr. Howship Dickinson, on "The Pathology and Relations of Albuminuria" were above the average in merit, as were also the Gulstonian Lectures, by Dr. Shepherd, on "The Natural History of Consumption." This year was also signalised in the annals of the College by the elevation of an Edinburgh graduate to the Presidency, by the delivery by Sir Wm. Jenner of the Harveian Oration, which Dr. Parkes had prepared just before his death; and by the College being called upon to settle the difference which arose between Sir William Gull and Dr. George Johnson in connection with the late Bravo case. There is, perhaps, no corporation which has lately exerted itself more in behalf of medical reform and medical education than the Royal College of Surgeons. The College has not only heartily co-operated with the other examining bodies in the formation of a Conjoint Board, when such co-operation might entail nothing less than a great falling off of their *prestige* and a great reduction in their funds, but they have likewise made some important alterations in the mode of conducting their examinations. They have now a separate Board of Examiners in Anatomy and Physiology. They have very much modified the qualifications they require of, and the examinations they impose upon, candidates for the fellowship. One of the most remarkable events, however, not only in the transactions of the College, but in the annals of medicine itself, was the granting to women the right of presenting themselves for examination for the College certificate to practise midwifery. Considering the great prejudice raised against the admission of women into the medical profession, we are not surprised that such a concession led to a spirited protest on the part of the Obstetrical Society, and to the resignations of Drs. Barnes, Priestley, and Farre, who had constituted their Board of Examiners in Midwifery. This step, however, was one that was in a great measure forced upon the College authorities, inasmuch as they were more bound by the provisions of their charter than moved by their own inclinations, and they found that they had no power to withhold their qualification in midwifery from any "person," male or female, who had complied with the necessary regulations. With regard to the Apothecaries Hall there is little to be said, but that little is, as it always has been, to their credit. Although they have not this year made any marked

alterations in their examinations, they continue, as heretofore, to exact from the candidates for their license a fair and practical knowledge of the many subjects on which they are examined, and while claiming for themselves that amount of consideration which their past services in the cause of medical education have entitled them to, they have from the first shown a great desire to join in the Conjoint Scheme movement.

In passing from the corporations to the *Medical Societies*, our remarks must be brief. The most valuable papers read at the Royal Medical and Chirurgical Society were that of Sir James Paget on "Osteitis Deformans," that of Dr. Galabin on the "Water-hammer Pulse," and three papers on "Morbid Histology," by Mr. Batlin, Dr. Gower, and Dr. Thin, respectively. The society has also appointed a committee of inquiry into the question of identity or non-identity of croup and diphtheria, a question which was, we believe, first raised at the Society by a paper that was read on the subject by Dr. Semple. Some instructive and interesting cases have been submitted for discussion by the Clinical Society, among which we may mention fatal epileptiform convulsions following the performance of the operation for empyema, an example of Meniere's disease, hæmophilia, purpura rheumatica, and intestinal obstruction, with the operation of gastro-enterotomy. Nor must we omit to mention the prolonged debate on leucocythæmia and its treatment by phosphorus, on which we recently and fully commented. But of all the discussions at these societies, the most memorable is that which took place at the Pathological Society on "syphilis." Many eminent men joined in a debate which lasted for several evenings, but the novelty of some of the views that were suggested, and the difference of opinion which the discussion elicited, showed how much we have still to learn about the pathology and clinical relationship of this disease. The subject has again received attention at the hands of Mr. James Lane, in the lecture which he recently delivered before the Harveian Society. Lastly, we must not forget one or two important papers that were read at the Medical and Obstetrical Societies. In connection with the latter, a paper on the performance of Cæsarian section in a case of extra-uterine fœtation deserve especial mention, while at the Royal Medical Society the Lettsomiam lectures, by Dr. C. T, Williams, on the "Influence of Climate in the Treatment of Pulmonary Consumption," drew the attention of the profession to the advantages to be derived from a residence at some of our watering-places on the south coast, and to the exaggerated estimate that was often taken of certain foreign and more fashionable resorts.

In passing from our medical corporations and societies to the actual progress that has been made in the various departments of medicine and the collateral sciences, we have reason to be satisfied with the work that has been done. With respect to anatomy and physiology, much new light has been thrown by various observers upon the constitution of the blood and the causes of its coagulation, upon the physiology of the white corpuscles, and especially the mode in which, under certain conditions, they escape from the walls of the blood vessels, upon certain points in connection with the blood pressure, upon some of the more obscure questions with regard to the processes of digestion and assimilation, and upon that very difficult subject the functions of the brain. Of all the physiological researches that have been recently made, there are none so interesting as those which Prof. Ferrier has lately published on the brain and its functions, and an account of which we hope soon to lay before our readers. It will suffice now to say that in this work Prof. Ferrier endeavours to show that different portions of the cortex of the cerebrum are differently excited by the same stimulus, that certain movements invariably follow the application of a stimulus to particular regions of the cortex, and that, in fact, instead of the grey matters of the cerebral convolutions acting, as was formerly supposed, as a whole, it was endowed with certain and isolated motor and sensory centres. In practical medicine we have to note the large amount of attention which the profession has given to the therapeutic virtues of salicin and salicylic acid, and the remarkable success which has apparently attended its use in the treatment of acute rheumatism. This agent has been shown to have great power in reducing the temperature in several febrile diseases; and while its reputation rests chiefly upon the rapidity with which it has arrested many cases of rheumatic fever, it has also been found useful in phthisis, pneumonia, and ague.

In Surgery, the history of the last twelve months has been more remarkable, for uncommon and successful operations, or the successful adoption of new methods of treatment, than for any original practice or discovery. But the successful performance of abdominal section in a case of extra-uterine fœtation, with the preservation of both mother and child; the bold and successful extirpation of the spleen in two cases; the successful ligature of both external iliac arteries for double inguinal aneurisms; the very satisfactory employment in many cases of Esmarch's bandage in the treatment of poplitical aneurism; and the good results of using carbolised catgut in the ligature of arteries in the treatment of aneurism. These, and several other events which we cannot now call to mind, are enough to show that Surgery has kept pace with the progress of other departments of the healing art.

The scope of this article will not allow us to enter here into the subject of Obstetric Medicine, but we may briefly allude to the good work that has been done, and the many interesting papers that have been read at the Obstetrical Society, and to the late successful operation of Cæsarean section, by Dr. Edmunds, in which both the mother and child were saved.

Lastly, in Pathology, we have to chronicle the researches of Dr. Brown-Séquard into the pathology of the nervous system; those of Dr. Burdon Sanderson on the nature and phenomenon of fever; the admirable and original lectures of Dr. Hughlings Jackson on the Scientific and Empirical Investigations of Epilepsies; and those of Charcot on the Pathological Anatomy of the Brain.

In Forensic Medicine there is, as regards the advancement of, or important contributions to that science, little which calls for special comment, but the extraordinary Bravo case, which excited so much public interest, was enough to show the great and practical importance of this science as a branch of medical education, as well as the great care, skill, and circumspection with which all pro-

fessional attendance upon cases of suspected poisoning should be conducted. As respects the part taken by all the medical men in attendance on that case, we must admit that it was most creditable to the science of forensic medicine, and if notwithstanding the prolonged and laboured inquiry into the case. the verdict of the jury was so very unsatisfactory, and the cause of Mr. Bravo's death still remains a mystery, it is not so much the fault of the medical witnesses, or owing to the shortcoming of toxicology, as to the gaps in, or the remarkably conflicting nature of the general evidence.

Considering the great attention now being given to Hygiene, we can scarcely pass over this important department of medicine without a brief allusion to its progress during the last twelve months. This, however, has not been conspicuously great, and has been marked by the active services and scientific contributions of the profession, rather than by any important enactments on the part of the Government. When the present Ministry came into power, they promised to give a large share of their attention to the public health. These promises, however, have not been fulfilled, and the only sanitary Act we have to note is the Rivers Pollution Bill, which, from the way in which it is drawn up, and the very questionable working of it, is generally considered to be a very unsatisfactory one. On the other hand, much good has been done by the profession and the public in the cause of public health. Quite recently we had occasion to call the attention of our readers to a series of lectures on Hygiene, inaugurated by the Trades' Guild of Learning and the National Health Society, as well as to the Sanitary Institute of Great Britain. We have also directed attention to the elaborate reports on cholera by Mr. Nathan Radcliffe, in connection with the equally valuable American Reports on the diffusion of that disease in the United States in 1873. The breaking out of the plague in Mesopotamia, and of small-pox in the metropolis, are also events of the year, which must not altogether be lost sight of.

Within the last few months we have had to notice the assembling of what may be termed two important medical congresses—viz., the great American International Congress and the annual meeting of our own British Medical Association. The former was attended by several eminent representatives of British medicine and surgery; and the outline we have lately given of the chief addresses and papers that were read on the occasion, must, although a faint one, have given the reader a good impression of the general organisation of the Congress, and of the great scientific value of the various papers contributed by its members.

The forty-fourth annual meeting of the British Medical Association was held in Sheffield, and was certainly a successful one, both as regards the character of the addresses and papers read, and the hearty reception which was given to the members by their professional brethren at Sheffield. The address of the President, Dr. De Bartolomé, on the health and social condition of that town, was remarkably interesting and instructive, particularly his observations on the change of type which had, in his opinion, taken place in the diseases of the district in which he lived. The great improvement in the health of the inhabitants he attributed to those great hygienic reforms in drainage, ventilation, water-supply, and buildings for the poor which have recently marked the social progress of many other large towns in England. Dr. Sieveking's address in medicine, although a little open to criticism, was yet a very able and thoughtful one, and we drew particular attention to it at the time of its delivery in an article on the "Polypharmacy" of the past. We may also mention the excellent address in public medicine delivered by Dr. A. Carpenter, of Croydon, who has recently taken such an active part in what may be called a no trifling event of the year—the formation of a Society for the Legal Restraint of Habitual Drunkards. A large part of that address was taken up with his observations and strong argument in favour of the utilisation of sewage, in which he brought forward some remarkable statistical statements with respect to the irrigation on the Croydon Sewage Farm at Beddington.

There are still one or two subjects which we have either omitted or but barely mentioned, such as the great Vivisection question, the Conjoint Scheme, and the new Army Medical Warrant. We do not wish to tresspass upon the attention of the reader by recapitulating the dry and unpleasant history of the Cruelty to Animal's Act. The whole agitation on the subject of vivisection has made too strong an impression upon us, and too effectually excited the disgust of the whole profession, to make any circumstance in connection with that Act easily forgotten. The many editorial articles which we wrote on that painful subject will show that we were among the first to expose the absurdity, the fanaticism, and the party-spirit of that agitation, and to express our surprise that the Government should so far stoop to listen to the unreasonable clamour of an insignificant section of the community as to force upon gentlemen whose humanity has never been questioned, one of the most obnoxious and humiliating Bills that could be passed in reference to a learned profession and a body of scientific men. Fortunately, the profession lost no time in asserting its dignity and protesting against the aspersion brought upon it; and through the influence and exertions of the Medical Council and the British Medical Association, and the temperate but weighty representations of many of the most eminent members of the profession, the Bill was eventually so much modified as to materially rob it of its sting and to enable us to tolerate it until a time arrives when a reaction in the misplaced humanitarianism of the present age shall lead to its total repeal. If the last subject was one on which we avoided entering into details the chequered and complicated history of the Conjoint Scheme is another topic, all the circumstances of which can only command the attention of a few.

It will be recollected that in last March "An Amended Scheme for a Conjoint Examining Board for England" was adopted and the particulars of which will be found in the back numbers of this journal. When this amended scheme was submitted to the consideration of the medical authorities it was found that more or less serious objections were raised by the University of Cambridge, by the College of Physicians, and particularly by the University of London. One of the demands made by the latter University was: "That the Committee of Reference

should consist of representatives to be appointed *in equal numbers* by each of the medical corporations and universities of England." Now, considering the power to be invested in this committee, and considering that only a very small percentage of the general practitioners of England were graduates of a university, it follows that were the above requisitions acceded to, the universities would have a much larger share in the constitution of the Committee of Reference than they could reasonably lay claim to. Indeed, the University of London went further than this, and actually demanded for the universities a majority of representatives in the Committee. This circumstance was very naturally expected to shipwreck the whole scheme, considering that such an alteration would be placing a university (that of Durham), which scarcely granted two or three degrees in the year, on the same footing with those two corporations from which more than 90 per cent. of the profession received their license to practise. Nevertheless, the College of Surgeons, which had already made so many sacrifices and concessions in furtherance of the conjoint scheme, gave way on this point also, and at a meeting of their Council, which met only a month ago, accepted the alterations proposed by the University of London. So at last most of the obstacles that have stood in the way of this much talked-of Conjoint Board have been removed, and it is to be hoped that before the new year is out some scheme, if only of a tentative nature, will be actually put in operation, and an end put to a conflict which has been little short of a scandal to the profession. In the meantime we may observe that, with commendable promptitude, the University of Dubiin and the College of Surgeons and Physicians of Ireland have put forth a conjoint scheme of their own. The full details of this scheme were very recently published in these columns, and we shall now only observe that that want of unanimity among the medical corporations which has been, in England, such a conspicuous feature in the history of this projected reform, has likewise characterised its progress in Ireland, and that the Irish scheme does not include either the Apothecaries' Hall or the Queen's University in Ireland.

With regard to the Government or legislative measures that have been adopted in the interests of the profession or of public medicine, there is little that calls for special comment. We have already alluded to Mr. Russell Gurney's Bill for removing restrictions on the granting of qualifications for registration on the ground of sex, and which was passed on the conditions that the new powers it would grant should be of optional, and not of an obligatory, nature; and that the qualifications it would confer should not involve the right of taking a part in the government, or of exercising any authority in the universities and corporations mentioned in the Medical Act.

The New Army Medical Warrant is another event of the last year. At the time of its publication we took occasion to expose its many weak points, and the serious objections that have been raised against it; and we need scarcely say that it has by no means (as was intended) given satisfaction to the profession—that part of the scheme which related to the short service system being particularly obnoxious to those who propose to enter the service.

We cannot conclude this brief and imperfect outline of the chief events of the past year without referring to a subject in which we were personally—and the whole profession indirectly—concerned. It has always been a principle of medical journalism to do all in its power to support the dignity (and more especially, the respectability) of the profession, and to discountenance and protest in the strongest terms against any act or conduct of its members which may tend to forfeit the respect in which we are usually held by the public, and which we shall always endeavour to deserve. So generally recognised is this rule, that neither professional rivalry, nor the rivalry and jealousy incidental to medical journalism, has stood in the way of acting up to it whenever an opportunity presented itself. That there is no rule without an exception, is as true in medical politics as in every thing else, and consequently we must not be surprised that from the beginning to the end of all the circumstances which culminated in the trial of *Betts* v. *The Medical Press and Circular*, we found ourselves without the least support from the leading representatives of medical opinion, and from those very Medical Associations, one of whose boasts is that they jealously guard the good name and reputation of the profession, and heartily sympathise with all those who endeavour to carry out the principles which they profess. The circumstances of the late trial must be so fresh in the memory of our readers, that it would be unbecoming in us to make, in this place, more than a brief reference to them. Without any personal malice or prejudice, and entirely with the view of protesting against low and disreputable methods of practising a noble and learned profession, we made a few passing comments upon an occurrence which was considered by the plaintiff in the case to be an unmerited reflection upon his character. We were asked to retract and apologise for the remarks which we had made; but in the interests of the public good and of the profession itself, we considered it was our duty not to do so, and not to flinch, whatever might be the consequences, from defending even in a court of law, the course which we thought proper to pursue. But, although the law was against us, and although the loss of time, the trouble, anxiety, and the expenses incurred, were circumstances to which we could not be callous, and although our case was treated with indifference in those very quarters from which we had most reason to expect sympathy and support, we have many reasons to be satisfied with our conduct throughout the whole case, and more especially with the expression of public opinion that has been made in our favour. Even the judge's ruling, although bound by the technical wording of the law, was couched in such terms as to show that his sympathy went with us. The damages were much less than they might have been; while the late meetings of the Profession in London and Dublin, and the handsome sum of money which has already been raised to defray our expenses, are more than sufficient to call forth our gratitude and thanks, and to encourage us to follow in this new year on which we have now entered, and for many coming years, that path of duty which will never lead us far wrong, and from which we shall never swerve.

Notes on Current Topics.

The Anti-Vivisectionists and the Medical Profession.

We last week printed a letter addressed by the Editor of this journal to the Secretary of the Irish Society for Abolition of Vivisection, in which proof was demanded of a published statement made by the Society to the effect that "several leading physicians" in Dublin had "expressed themselves strongly against vivisection;" also a resolution of the Committee declining to afford the desired evidence. In reply to our editorial remarks we have received the following letter:—

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The Committee of the Irish Society for the Abolition of Vivisection have read with much astonishment the article in your Journal of the 20th inst., and forbear from commenting on the tone adopted towards a lady who, whatever she did, acted only under the instructions of the Committee. The public will judge how far any journalist is justified in adopting such a course as you have thought fit to do. As, however, the latter part of the article is a misinterpretation of the resolution of the Committee of the 13th inst., and charges the Committee with having falsified published statements, they have requested me, as their Chairman on the 27th inst., to reply to your article.

1stly. As several medical gentlemen had, in their replies to the letter sent them by the Honorary Secretary of this Society, intimated, as the result of publishing their names, the probability of persecution, the Committee would not put them in that position by disclosing their names as you requested. The Committee had no fear whatever, as you say, of legal responsibility.

2ndly. The Committee finds it difficult to restrain themselves in replying to a charge of falsehood. I am, however, instructed to say that the statements made by the Committee are founded on fact, whilst those in the first half of your first paragraph in the Journal of above date are thoroughly opposed to it.

I am, Sir, your obedient servant,

Alex. Crowder Crookshank.

29 Westmoreland Street, Dublin,
28th December, 1876.

It would appear from this letter that the Committee desired to convey by their resolution that they were restrained from revealing the names of the "leading physicians" who expressed approval of the Society's principles, apprehending that these gentlemen might be subjected to *persecution* by their medical brethren. We desire to preserve the strict limits of courtesy towards the Committee, yet we feel it necessary to express our scepticism as to the statement that any "leading" physician apprehended "persecution" from his medical brethren for making known his objection to vivisection, or desiring secrecy on any such ground. It would be impolite in face of the statement of the chairman that the boasted adhesion of leading physicians was "founded on fact," to express a belief that no physician at all approves of the principles of the Society. Opinions may, however, differ as to what is a "leading" physician, and what is a "strong" expression of opinion, and until the Committee gives the public a chance of forming their own opinions on these points, we very distinctly express our disbelief in their published statements.

The Editor has therefore replied by the following letter:—

Medical Press and Circular.
Dec. 27, 1876.

The Editor begs to acknowledge receipt of letter of the Chairman of the Irish Society for the Abolition of Vivisection, under date 28th ult.

Replying thereto, the Editor maintains the opinion that a journalist is perfectly justified, and that it is his duty to call for proof of a statement made by a public body whenever he has reason to suppose that that statement is not strictly accurate. In pursuance of that duty the Editor again requests to be furnished with the information asked for in his letter of the 4th inst., and begs to repeat that if the Society—having assigned no valid cause for such refusal—shall decline to substantiate the assertion that "several of the leading physicians" have expressed themselves "strongly opposed to vivisection," or shall fail to show that—as inferred by their report—the medical profession approves of the principles of the Society, the Editor will maintain the belief that neither statement—however true in a modified sense—can be proved to the full extent.

The Editor begs to observe that the approval of the Society's principles by "leading physicians" who lack the courage to declare their convictions, and desire that their names should be kept secret, would be of no value whatever as a demonstration in favour of the total abolition of vivisection. The question may, therefore, be dealt with as if such "leading physicians" did not exist, and the Editor, therefore, waives the request for their names, but again challenges the production of the statistics respecting the replies to the Society's circular.

If the Chairman should favour the Editor with the information it will be as well to point out any statement in the first part of the editorial article of the 20th, which "thoroughly opposed to" fact.

Apropos of the Chairman's letter, we are amused to observe that the assembly of the Irish Society for the Total Abolition of Vivisection, at which the condemnation of the Medical Press and Circular was decreed, consisted of two clergymen and the Secretary of the Cruelty to Animals Society, besides the Chairman and Secretary of the Anti-vivisection Society. In assessing the importance of future placard manifestos of the Dublin Anti-vivisectionists it will be as well for the public to recollect the numerical and intellectual strength of the *junto* from whom the proclamations emanate.

Progress of the Small-pox Epidemic.

At the fortnightly meeting of the managers of the Metropolitan Asylums on Saturday last, Dr. Brewer presiding, reports were presented from the various hospitals of a rather alarming nature, and there was a strong feeling that prompt action must be taken to provide further accommodation for patients. The report from Stockwell Hospital showed that whilst accommodation had been provided for 150 patients, there were 152 in the establishment. At Homerton the provision in the small-pox hospital was for 140, and there were 143, and there were also 233 in the Fever Hospital appropriated to small-pox, the accommodation being for 236. At the Hampstead Hospital the accommodation was but for 300, and there were 285. So that of the 826 beds the managers had provided for small-pox patients, 813 were filled, and further demands were apprehended. A resolution was carried by the Board to the effect that although every effort is being made by the managers to prepare the hospitals at Deptford and

Fulham as quickly as possible, in view of the existing pressure for accommodation for small-pox cases, the clerk be directed to request the Local Government Board to inform the managers what replies have been received from the several boards of guardians as to the accommodation they have prepared, or are prepared to make, for pauper cases.

The Capacities of the Human Stomach.

EMINENT medical men and physiologists have, before now, occupied themselves, remarks our contemporary *The Observer*, with an elaborate calculation of what may be called the capacity of the human stomach, and have estimated its containing power at something like two quarts. It would seem, however, from some interesting revelations made at the Bow Street Police-court on Friday last, that the capacity of the human stomach is very much what it can be made to hold. According to some evidence given before the magistrate, it seems that four gentlemen (?) between them got through four bottles of wine before lunch; ate lunch and dinner with a not particularly moderate quantity of liquor of various kinds at each of these meals, and then returned from dinner at midnight, and sat up from twelve to three, drinking champagne and brandy and soda, *ad libitum*. On the 24th November last, however, this same quartet fairly eclipsed its previous performances, for the four between them disposed of forty large glasses of pale brandy, thirty-seven small glasses of the same generous fluid, nine bottles of champagne, and twenty-six bottles of soda-water. All this, it must be remembered, was in the way of "nips" between meals, and did not include that reasonable allowance of liquor which is the natural accompaniment of breakfast, luncheon, dinner, and supper. These libations seemed to have been varied by sandwiches, composed sometimes of anchovy, sometimes of caviare, sometimes of devilled eggs, and sometimes of hot pickles. They won't have the privilege of repeating these highly intellectual performances for the next few weeks!

Fraudulent Death Certificates.

IN the Thames Police-court, Mr. Coward, L.F.P.S., Glasgow, and L.S.A., was last week charged by the East London Medical Defence Association, under the Registration of Births and Deaths Act, with furnishing a false certificate to one of the sub-registrars of deaths for the purpose of procuring the registration of the cause of death of a child named Lucy Moore. Mr. Pridham prosecuted, and Mr. Lewis defended. Mr. Pridham said that the system of giving false certificates of the cause of deaths was so dangerous to the interests of the public, and prevailed so extensively in London, that, with a view of checking so reprehensible a practice, the Association for whom he appeared had, after much consideration and reluctance, determined to prosecute in some of the cases already brought under their notice, and that neither prejudice nor personal feeling were imported into the complaint he was then making. It appeared that Mr. Coward kept a "dispensary," where an unqualified assistant, named Jackson, resided. On the 26th ultimo the child was taken to the said "dispensary," where it was seen and prescribed for by Jackson; four days afterwards it suddenly became worse, and a message was at once sent to request Mr. Coward's attendance, but, instead of visiting the child, he sent it some medicine, shortly after taking the first dose of which it died. Subsequently, although Mr. Coward had never seen the child, he gave a certificate stating that he had attended it on the day that it had been seen by Jackson, and that the cause of death was "bronchitis." This constituted the offence complained of. Mr. Lewis stated, in defence of his client, that one of the rules of Mr. Coward's "Dispensary" was that messages for home attendance should be forwarded before eleven a.m., but that in the present case the message was delivered in the evening; that Mr. Coward was under the impression that he had seen the child, and had given the certificate inadvertently. The magistrate thought it possible that Mr. Coward might have believed he had seen the child, and dismissed the summons.

Alleged Hospital Neglect.

How frequently our readers must have remarked the flippancy with which coroners' juries bring paltry charges against hospital authorities. A few days ago, Mr. Donaldson concluded an inquiry at the Champion Tavern, Weymouth Terrace, Hackney Road, respecting the death of James Poole, aged 59 years, whose death was alleged to have been accelerated by neglect at St. Bartholomew's Hospital. The deceased, who lived at 4 Nichol's Square Hackney Road, was a labourer, in the employ of Mr. George Pritchard, Paul Street, Finsbury. On the 6th ult. he left home in good health, at five o'clock in the morning, to go to work, and was brought home in a cab the same evening injured. He said while working at Messrs. Tyler's, in Newgate Street, in placing a boiler, the plank broke and he was hurled into the coal-cellar. He was taken to the hospital and told to go home. Dr. Fowler, who attended deceased at his residence, proved that death took place on the 16th from a fracture of the skull. Mr. Herbert Weiss, house-surgeon at St. Bartholomew's Hospital, and Mr. Clarke, dresser at the same institution, said all was done for deceased that was possible. He was asked to remain, but refused. Mr. Weiss was of opinion that deceased was suffering from some internal injuries to the head, then impossible to detect. Seedon Goleby, a bricklayer, who accompanied deceased to the hospital, said that neither the dresser nor surgeon asked him to remain. The jury returned a verdict that deceased died from injuries received by the breaking of a plank, but how caused there was no evidence to show; and they likewise remarked that the hospital people should attend better to their patients.

This reflection of the jury upon the conduct of the medical officers of the above hospital was perfectly uncalled for. The great probability is that this man did refuse to remain in the hospital, inasmuch as there are few members of the working classes who will stop in a hospital, if they think they can get on as well at home. But even if the medical officer did tell him to go home, it does not follow that he was neglected. The symptoms were not shown to be of such a severe nature as to warrant his detention in the hospital, and therefore we think that the medical officers are quite exonerated from any blame in the matter.

Death Certificates by Unregistered Practitioners.

In a recent report by Dr. T. Orme Dudfield, Medical Officer of Health for Kensington, it is stated that no fewer than six deaths were certified by unregistered practitioners—viz., one by a practitioner who was lately successfully prosecuted under the provisions of the Medical Act of 1858, and five by "another practitioner, who evidently enjoys a large practice, and against whom no proceedings thus far have been taken for the infringement of the Act."

A Benefactor to Charities.

It is given to but few men to amass nearly half a million of money, to still fewer the large-heartedness of the late Mr. George Moore (of the City of London, and Whitehall, Cumberland), to dispense his wealth liberally during life, and to leave a legacy roll at death of £120,000 to charities. Of this magnificent sum, medical charities come in for a fair share. The Royal Free Hospital receives £3,000. University College Hospital, Middlesex Hospital, St. George's Hospital, Charing Cross Hospital, St. Mary's Hospital, Paddington, the London Hospital, Royal Hospital for Incurables, British Home for Incurables, Asylum for Idiots, Redhill, each receive £2,000. The City of London Hospital for Diseases of the Chest, Victoria Park, and the Brompton Consumption Hospital, £1,500 each. The Cancer Hospital, Cumberland Convalescent Institution, Royal Sea Bathing Infirmary, Margate, the Newport Consumption Hospital, and the Whitehaven Infirmary, £1,000. The Carlisle Fever Hospital, and the Cumberland Infirmary, £500 each. The City of London Truss Society, £200, besides £20,000 to found an Orphanage, and about £70,000 to other charitable institutions.

The Outbreak of Fever in H.M.S. "Valiant" at Foynes.

In reference to the epidemic of fever in the *Valiant*, to which we referred last week, a long correspondence was read at the last meeting of the Limerick Guardians, among which was the following telegram from the Local Government Board to Mr. Connolly, law adviser of the Corporation, in reply to his query, "If her Majesty's ships are exempt from the operation of section 2, making a ship accessible for the purposes of the Nuisance Removal Acts, as if it were a house?" The Local Government replied that Foynes, where the *Valiant* is stationed, is within the port nuisance authority. The Local Government Board are not aware that the Urban Sanitary authority has power to prevent the reception of fever cases sent from her Majesty's ship *Valiant* for admission into the St. John's Fever Hospital.

It was understood that no more of the patients would be sent from the ship to Limerick, and the matter dropped. We understand that the epidemic is at an end, and the cases all convalescent.

Last week the temperature registered two degrees higher than in the middle of June and the end of August. It is said that such extreme mildness in mid-winter has never before been chronicled.

The Irish Zoological Society.

We observe that this Institution is again in a condition of begging, which for a scientific body which receives an annual parliamentary grant, and sometime since received £6,000 for new buildings, is a somewhat undignified position. That it is so placed is not wonderful. Persistent mismanagement and extravagance of administration, extending over a long series of years, brought the Society, not for the first time, to a state of semi-bankruptcy. Having no money at their bankers, and most scanty attractions in their gardens—the inducement to the public to visit them being almost *nil*, and the value given for the admission fee being continuously less and less—the Council came to the sensible determination of doubling the price of the ticket. By this expedient, the access of the working classes to the Gardens was effectually cut off—the number of visitors was reduced by about cent. per cent., and the income was not at all materially increased. On the contrary, the existence of the Society has been almost forgotten in Dublin, and its income is mainly derived from the few visitors, who—coming to Dublin to "see the lions"—discover in the Guide-books the presence of a Zoological Garden, and not being aware how little value for their shilling the Society offers them, confidingly visit the Collection (!) of Animals.

We ask the attention of the Council to their past experience, with a view to future amendment. They have tried slip-slop management—enormous outlay on a few very expensive and delicate animals—and, to meet the deficit, clamorous begging and increase of admission fees. These expedients, the Council will admit, have failed. Suppose they try the opposite plan. Let them manage the Gardens on careful commercial principles, and farm their estate as any one of them would do if it were his own. Let them reduce expenses of maintenance and establishment. Fill the empty cages with cheap but interesting animals, the death of which will not ruin the Society; reduce the admission fee to its former amount, and—to be brief—popularise the Gardens on the Continental principle. If they can bring themselves to this change of policy, we will promise them the luxury of being obliged no longer either to beg or starve.

St. Stephen's Green, Dublin.

It seems probable that the munificent offer of Sir Arthur Guinness to throw open St. Stephen's Green to the public at his own expense may yet be carried into effect. It will be recollected that the Dublin Corporation resisted this as they resist every other proposition for the benefit of the citizens into which they are not allowed to put a finger, and, inasmuch as the Commissioners in whom the Square is vested, peremptorily refused to allow the Municipal Council to touch it, the proposal of Sir Arthur Guinness had been withdrawn. It is gratifying to be able to record that—under the persuasion of a Bill in Chancery, and through the good offices of the Lord Mayor, Sir G. B. Owens—an understanding has been come to, Sir Arthur Guinness has renewed his offer. The Commissioners have agreed to yield their title. The Corporation have consented to surrender a small head rent payable to them, and it only remains for the Gb-

vernment to provide for its maintenance as a public park after it has been reconstructed by Sir A. Guinness.

As the Board of Works had already agreed to bear half the annual cost, it is to be hoped that the small extra yearly grant will not stand in the way of this much-needed improvement.

Using a Carpenter's Auger to Perforate.

THE *Melbourne Medical Record* publishes the case of a woman, who was about to be confined. The local practitioner was called in, and found that he was unable to deliver the child alive. After breaking one of his instruments in operating, he got an inch auger, which he introduced, in order to open the head of the child. The skull, however, was too hard to yield, and Dr. Griffith, finding that he could do nothing, told the family to get another doctor. Another was accordingly sent for the same night, and he brought the child forth alive within half-an-hour of his arrival; but the infant was so badly injured about the head that it died. The poor woman was so much lacerated that she died some hours before the child. An inquest was held on the remains of the deceased woman; when, from the evidence adduced, the coroner committed the first practitioner to take his trial for manslaughter at the next Court of General Sessions, Ballarat.

English Doctors in France.

A CORRESPONDENT writes from Paris to the *Pall Mall Gazette*:—"A measure is now in process here which very much interests the travelling English public, and especially those who—from motives of health, or other reasons—propose to themselves from time to time to sojourn in France. It is no less than a law which will in its effect prove, and is really by its professional promoters intended to prove, prohibitive of the practice of medicine in France by British or other foreign physicians, however eminent or capable. Existing rights of practitioners already in possession of practice at health resorts and in Paris will be respected; but after a certain date no British physician will be allowed to take up his residence in France as such, not even if he desire and intend to limit his practice to his own sick countrymen and countrywomen. The 'privileges' of practice are henceforth to be the exclusive possession of graduates of French universities: and if Jenner or Paget desire to come here to see an English patient whom they have sent to recruit at Cannes or Pau, they must first pass five examinations, several of them of an elementary character, and must 'justify' their preliminary education.

"An early result must be—to diminish very much the popularity of French health resorts for foreign invalids, and to limit everywhere in France the number of foreign residents. It is not too much to say that many of the French towns are under the deepest obligations to British physicians for the vogue which they have given to them; and that neither Paris, Cannes, Hyères, nor Tours can afford to neglect that consideration, any more than Mentone or Nice. It is, however, eminently characteristic of the singularly narrow and almost blind egotism of the University officials here, and illustrates remarkably the spirit which has dictated the law by which English invalids in France are in future prohibited from dying or from recovering except under the care of French graduates of medicines."

The American Leech Trade.

THE *Druggists' Circular* gives the following interesting details of the trade in leeches, derived from an interview with one of the most experienced dealers:—

"The American leech (he said) I believe to be utterly valueless. I have received fine-looking specimens from Mississippi and Pennsylvania, but I found them wholly worthless. They are far inferior to even some European varieties of the hirudo decora, which cannot easily be induced to bite unless blood be drawn to excite them. I consider six Swedish leeches equal to at least one hundred of any American variety. Those exported to America are generally full of blood, and at Rhode Island there are immense purging ponds in which the newly arrived leeches are placed, and left to digest their last meal. Until it has been perfectly digested they are useless. These ponds belong to Mr. Witte, who does nearly all the importing for American leech doctors, and he charges an extra price for the ponded leech, because the leeches must remain at least a year in the purging pond. It takes a year for them to get rid of one good meal. The leech can live on almost nothing; its vitality is absolutely prodigious. But it is a curious thing that they are constitutionally delicate creatures. If deprived for a considerable time of clay or turf to burrow in, they are liable to disease. They are carried off by epidemics peculiar to leech life, some of which appear to be skin diseases. I have to nurse them pretty carefully, and when I find one leech sick I put him in the leech hospital. A milk diet frequently restores sick leeches to perfect health."

Sanitary Institute of Great Britain.

THE above Institution was inaugurated in July, for the purpose of "Collecting and imparting Information upon all matters connected with the subject of Public Health."

The following are among the subjects which the sub-committees appointed by the Institute will be, or have already been, considered and reported upon:—1. The Examination of and granting Certificates of Qualification to Subordinate Officers of Sanitary Districts. With respect to these examinations many important suggestions have been made, and a Board of Examiners will be appointed to carry out the object in view, such board to consist of members of the Institute representing Preventive Medicine, Chemistry, Engineering, and Sanitary Jurisprudence. 2. Matters relating to Medicine in connection with Public Health. Under this section the Institute proposes to take steps to obtain complete Registration of Sickness, especially of zymotic disease, and to get Lectures delivered by properly qualified men on subjects relating to the prevention and spread of disease. 3. This section embraces Matters relating to Chemistry in connection with the Public Health. Under this heading it is proposed to investigate the chemical aspects of, and to furnish reports upon, the process for the disposal, deodorisation, or utilisation of sewage, &c., as well as for the suppression or mitigation of any nuisance from factories, chemical works, or noxious trades. It is also proposed to under-

take analysis or other work which may interfere with the private practice of chemists, engineers, or other professional men, &c. 4. Another object they have in view is the Establishment in London of an Exhibition of Sanitary Apparatus and Appliances.

We have not the least doubt but that this Institution will lend very valuable assistance in the cause of public health, and supplement, with great advantage to the public, the labours of the Government and various local authorities.

Professor Macleod on Hydrophobia.

THE following remarks of Professor Macleod, of Glasgow, on hydrophobia, have been going the round of the papers; and certainly too much publicity cannot be given to a subject on which there is much ignorance, and which often gives rise to an amount of terror that is out of proportion to the causes which provoked it. It was remarkable, said the Professor, that all of a sudden there should have arisen in Glasgow a disease which none of the members of the medical profession there had ever seen before. The disease was one very difficult to propagate. He would not care though a mad dog bit him through the clothes, because the animal's teeth would be cleaned, and there would be no fear of any bad results. It was foolish to destroy a dog which had bitten a person, because many men had been brought as from a bed of death by being shown the dogs that bit them. The first patient, in the Western Infirmary, had told him that he was perfectly well until one day he took up a newspaper and read of a man that had died of hydrophobia, and he was never of any use from that moment. The second told him exactly the same thing; and Sergeant M'Gilvray informed him that his mind was haunted night and day by the bite he received, knowing, as he did, that people had died from hydrophobia, till, at last, he had those extraordinary symptoms, which seemed really as much mental as bodily. There was a huge lot of nonsense talked about hydrophobia, and they need not be afraid of it. If they tried for twenty-five years, the chances were they would not see any more of it in the city. Hundreds of people had been bitten in Glasgow during the last few months, and there had been only three, if these were, as he thought they were, cases of hydrophobia. None of the men who died had any fear of water. They took hold of the cup containing water, but the moment the cup touched their lips, it produced a spasm, which sometimes made them throw it from them, not from horror of the water, but from fear of the spasm.

We may supplement these remarks by observing that it is not everybody bitten by a mad dog who is attacked with hydrophobia. Mr. Youatt, who was a great authority on the subject, had himself been bitten several times by mad dogs, and although he did nothing but apply some *nitrate of silver* to the wound, no evil effect resulted. People were not aware of this fact, but think that everyone bitten by a rabid animal must necessarily go mad, and that there is no hope of escaping this dreadful malady. Despair, therefore, aggravates their case, and either disposes them to contract a disease they would otherwise avoid or excites that simulated form of hydrophobia to which Professor Macleod refers.

A Cause of Typhoid Fever.

IN one case mentioned by Dr. Dudfield, in his recent report on the health of Kensington, the disease was traced to sewer-gas escaping from a soil-pipe, constructed of glazed earthenware pipes, chased into a wall, and thinly covered with plaster. The smell was very offensive, and on examination it was found that the joints of the pipe had never been closed. Dr. Dudfield very justly remarks that it is a pernicious as well as usual practice to embed soil-pipes in the thickness of walls, to the common danger of two households. Unless the pipe is external to the house, no material but lead can be safely used for such a purpose.

THE epidemic of typhus fever, which has been raging in Paris for so many weeks past, is now on the decline.

WE understand that a Committee of Inquiry will be appointed by the Admiralty to inquire into the causes of the outbreak of scurvy in the late Arctic Expedition.

TYPHUS fever has, a Berlin correspondent says, broken out at Warsaw in an epidemic form, necessitating the removal of the troops from the parts affected.

THE serious character of the present small-pox epidemic has caused the several boards of guardians in London to suspend the ordinary visitation of friends to workhouse and pauper schools.

THE past year was not a prolific one in the publication of medical and surgical works in the United Kingdom. Including new editions of old books and new books, and pamphlets in all branches of our art, the number only reached one hundred and eighty-one.

A REUTER'S telegram brings news dated Gibraltar, December 26th, according to which small-pox has appeared in an epidemic form among the flocks of goats near Los Barrios. A competent person has been appointed to visit the district, and report thereon.

THE late Mr. William Baillie, of Falahill, W.S., has bequeathed to the Edinburgh Royal Infirmary his estate at Falahill; also a half of the free residue of his estate. Mr. Baillie's agent report that the value of the gift will be upwards of £30,000.

WE understand that the Medical Defence Association have in their possession upwards of fifty false certificates of deaths, given both by qualified and unqualified practitioners in the metropolis; many of these will form the grounds for prosecution.

THE appeal of "Dr." Slade, the Spiritualist, against his conviction to three months' imprisonment, comes on for hearing during the next few days. The Government having undertaken the prosecution, the National Association of Spiritualists have memorialised the Home Secretary against such a course of procedure.

ON Monday, at the Hampton Petty Sessions, the Local

Board were summoned for penalties amounting to £122,300, for having neglected to cut off their sewage from entering the Thames. As, however, the Board had done all in their power to get out of their difficulty, and a Government inquiry was to be held, the summons was adjourned for six months.

A MEDICAL man of the name of James was lately murdered on the coast of New Guinea. In attempting to land, the natives discharged a shower of arrows, killing the doctor and the captain immediately. There is some mystery about the affair. The native crew of the vessel state that they buried the bodies on the coast, and then sailed to the place they started from—Somerset, Australia.

Correspondence.

ON THE ABUSE OF MEDICAL CERTIFICATES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The initials placed after the name of every medical practitioner have a certain recognised and just value with the public, but these initials acquire an additional increment of value when appended to the names of eminent and recognised leaders of our profession.

A. B., a F.R.C.S. in practice in a provincial town, may be a highly-accomplished, intellectual, and scientific member of our profession, and his opinion *per se* may be equal to that of C. D., a F.R.C.S., who practises in London.

But the latter, through his connection with a London school of medicine and hospital, will enjoy a larger clientele and a wider reputation, and a certificate signed by his name will carry more weight than that of his provincial brother with the public, who, not understanding the value of degrees, bow down to the weight of a famous name.

Human nature with her weaknesses, and modern civilisation her offspring, and fashion a near relative, unfortunately make this fact too true, and popular opinion or fashion, running in grooves, adopts without hesitation some new-fangled theory broached by Sir Somebody Something, F.R.Z., or a new and *outré* style of dress introduced by her Royal Highness Princess H——, or injures its digestion by eating some article of food, or drinking some form of alcohol recommended by the authority of some well known analytical chemist after whose name a long list of cabalistic letters are flourished.

The public is not a reasoning animal, though there are amongst it a number of sensible, well-balanced minds who look calmly on these popular ebullitions of fancy, and quietly wait for the pendulum of popular opinion to regain its normal beat. Amongst this latter class we must reckon medical practitioners who have very great influence in directing education and popular prejudices, as they have to deal with sanitary requirements, exercise, amusements, and especially food.

They have a serious responsibility in recommending various forms of dress, exercise, and amusements, but they have a much more serious duty to discharge when dealing with articles of diet.

We are thus led on to the abuse of medical certificates, and we think we have fair grounds for pointing out to our medical friends the necessity of using their power carefully, and to warn them against the blandishments and insinuating eloquence of vendors of novelties either in the shape of farinaceous foods or wines.

We cannot take up our daily paper but we find medical certificates vouching either for the curative properties of certain remedies, or the nutritive value of certain forms of food and drink.

We can give typical instances of how these certificates may be abused.

X. Y. Z., a distinguished analytical chemist, is sent a sample bottle of wine or whiskey; he analyses it carefully and conscientiously

He sends to the vendor a report of the character and quality, which is published, largely advertised, and this wine or whiskey, owing to the high position of the analyst, enjoys a large sale.

What guarantee has the purchaser that the wine with which he is furnished is of the same quality as that which was originally analysed? He has none, save depending on the *honesty* of the dealer. This certificate may be kept in operation for years, though the original wine has been all consumed; and though the original proprietor may die, his successor may still trade on his name and reputation.

The following is an instructive case, taken from the law reports, equity cases, 1873-1874, vol. xvii. :—

In 1855 a Mr. Raggett purchased from Messrs. Blockey their business as brewers and vendors of stout. In 1860 Dr. Hassall analysed it and approved of it. Raggett thereupon registered a trade label with the words "Nourishing *London* stout" round the circumference, and in the centre the words "Raggett, late Blockey, analysed and reported on by Dr. Hassall."

There were agents for the sale of this stout in various towns, and it had an extensive sale.

Messrs. Findlater, of London and Brighton, also advertised a "nourishing stout," with a label, "Bottled by Findlater, Mackie, and Co., Prince Albert Street, Brighton." Raggett filed a bill in 1871 to restrain Findlater from using the word "nourishing."

We cannot do better than quote the words of Sir R. Malins, Vice-Chancellor, pages 43-44 :—

"The motion was brought before me on false representations, because the representation in the bill originally filed is —'The manufacture of such stout is based upon a particular method or process, whereby the earthy phosphates or nutritive salts of the malt, which afford mineral nourishment to the bones and nerves of the body, are more fully and completely extracted and developed than is ordinarily the case.'

"That is his deliberate statement, because he swears it also in his affidavit; but not only that, for he actually adheres to it at a later period, when he was cross-examined on the 5th December, 1871.

"He now abandons all that case, and admits that Truman, Hanbury, and Co. supply him from the same vats from which they supply all their other customers, and that the beer for him leaves the brewery precisely in the same condition as it leaves the brewery for somebody else. What is his case now? Why, that when he gets it to his cellars he doctors it himself —that is, he puts something into it which brings out these remarkable qualities; that it becomes more agreeable to the palate, more digestible, and more suited to invalids, and has all the qualities which he wants to take advantage of under the word '*nourishing.*'

"For the purpose of proving that he has brought forward half a dozen medical men who have given testimony that they have tasted the beer when first delivered to the plaintiff and after it has been doctored, and they would detect the difference merely by the taste, the defendants have called a Dr. Rogers, who says he *analysed* the beer, and could find no difference between the two; and as the brewing solely for him by Truman and Co., turns out to be a fiction, I am very much inclined to think that what he puts into the beer is also a fiction."

Bill dismissed with costs.

Dr. Hassall's report was, no doubt, a just and honest one. His name on the labels must have had and will have a material influence on the sale of this stout.

Was such a use of an eminent name fair to other traders, who, like Findlater and Co., were supplying the public with good stout also from the vats of Messrs. Truman, Hanbury, and Co.

Another instance may be given. A disinterested wine and spirit merchant *generously* distributes both in the metropols and in the provinces samples. And at the same time asks for an order and for a medical opinion.

The wine and spirit may be good, and the price may suit.

An order is given, with a letter approving of its quality and character.

The wine merchant, when he has secured a sufficient number of medical names on his books, issues a circular to the lay world, in which the names, addresses, and qualifications of his medical customers figure in large type, and often thereby secures patrons.

The individual opinion of a medical man who judges a wine and spirit purely by his own palate is not worth any more than that of a layman.

Our education does not necessarily fit us for the office of wine-tasters.

We are aware that we have in our ranks a large number of *connoisseurs*, but we have also a large number who believe in the efficacy of a claret at 12s., and of a sherry at 18s. per doz.

The public do not know this, and consequently a fictitious value is set upon a wine to which it is not fairly entitled, from the fact that it is known to be purchased by a number of medical men.

What remedy do we propose? We cannot, of course, prevent our *confreres* from expressing their opinion as to the merit of any article of food or wine, and we can only point out to the public the *fallacy* of valuing these opinions at anything more than they are worth.

With the analyst we have more difficulty in suggesting a remedy. His *rôle* is a very important one, when, if we are to believe our Laureate—

"Only the ledger lives, and when only
Not all men lie.
Peace in her vineyard! Yes!—
But a company forges the wine:
And the vitriol madness flushes up
In the ruffian's head,
Till the filthy by-lane rings to the
Yell of the trampled wife;
And chalk and alum and plaster
Are sold to the poor for bread,
And the spirit of murder works in
The very means of life."

By his skill adulterations have been exposed, and the public has been protected from unprincipled traders; and it is right and just that on occasions certificates should be given, but a limit should be put to their indiscriminate use.

No useful or beneficial purposes are served, legitimate trade is not benefited, when promoters of companies or individuals obtain the opinion of some eminent chemist and then flood the world with his report in praise of their compounds.

Our analysts will recognise the justice of our remarks, and take them in the spirit in which they are meant. We believe that as a body they are distinguished by the highest sense of honour and rectitude. Their own dignity will point out to them the necessity of issuing rules for the granting of certificates, and they will thus raise such certificates when given in the estimation of the public, and thus best consult their own interests and self-respect.

Yours faithfully,

Halifax. T. M. Dolan, L.R.C.P. Ed., F.R.C.S.

TWOPENNY MEDICINE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I have received, whilst acting as secretary of "*The Medical Press* Fund," numerous letters sympathising with the object in view, and in some of these communications cases of flagrant and unprofessional conduct have been stated to me.

I am informed that there are two licentiates of the Royal College of Physicians, London, who dispense medicine and prescribe for patients at the rate of twopence per patient. Of course a proceeding like this is derogatory to the College of Physicians, but I do not know under which of their bye-laws such practices can be interfered with. It is my intention, however, to inform the College of these proceedings, in order for it to take proper steps in that matter.

I am, Sir, your obedient servant,

L. S. Forbes Winslow.

23 Cavendish Square, Jan. 1, 1877.

THE BEATTY MEMORIAL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Dear Sir,—The columns of your journal, and those of similar professional character, being in my opinion the most fitting way of communicating the feeling here so kindly expressed, will you oblige me by giving insertion to the same.

I remain, very truly yours,

Jolliffe F. Tufnell, Hon. Sec.

101 Fayshill Terrace, Cheltenham,
Dec. 28, 1876.

Dear Mr. Tufnell,—On behalf of the members of the family of the late Dr. Thomas Edward Beatty, I write to express our deepest thanks for the compliment paid to his memory by the erection of the Tablet, which has recently been unveiled in St. Patrick's Cathedral, by the Right Hon. the Lord Mayor of Dublin, and we would ask you, as Hon. Secretary, to be pleased to communicate in whatever way you deem most appropriate, this our expression of gratitude to the members of his profession of their kind remembrance of him.

Believe me, dear Mr. Tufnell, faithfully yours,

William C. Beatty, M.D.

To Jolliffe Tufnell, Esq., Hon. Sec.,
58 Lower Mount Street, Dublin.

Medical News.

University of Dublin.—The following degrees were conferred on December 20:—

Bachelor in Surgery.—Joseph Marshall, James Alexander Nelis, William Joseph Pim, Edward Richard Power, John B. Story.

Bachelor in Medicine.—John St. George Browne, William Rogers Conolly, Henry Alexander Davison, John Wellesley Flood, William John Frazer, John Francis Houghton, Gilbert Lynch, Frederick Fitzgerald M'Cartie, Rudolph MacDermott, Jonathan Hill Malone, Joseph Marshall, James Alexander Nelis, William Joseph Pim, John Benjamin Story, James Edward Thompson.

Master in Surgery.—Dudley Loftus Fitzgerald, William Joseph Pim.

Doctor in Medicine.—William Thomas Greene, Henry Wedenham Maunsell.

Licentiate in Medicine.—Richard Henry D'Olier Duckworth.

The Mortality of Foreign Cities.—The annual rates of mortality, according to the most recent weekly official returns, were:—In Calcutta 37, Bombay 24, Madras 35, Paris 26, Brussels 24, Amsterdam 29, Rotterdam 26, The Hague 23, Copenhagen 22, Stockholm 23, Christiania 20, Berlin 26, Hamburg 26, Breslau 25, Munich 33, Vienna 25, Buda-Pesth 39, Rome 28, Naples 28, Turin 23, New York 20, and Brooklyn 18. The fatal cases of typhoid fever in Paris were 48, against 171, and 62 in the two preceding weeks. Typhus caused 18 deaths in Buda-Pesth.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

"MEDICAL DEFENCE FUND."

We are requested by the Honorary Treasurers to this Fund to acknowledge with thanks the receipt of the following additional subscriptions to this Fund:—

Sir Henry Thompson, Bart., London	2	2	0	Mr. Francis Mason, London	1	1	0

ON THE TREATMENT OF AMBLYOPIA.

By H. R. Swanzy, A.M., M.B., F.R.C.S.,

Surgeon to the National Eye and Ear Infirmary, Ophthalmic Surgeon to Steeven's Hospital.

The following are a few cases of amblyopia which have been treated by a new method—namely, by the Inhalation of Nitrite of Amyl.

Case I.—W. G——, a coastguard, æt. 39. On the 12th May last, and following fifteen days, he was employed in whitewashing the coastguard premises. The sun shone brightly on the wall he was working at, and before the first day was half over he perceived the sight of each eye to have become dim, and he complained of pain in the temples. Still he continued the whitewashing for a fortnight. During this time his sight did not get worse. On the contrary, the left eye recovered good vision, and he thought the right would also get well, but not finding it do so he applied to his medical officer on 5th June. By him he was placed on a mild course of mercury. A fortnight after this the sight of the left eye became dull again, and continued to get worse. The sight of the right eye had remained the same from the commencement. The patient was sent to the National Eye and Ear Infirmary, under my care, on the 12th July.

Upon examination, I found that with the right eye he could count fingers when held up at a distance of 4 ft. only. The opthalmoscope showed the vitreous humour of this eye to be filled with a diffuse opacity, rendering any view of the fundus oculi impossible. The vision of the left eye amounted to something between $\frac{1}{3}$ and $\frac{1}{4}$ (L. Sn. at 14′) of the normal standard. It could make out type No. 4½ of Snellen at 8 in. with difficulty. He complained a good deal of a broken, irregular appearance of the letters, and of temporal headache. The ophthalmoscopic appearances of the left eye were perfectly normal. My prognosis for the right eye was unfavourable, as opacities of the vitreous humour of this kind are but rarely amenable to treatment, and there was no doubt but that the greater part of the defect in vision in this eye was due to this opacity. For the left eye I held out hopes of being able to do something, basing my opinion on the healthy appearance of the optic nerve and internal coats. I then examined the field of vision of this eye by aid of Mr. Brudenell Carter's perimeter, using as a visual object a morsel of paper three lines square. The outer boundary (visual object white) was but little, if at all, contracted. The apparent contraction above and to the inside, and below and to the inside, is due to the patient's prominent brow and rather aquiline nose. The power of perception of colour, however, was confined to a very much smaller portion of the field than normally. If the perimeter be placed so that the fixation point (*a*) be removed 18 in. from the eye, the blue boundary, in the healthy eye, would reach to a distance of from 40° to 60° from the fixation point in every direction, and the red boundary would lie somewhat inside this, while the boundary for green would be found between 30° and 40° from the fixation point. In this case the furthest point of the blue boundary was at 40°, while at one place it was contracted to about 5°. The red boundary was also greatly contracted; but the most marked disturbance was in the power of perception of green, which was reduced to a very small district around the fixation point. Even within the boundaries indicated, the functions of the retina seemed easily wearied. Thus, if the white visual object were held motionless in one spot for a few moments it disappeared from view—the retina, in fact, became fatigued at the spot and ceased to act. The red or crimson object quickly lost its colour if held motionless within the red boundary, becoming of an indistinct dark shade. Blue became paler, approaching to white when held motionless.

As has been my usual practice in almost all cases of amblyopia, I commenced the treatment by an application of Heurteloup's artificial leech to the temples. However, not finding any benefit from it, I did not repeat it.

(*a*) In making perimetrical examinations, I am in the habit of examining from or towards the macula lutea, and not the blind spot.

On the 17th July I caused the patient to inhale ten drops of the nitrite of amyl from a small bit of cotton wool. Soon after he had quite recovered from its effects. I made him inhale ten drops more. Five minutes after the effect of the second inhalation had worn off I tested his vision, and found that a remarkable improvement had taken place for so short a space of time. He could now spell XL of Snellen at 14 ft.—that is to say, his vision had improved from $\frac{1}{35}$ to $\frac{1}{28}$ of the normal standard. He was also able to read No. 4½ with greater ease, remarking that the words seemed less confused than previously. Upon testing the patient's vision next day, I found that it had not relapsed, but that the improvement which had been effected continued. He then got ten drops to inhale. The peculiar symptoms produced by the inhalation continued about two minutes, and vision was not improved while they lasted. As they were just wearing off, vision was slightly dimmed; but this disappeared in three or four minutes. Ten drops more were then given and vigorously inhaled. About half a minute after the effect began the letters seemed double their real size, but still "in mist" and broken. Two hours later the vision for distance was found the same as after the inhalations on the first day; but near vision was further improved, so that he could read No. 3½ of Snellen at 8 in. slowly. On the 20th he was beginning to see XXX of Snellen at 14′. I gave him then three inhalations, and about three-quarters-of-an-hour afterwards he could spell XXX at 14′ almost perfectly (O S L *O* T *O*). No. 3 was read slowly at 8 in. On the 21st vision was no better, nor did two inhalations on that day effect any further improvement. On the 22nd vision still remained the same, but, after two inhalations, the sight became so improved that XXX could all be distinguished at 14′. He still complained of the haziness, although he said it was lighter. He said also he could only see the letter he looked at and the one next it, while the others were quite in mist. On the 23rd he got two inhalations. On the 24th vision was not any better, but after two inhalations he said he could make out XXX much more clearly. His vision now was very nearly half of the normal standard, and I did not succeed in producing any further improvement in it. I continued the inhalations of nitrite of amyl for a time, and tried some hypodermic injections of the nitrite of strychnia, but without avail. Before dismissing him from hospital (8th August) I again examined the field of vision with the perimeter, and found an improvement in the boundaries for red and blue, but very little in that for green.

On the 20th September he returned, complaining that about eight days previously the sight of the left eye had again become dim. He thought he had exposed himself too much to the bright glare of the sun. Bright light always gives him uneasiness and pain in the temples. I found his vision reduced as low as on the first day I saw him. After two days' treatment with the nitrite of amyl his sight was restored again as before. He was cautioned against exposure to strong lights in future.

Case II.—James O'H——, æt. 60, a nailer, was admitted to the National Eye and Ear Infirmary on the 19th May last. His sight had commenced to fail eighteen months before, but he had been able to work at his trade until within four months, when in the course of a week the sight became greatly worse, and continued so. For thirteen weeks prior to this rapid deterioration in his sight he had been drinking "weighty," as he himself expressed it, rarely taking his clothes off. During this time also he smoked an ounce of twist tobacco in the day. His habit for the last seven years had been to drink and smoke a great deal. The opthalmoscope displayed a loss of the natural pink hue of the optic discs, and in its place a dirty white discolouration. The central artery of the retina was not altered, and the central vein was also normal. With each eye the patient could count fingers at 6 ft. only, and (+ 14) could read but a few letters of No. 12 at 8 in. An examination of the fields of vision showed the outer boundary in each eye to be normal. The power of perception of red was not materially affected; but the powers of perception of blue and green were wholly wanting. In consequence of the questionable appearance of the optic nerves and the defect in the power of perception of colours, I did not hope to effect any great improvement in his vision. However, in this prognosis, I am happy to say, I was mistaken.

On the supposition that in cases of this kind the disease consists in a defective nutrition of the nerve substance, I had determined to try the effect of a nerve tonic in the form of phosphorus when the next opportunity might arise. Accordingly, after the artificial leech had been applied to each temple without benefit, I placed the patient on Kirby's pil. phosphor., containing 1-33rd grain of phosphorous in each, one three times a day at meals. I need hardly say that all smoking and drinking was strictly forbidden, and I believe the patient attended to my directions in these respects. The phosphorus treatment was commenced on 29th May. I need not weary the Society with a diary of the case; suffice it to say that on the 1st of July the vision of the right eye had improved almost to C of Snellen at 14′, and that of the left eye to C C at 14′, while with each eye (+ 14) some words of No. 5½ Snellen could be read at 8 in. The field of vision also had improved, inasmuch as blue could now be well distinguished as far as its normal boundaries; but green could not yet be seen. On the whole, the result of the phosphorus treatment in this case must be regarded as very satisfactory when the serious nature of the case is remembered. I consider the method well worthy of an extensive trial in similar cases. I cannot find that any late writer has recorded cases treated in this way; but it seems from Dr. Ashburton Thompson's book (*a*) (p. 158) that, about twenty years ago, Löbel treated some cases of glaucoma (?) with phorphorus successfully, while Gosselin and Maisoneuve record some negative observations.

Having experienced the beneficial results of the nitrite of amyl treatment in the first case, I determined to give it a trial in this one also, and on the 24th July I gave the patient ten drops to inhale. Fifteen minutes later the vision of the right eye was improved, so that he could almost see C of Snellen at 14′—that is to say, his vision in this eye was improved from about 1-14th to nearly 1-7th of the normal standard. The left eye had not improved. He then got ten drops more, and an hour later the vision of the left eye had increased to Snellen C at 14′.

July 25.—Vision as yesterday. Two inhalations. Half-hour later no further improvement.

July 26.—*Oc. Sin.* No improvement. Reads No. 5½ words, with+14. *Oc. Dex.* Vision $\frac{14}{C.}$ (+14) No. 6½ (words) at 8″. Two inhalations. Half-hour later no further improvement.

July 27.—*Oc. Sin.* Seems to be beginning to see LXX. at 14′. Can say that the first letter is D. *Oc. Dex.* Unimproved since yesterday. One inhalation. After half-hour, *Oc. Sin.* $\frac{14}{D?N}$. *Oc. Dex.* $\frac{14}{C.}$ Second inhalation. Afterwards, *Oc. Sin.* $\frac{14}{LXX.}$ *Oc. Dex.* $\frac{14}{LXX?}$ (DL?).

July 30.—Two inhalations. Vision unaltered.

July 31.—Vision unaltered.

August 1.—*Oc. Sin.* Stat. id. *Oc. Dex.* $\frac{14}{LXX.}$

August 2.—*Oc. Utr.* $\frac{14}{LXX.}$ rather clearer with *Oc. Sin.* than *Oc. Dex.*

August 3.—*Oc. Utr.* No alteration. After three inhalations no further improvement. No further improvement in vision was noted until the 12th August, the inhalations having been continued daily, with the exception of two days.

August 12.—*Oc. Sin.* $\frac{14}{L?}$ (?? BR). *Oc. Dex.* $\frac{14}{LXX.}$ Three inhalations.

August 15.—*Oc Utr* $\frac{14}{L[?]}$ (?? SR). Three inhalations.

August 17.— *Oc. Utr.* as on 15th instant. Three inhalations.

(*a*) "Free Phosphorus in Medicine." 1874.

August 18.—*Oc. Utr.* Vision stat. id. Three inhalations.

August 19.—*Oc. Sin.* $\frac{14}{L[?]}$ (*?* SR). *Oc. Dex.* $\frac{14}{L[?]}$ (*?* TSR). One inhalation.

August 21.—*Oc. Utr.* as on 19th inst. *Oc. Utr.* (+14). No. 5½ (words). Treatment continued daily without further improvement until

August 30.—*Oc. Sin.* $\frac{14}{L[?]}$ (?+SR) *Oc. Dex.* $\frac{14}{L}$. Three inhalations.

Sept. 1.—*Oc. Utr.* $\frac{14}{L}$. With both eyes open. Vision $\frac{14}{XL}$ (+12) No. 5½ at 8". The treatment was continued for some days longer, but no further improvement effected. The improvement effected by the nitrite of amyl treatment in the course of six weeks was such that the patient could at the end of this time see four times as well as at the beginning. Before dismissing him from hospital, I again examined his field of vision, and found that the power of perception of green had returned, and occupied a normal extent of the field.

CASE III.—Patrick C——, æt. 38, a shoemaker, applied at the National Eye and Ear Infirmary, on 17th of July last, complaining of failing vision. He had been for many years a great smoker, and habitually drank very much.

With the right eye (Em.) he could see Snellen L at 14' with some difficulty. The vision of this eye was therefore about one-third of the normal standard. He could read with the same eye (+20) No. 2½ Sn. at 8" with difficulty. He was not a good reader.

With the left eye (HM $\frac{1}{20}$) he could barely see Sn. C. at 14', an amount of vision equal to less than one seventh of the normal, and could read Sn. 5½ (+20) at 8".

The optic nerve seemed to be slightly whiter than normal. The corneæ presented signs of keratitides in childhood, in the form of small facets. An examination of the fields of vision did not discover any abnormality.

On 28th July he got ten drops of nitrate of amyl to inhale. Ten minutes later the sight of the left eye had improved almost to Sn, L. at 14'—that is to say, its vision was just twice as good as before the inhalation. The right eye had not improved. He then got ten drops more to inhale. After thirty minutes the left eye could make some attempt at XL., while the right eye could see L. more distinctly than before. The vision of each eye went on improving by degrees under the treatment until the 8th August. It then had reached in the right eye almost to ½ (XXX (*?*) at 14'), and in the left to more than ⅓ (XL. at 14') of the normal amount. No further improvement could be effected. Probably perfect vision would have been restored had it not been for the irregularities on the corneæ.

The only disagreeable consequence which I saw result from the inhalations of the nitrite of amyl were in this case. While the immediate effect of the inhalation lasted, the Schneiderian mucous membrane secreted copiously, and there was an abundant flow of tears, and after a few days the inside of the nose became very sore.

CASE IV.—William F——, æt. 40, a messenger, applied at the National Eye and Ear Infirmary on the 24th July last. He said he had enjoyed very good sight until a week before, when it rapidly became obscure. He had always been in the habit of drinking three or four bottles of ale in the course of the day, and three or four glasses of whisky in the evening, and of smoking half an ounce of twist tobacco every evening.

The vision of the right eye (E) was about $\frac{1}{7\cdot1}$ ($\frac{14}{C[?]}$) of the normal standard, and it could read (+ 20) No. 12½) at 8 inches slowly.

The vision of the left eye (E) was $\frac{1}{2\cdot8}$ ($\frac{14}{XL}$) of the normal standard, and it could read (+ 20) No. 3 with difficulty at 8 inches.

An examination of the fields of vision showed that in the right eye the outer boundary was normal, as also the blue boundary, while the field for red was somewhat contracted, and the power of perception of green was entirely wanting. In addition, there was a central scotoma for red, a region just at the point of fixation, in which the power of perception of red was absent. When a bit of blue paper 2½ lines square was held at the point of fixation it seemed to the patient brown in the centre, while around the edges it was blue—in short a very small central scotoma for blue was also present. Yellow was seen as red in every part of the field except at the point of fixation, where it seemed brown.

In the field of vision of the left eye the outer boundary, as well as the red and blue boundaries, and the boundary for yellow, occupied normal positions, but, as in the right eye, green of every shade seemed to be brown in all parts of the field. There was no central scotoma in this eye.

The ophthalmoscope displayed no well marked disease, but some slight paleness of the optic discs may have been present.

The patient was advised to abstain from all smoking and drinking, and on the 3rd August I gave him two inhalations of nitrite of amyl closely following each other. Upon testing his vision afterwards I found that with the left eye he could see Snellen XXX almost perfectly (GBLCTG) at 14 feet, being an improvement of from $\frac{1}{2\cdot8}$ to $\frac{1}{2\cdot1}$ ($\frac{1}{XXX}$) in the course of a few minutes. The improvement in this eye continued advancing until the 19th August, when he could see with it XX Sn. almost perfectly at 14 feet (v $\frac{1}{1\cdot4}$). The right eye did not improve during the whole course of the treatment. He now remained absent until the 25th August, and in the meantime had, I suspect, returned to his old, bad habits. On examining him on that day I found that some relapse had taken place in the left eye, its vision being but $\frac{1}{2\cdot1}$. He then attended for a few days, and again remained away, so that no further improvement was produced by the treatment. I regret to say the patient did not give me an opportunity of examining his field of vision at the conclusion of the treatment. I saw him two months afterwards, and found that the vision of the left eye had fallen back somewhat, but I have no doubt that he had not maintained those temperate habits which I recommended to him as necessary for the preservation of his sight.

Besides the foregoing, I have tried this method of treatment in one case of advanced atrophy of the optic nerve, and in two cases of neuro-retinitis, but without any beneficial result.

The only published case of amaurosis, or amblyopia, treated by the nitrite of amyl of which I am aware occurs in the number of the *Berliner Klinische Wochenschrift* for 24th April last. It is by Dr. Steinheim, of Bielefeld, and it suggested the trial of the drug to me in the above cases. Dr. Steinheim's patient was a married woman, who completely lost the sight of both eyes after a severe uterine hæmorrhage. The ophthalmoscope displayed a greyish-white opacity of the optic papillæ, which latter were somewhat swollen and with indistinct margins. On the sixth or seventh day after the blindness came on, Dr. Steinheim admitted the patient into his hospital, and gave her eight drops of the nitrite of amyl to inhale. As soon as the effects had passed off, he gave her a second similar inhalation. About fifteen minutes later sight began to return to the left eye, so that fingers could be counted at a distance of 4 or 5 ft. The right eye still remained blind. The patient was kept in a dark ward, and received good diet and wine. Nitrite of amyl inhalations were given several times a day. On the 30th May the patient could count fingers at 14 ft. with the left eye, although only with the upper part of the field of vision. The lower part of the field did not recover its functions, nor did any part of the retina of the right eye. The appearance of the optic discs had altered to that of atrophy. Dr. Steinheim says he has had very satisfactory results from the treatment in other cases, which he proposes to make known at a later period.

I shall not venture to draw any definite conclusions from the cases I have narrated as to the precise indications for

the employment of nitrite of amyl in amblyopia. We must wait for wider experience to establish these. It is evident, however, that there are some cases at least in which the treatment has a remarkable effect, and my object has been to draw attention to this fact, so that others may be induced to try the method.

As to the *modus operandi* of the treatment, I have been unable to do more than form a conjecture. The physiological effect of an inhalation of nitrite of amyl is to paralyse the vaso-motor nerves of the head and neck (*a*). I am inclined to think it is the increased supply of blood to the impoverished nerve centres, caused by the dilatation of the capillaries, that is the immediate cause of the improvement in vision.

I may here remark that in none of my cases did the ophthalmoscope show any alteration in the calibre of the retinal vessels while the primary effects of an inhalation lasted. This coincides with the observations of Steinheim and of Sämisch and Stammeshaus (*b*), but is at variance with those of Aldridge (*c*).

None of the authorities whom I have been able to consult record any dangerous effects from the use of this drug. Wood, an American practitioner, says (*d*) the pulse should be carefully attended to, as there is danger of paralysis of the heart with too large doses. This danger, he says, never comes on suddenly, but gives warning long before by the nature of the pulse. He does not seem to have seen any fatal case. With such doses as I gave in the cases I have narrated I would not fear paralysis of the heart; but if I were suspicious of atheroma of the arterial coats, I would not give nitrite of amyl inhalations.

The following list of authors who have directed attention to the use of nitrite of amyl and its physiological action, although incomplete, may be of some interest to the reader:—

C. Höstermann. "Ueber die Anvendung des Amylnitrits bei Melancholie."—*Wien. Med. Wochenschr.*, Nos. 46, 47, 48, 1872; *Centralblatt*, No. 10, 1873.

Found it most useful in melancholy madness, contributing materially to the permanent cure. Four or five drops every fourth hour.

Rob. Pick. "Ueber das Amylnitrit und peine therapeuthische Anvendung."—*Centralblatt*, No. 55, 1873.

Neither headache nor unconsciousness was produced even by the largest doses, the effect passing off rapidly without leaving any disagreeable results. P. has proved experimentally that the nitrite of amyl is a direct muscle-poison. He considers it a most useful agent in hermicrania angiospastica. It was most efficacious in a case of cardial neuralgia, and in several cases of epilepsy and asthma, and it had a temporary effect in a case of traumatic tetanus.

H. C. Wood, Jr. "On the Therapeutic Value of Nitrite of Amyl."—*Amer. Journ. Med. Sc.*, 1871, p. 359-362; *Centralblatt*, 1872, No. 14.

One case of tetanus successfully treated with the nitrite of amyl alone, and another case with similar result where it was used in combination with hydrate of chloral. Says its usefulness in angina pectoris, with or without organic disease of the heart, cannot be doubted. He describes a case where angina pectoris occurred in conjunction with mitral valve disease. The inhalation of five drops rapidly arrested each attack; and the attacks then appeared more rarely, until at last they ceased altogether. Thinks the pulse should be carefully attended to, as there is danger of paralysis of the heart with too large doses. This danger never comes on suddenly, but gives warning long before by the nature of the pulse. He does not seem to have seen any fatal case.

S. Weir Mitchell. "Nitrite of Amyl in Epilepsy."—*Phil. Med. Times*, 1872, No. 38; *Centralblatt*, 1872, No. 23.

Was able in two cases to prevent the occurrence of the attack by administering nitrite of amyl as soon as the premonitory symptoms appeared.

W. E. Jenks. "Case of Puerperal Eclampsia treated with the Nitrite of Amyl." *Phil. Med. Times*, 1872, No. 45.

Found it of great benefit in a case of severe puerperal eclampsia. The attacks were cut short, and soon ceased altogether.

J. Crichton Browne. "Nitrite of Amyl in Epilepsy."—*West Riding Lun. Asyl. Reps.*, III., 1873, 53-174.

An inhalation either prevented the occurrence or diminished the severity of the fits.

Schueller. "Ueber die Einwirkung Einiger Arzneimittel auf die Gehirngefässe."—*Berl. Klin. Wochen.*, 1874, Nos. 25 and 26.

S. observed a distinct dilatation of the arteries and veins of the pia mater. A dilatation of the vessels occurred even on the side upon which the vessels were already dilated, owing to an injury to the sympathetic, and it took place both after division of the pneumogastric and in curarised animals. The author thinks the effect depends on the degree of filling of the vessels, and upon the power of reaction of their middle coat.

A. Ladendorf. "Ueber das Verhalten der Kopftemperatur bei Amylnitritinhalationen."—*Berl. Klin. Woch.* 1874, No. 43.

The temperature in mouth and armpits rises considerably, and does not generally fall to its previous level for two hours.

M. Putnam Jacobi. "Nitrite of Amyl and Belladonna in Dysmenorrhœa."—*Med. Record*, Jan. 2, 1875; *Centralblatt*, No. 34, 1875.

Two or three drops of nitrite of amyl to be inhaled if a previous treatment with belladonna has not prevented the occurrence of dysmenorrhœa.

T. Jones. "Suggestions for the Employment of Nitrite of Amyl in the Collapse and Cramp of Cholera."—*Brit. Med. Journ.*, 1871.

On the supposition that the cholera poison produces a contraction of the small arteries, and hence the stadium algidum and the muscular cramps, the author proposes to employ nitrite of amyl in this disease.

T. Lauder Brunton. "Ueber die Wirkung des Salpetrigsauren Amyloxyd auf den Blutstrom."—*Arbeiten aus d. Physiol. Anstalt zu Leipzig*, 1869, 101-120.

The blood pressure in the vessels sinks, owing solely to the dilatation of the vessels.

O. Berger. "Zur physiologischen und therapeutischen Würdigung des Amylnitrits."—*Allg. Med. Centralzeitung*, 1874, No. 94.

B. shows by experiments on animals that the diminished blood pressure may be produced by nitrite of amyl independently of the vaso-motor centres in the medulla oblongata. He says the drug is of use in the angiospastic form of hemicrania only, and not in all cases. It may be effective in those fits of epilepsy with vaso-motor aura, but has no influence over the disease itself. Found of use in some cases of angina pectoris, in others not. It is of no use, according to the author, in attacks of bronchial asthma, in hysterical convulsions, or in tetanus. He twice found it have a beneficial effect in severe fainting fits.

C. Bader. "The Dangers of Chloroform, &c., and the Nitrite of Amyl."—*The Lancet*, 1875, No. 19.

(*a*) Bernheim (*Pflüger's Archive*, VIII., 253-259, 1873), and Eulenburg and Guttman (*Reichart and Du Bois' Archive*, 1873, 620-625) find that nitrite of amyl paralyses the vaso-motor centres, while Pick's experiments tend to prove it to be a muscle poison (*Deutsch Archiv. f. Klin. Med.*, XVII., p. 129).

(*b*) *Centralblatt f. d. Med. Wissench*, No. 55. 1873.

(*c*) "The Ophthalmoscope in Mental and Cerebral Diseases." *West Riding Lunatic Asylum Reports*, Vol. I. 1871.

(*d*) *Amer. Journ. Med. Sc.*, 1871, p. 359.

B. recommends nitrite of amyl as an antidote where threatening signs make their appearance during a chloroform narcosis, and communicates three clinical observations in illustration.

S. Mayer and J. Frederich. "Ueber einige physiologische Wirkungen des Amylnitrits."—*Archiv. für Exper. Pathol.*, V., p. 55; *Centralblatt*, No. 38, 1876.

Experiments on animals. The frequency of the pulse is increased in consequence of a depression in the tone of the pneumogastric centres. The drug acts directly on the walls of the vessels. After moderate doses the respiration becomes deeper, and more frequent, but after large doses shallow, and very slow.

Kelp. "Amylnitrit."—*Deutsch. Archiv. f. Klin. Med.*, XV., p. 602; *Centralblatt*, No. 10, 1876.

In five cases of melancholia stupida the author had negative results from the use of nitrite of amyl.

Clapham. "Nitrite of Amyl in Sea-sickness."—*Lancet*, No. 8, 1875.

Out of 124 cases, 121 were completely relieved.

Clinical Records.

ON AN INTERESTING CASE OF MOVABLE LIVER.

At a scientific meeting of the medical officers of the garrison at Vienna, which was held not long ago, under the presidency of Regimental-Surgeon Dr. Sidlo, a very interesting communication was read by Regimental-Surgeon Prof. Chvostek, on a case of movable liver (*wandernde Leber*).

The reader of the paper (which is published in the *Allgemeine Wiener Medizinische Zeitung* of 23rd Nov.) has had the opportunity of discovering, in a woman of fifty-three years of age, this rare phenemenon, which has not been observed in Vienna before, of which only seven cases are recorded in medical literature, and which is not even mentioned in our current text-books of medicine.

From the history of the case we learn that the patient had been married eighteen years, and had given birth to twelve children, nine of whom were still living. After each delivery the lochial discharge continued for six or eight weeks, the abdominal walls were much relaxed, and the bowels very constipated. In 1869 cramps came on, and after (in 1870) lasting for three months in an aggravated form, completely disappeared until, in 1874, they again returned. In February, 1875, medical advice was resorted to. Colicky pains were then complained of, which, proceeding from the neighbourhood of the stomach, became particularly severe around the region of the navel. They lasted for an hour every day, were not alleviated by morphia, prussic acid, &c., and so completely deprived the patient of her sleep and appetite that—in the latter part of the summer—she was, in consequence of her weak state, obliged to keep to her bed. Her medical adviser administered narcotics and laxatives; and by this means, and through the removal of a large quantity of fæcal accumulation, relief was at last obtained. At another time there was vomiting of a dark-coloured fluid, which (in connection with the cachexia present, and the existence of slight jaundice, and a hard abdominal tumour) led to the supposition that it was a case of carcinoma of the liver. The abdominal walls were everywhere relaxed, and covered with large meandering veins; whilst strong peristaltic movements of the bowels could be also observed, especially during the attacks of colic.

On examination of the tumour by Professor Chvostek, a distinct notch could be felt beneath its lower border and above Poupart's ligament. On the other hand, percussion of the natural region of the liver gave a perfectly clear sound; and this clear sound, be it particularly observed, was not only evident in front, but behind also. The spleen was in its proper position, and of normal size; and there was no displacement of any of the other viscera. The tumour was freely movable—it settled down in the upright posture of the patient; but by elevating the pelvis, it could (although not without giving much pain) be replaced in its normal situation, when the dulness or percussion natural to the region of the liver at once returned.

The symptoms that have been described by authors (Cantani, Meissner, Winkler, Vogelsang, &c.) were always the same. The liver sunk down as far as the symphysis pubis. Here a tumour was perceptible. The symptoms were slight, and only amounted to a feeling of pressure and fulness in the abdomen. Winkler alone observed colicky pains, resembling those which arise from the passage of gall-stones; and the liver itself was always free from pain. In our case there were—as we have mentioned—severe pains, which returned every day, and which assumed two different forms. At one time there was a feeling as if there was at the navel a heavy weight, suspended from the sternum by means of a cord; on other occasions the pains were of a colicky nature. The liver was also very sensitive, a circumstance which always made its reduction difficult. The increased peristaltic action of the intestines was attributed by Chvostek to their being squeezed, as it were, by the liver, to distension of the abdominal blood-vessels, and to impeded circulation through the portal and hepatic veins. The pains arose from the same cause, or from slight peritonitis or hyperæmia. Similar pains have been complained of in the case of movable kidney, or movable spleen. Moreover, it is probable that the bowels were much pressed upon, and rendered immovable; and consequently, in order to overcome the pressure, violent peristaltic action was set up, accompanied by pain and various twisting movements.

We know very little about the etiology of this affection. But the author of the paper thinks the view taken by Meissner a very plausible one—namely, that as pendulous belly, pregnancy, &c., are of frequent occurrence, while this dislocation of the liver, on the contrary, very seldom happens, such dislocation may arise from a congenital laxity of the suspensory and coronary ligaments, which give way, and so allow the liver to fall out of its natural position. The relaxed state of the abdominal walls, arising from repeated pregnancies, also contribute to, or aggravate, the evil; for five of the eight cases occurred in women who were all more than fifty years of age.

The *treatment* of this dislocation is obviously to replace the liver in its natural position, and to endeavour to keep it there. Elastic bands or rollers are not suitable for the purpose, while a compress applied beneath the liver cannot be borne by the patient. Professor Chvostek, therefore, thinks that we should in such cases contrive a bandage for the middle and lower part of the abdomen, by which the upper part of that region would not be too much constricted, and the consistence of which should be nearly equal to that of a truss.

The discussion to which the above paper gave rise was short and uninteresting. With respect, however, to the etiology of the dislocation, the chairman of the meeting (Dr. Sidlo) remarked that the liver was not properly kept in its position by the suspensory ligament, but by its air-proof confinement (luftdichten verschluss); and that the liver is pushed down by diseases or accidents which, like perforating peritonitis and severe wounds, do away with that vacuum.

This opinion, we find, receives some support from the writings of Frerich's; for, according to that author, "the *ligamentum pensorium hepatis* restricts the movement of the liver only in cases of enlargement. As Hyrte justly remarks, this is not to be regarded as the true supporter of the liver." (*Clin. Treat. &c., Syden. Soc. Trans.*, vol. i. p. 45.) But with all due deference to the teachings of

these eminent authorities, we cannot help remarking that both the anatomical connections of the liver and the analogy of other parts of the body show that the *suspensory ligament* has, as its name implies, a great deal to do in maintaining that organ in its proper place. The liver is in some measure kept *in situ* by its connections with, and the slight support it receives from, the other abdominal viscera, by the abdominal muscles, and even by atmospheric pressure; but chiefly, we contend, by the suspensory and coronary ligaments. If these ligaments, especially the former, have little to do with restricting the movements of the liver, of what use are they? It does not seem to us at all logical to suppose, with Frerichs, Hyrte, and others, that these structures should be operative only when the liver is enlarged, and consequently heavier than usual, and inoperative when that organ is in its normal state. Such might be the case if the liver was naturally of light weight, as the bladder and uterus are—organs likewise supplied by suspensory ligaments. But here we not only have an organ weighing between three and four pounds, but we find its ligaments placed in just that position which must, in the upright posture of the body, give them the greatest purchase. The liver is naturally heavy, its thickest and heaviest part lies posteriorly, and its tendency to fall is from above downwards. Consequently, we find its strongest support placed chiefly between its upper surface and the diaphragm above it, while the coronary ligament lays hold of its thick, heavy posterior portion. We are, therefore, much disposed to think—with Meissner and the author of this paper—that these rare cases of movable liver are to a great extent due to a congenital laxity of these ligaments, favoured also by great relaxation of the abdominal walls.

With respect to the rarity of this visceral dislocation there can be no difference of opinion, and some may even doubt whether it has ever occurred. We have not had time to hunt up the literature of the subject, but it is certainly not mentioned in our ordinary medical textbooks, nor in any of the treatises on diseases of the liver to which we have had the opportunity of referring. It is not mentioned in Copland's "Dictionary of Medicine." Rokitansky has, in his great work, a section on "abnormities of position" of the liver, but makes no reference to it. Bright—in his admirable monograph on "Abdominal Tumours"—merely remarks that the liver is liable to displacement "from occasional, though not very frequent, deviations from its natural position:" and Frerichs, when treating of the malpositions and dislocation of the liver, only notices those which arise from tight-lacing, and from those diseases of the chest or abdomen which we all know to be influential in causing more or less displacement of that organ.

Transactions of Societies.

SURGICAL SOCIETY OF IRELAND.

FRIDAY, DEC. 8, 1877.

Mr. SWANZY read a communication on

SOME CASES OF AMBLYOPIA,

which will be found on page 17.

Dr. F. T. PORTER asked Mr. Swanzy whether he had any experience in the use of strychnia in these cases?

Mr. TUFNELL asked whether Mr. Swanzy had any experience of colour-blindness by night, which appeared to him to be a matter of importance at present, especially in connection with the subject of the pace at which steamships travelled at night, and the red and green lights carried by such vessels. He mentioned the matter because, Mr. Caldwell, one of the old licentiates of the Irish College of Surgeons, and surgeon to the steam-ship *Russia*—the ship in which he (Mr. Tufnell) came home—was bringing out a paper on the subject, and was in communication with his owners, the Messrs. M'Ivor, with regard to it. Mr. Caldwell's experience was that there were many men who were not able at night to distinguish between any two coloured lights, and when they considered that these ships went at the rate of twelve miles an hour, and therefore how very short a time could be had, in the event of the danger of a collision (which was certain to take place in case of the officer or look out not being able to distinguish between the colours of the lights) the subject was one of considerable importance: the same observations applied of course to railway signals. Another point that Mr. Caldwell had drawn his attention to was that the green and red glass used for these signal lamps was not of uniform colour—that they had a green glass almost black, and a red glass almost black, and a green or red glass hardly tinted at all. Mr. Caldwell's opinion was that the manufacture of these glasses should be under Government control, or under some regulation that they should be of uniform tint. He (Mr. Tufnell) did not know whether the subject had been brought before Mr. Swanzy or not, but it was a matter of great importance to the public—colour-blindness at night.

Dr. HENRY KENNEDY observed that the effects of the use of tobacco had been alluded to in nearly every case described by Dr. Swanzy in his paper. But a few years had elapsed since a wonderful discussion took place, occupying many pages of the *Lancet*, on the question of the effects of tobacco, and the divergence of opinion at that time was most extraordinary. He thought that of late years the effects of tobacco were beginning to be more appreciated, and it was generally understood, he thought, that smoking to excess did lead directly to disease—he spoke, of course, of disease of the eye, at present. The impression of some was, that it was more the lens that was affected than the retina; and he would be glad to hear what was the result of Mr. Swanzy's observation on the point, for it was one of considerable importance indeed. He wished to know, also, whether the nitrite amnii, as given in the cases detailed by Mr. Swanzy, produced complete anæsthesia, and what was the effect of the ten drops, as used by him.

Mr. SWANZY, in reply, said with regard to Dr. Porter's query, that he had often tried strychnia in such cases as these, and such cases as these were just the kind that strychnia was good for, if it was good for any cases; but he did not think that strychnia was holding its own in ophthalmic practice. For his own part, although he had had some fair results from its use, he had had no very brilliant ones; and he had also had cases in which he thought the effect was not of much consequence at all. In reference to Mr. Tufnell's observations, he (Mr. Swanzy) had no experience of colour-blindness in the way referred to at all. But he knew this much, that in France and also in Germany—but to a great extent in France—great care was taken in the choice of railway officials in this respect, and the physicians appointed by the railway companies in France examined the porters and guards, and so on, with much care as to this point, and out of thousands they examined, they had to reject a considerable percentage on account of colour-blindness. With regard to colour-blindness at night and colour-blindness by day, he was not so sure that there was a great difference between day and night. He suspected that if a person was colour-blind by day, he would be colour-blind by night; and if not by day, that he would not be colour-blind at night. There were so many different kinds of colour-blindness, that it would be an endless matter to go into them in detail. Some persons were blind for one colour, and others blind for another. Of course it was very important to find out which colour, and the examination, he thought, should be always very carefully conducted. As to the use of tobacco adverted to by Dr. Kennedy, he (Mr. Swanzy) thought tobacco amaurosis was a very common disease. They did not often find it, simply because it was often combined with amblyopia—the result of drinking too much whisky. But he had seen cases of pure and simple tobacco amblyopia, and every person practising as an oculist must have seen such cases. There was no doubt that it was an affection of the retina or optic nerve, or nerve centres, wherever they were. The question as to what kind of smoking was most injurious, and how much one might smoke without harm was a very important one; and his idea was this,—that the most injurious smoking-material was that most common in this country—namely, the common Limerick twist tobacco. That was the very worst kind of tobacco that could be imagined, and to make it worse, people smoke it in short clay pipes, very dirty, and the longer they had those pipes the better they liked them. The kind of smoking that was in his opinion the least injurious—but he had no statistics on the subject—was light dry cigars, and if one got a few light dry cigars, and smoked them in the

course of the day, they would not be productive of harm. He believed they could get nitrite amnii to produce anæsthesia, but to do that they would have to administer a good deal of it; but he thought they would run risks if they endeavoured to produce anæsthesia by it. Ten drops would not do it—that was a very small dose. After all, they could not gauge the amount they actually gave the patient, if they administered ten drops by inhalation. A person would have to inhale it very strongly in order to get the full benefit of the ten drops; and if the inhalation was weak, the patient only got a weak dose. That all depended on the vigour with which a man sniffed it up his nostrils. He had had to stop some people, who thought that the more strongly they inhaled it, the more good they would do themselves.

Literature.

THE PRACTITIONER'S HANDBOOK OF TREATMENT. (a)

It is with no little pleasure that we welcome a book which is devoted exclusively to the treatment of disease. The medical era in which we now live is by no means remarkable for our attention to therapeutics. There was a time when therapeutics was an important object of consideration both by medical writers and medical practitioners. But then there was unbounded faith in the efficacy of drugs. Pathology was comparatively in its infancy. Hygiene was a term scarcely ever mentioned, or sounded strangely in the ears of those who were entirely engrossed in the treatment of disease, but who cared little for its prevention. All this is now changed. Old and long-cherished doctrines have an interest that is purely historical. The old faith in the virtues of many medicines and of heroic systems of treatment has received many a rude shock from modern scepticism, from the advancement of medical knowledge, from the intrusion upon the mind of other and more attractive subjects, and perhaps from the mere force of that reaction of fashion which is so inseparable from the opinions and practices of mankind. Hence the practical treatment of disease has been sadly at a discount within the last few years, as our treatises on practical medicine and the practice of both private and public practitioners very plainly show, and hence the busy workers in the field of medical literature and science turn away from the doubtful and uncertain province of therapeutical research to the more interesting and tempting study of pathology, or the more fertile and fruitful sphere of public hygiene. We are therefore glad that we can speak in favourable terms of this work, as such works give promise that we have not quite given up that therapeutical zeal which characterised the times of Cullen or of Graves, and which, if tempered by modern experience and by an enlightened rationalism, will equally redound to the interests of our patients and the advancement of medical science.

At the outset we may say that Dr. Fothergill's work is eminently practical. Its style may now and then be considered gossipy, and here and there the subject is treated in too discursive a manner, but nevertheless it is a work which is full of valuable hints, and one from which the practitioner cannot fail to derive great assistance in the difficult task of successfully grappling with disease.

The object of the work is to explain the *rationale* of our therapeutic measures. First, the physiology of each subject is given, then the pathology is reviewed so far as they bear upon the treatment; next the action of remedies is examined, and afterwards their practical application in concrete prescriptions is fully and yet concisely discussed. The design of the author has been to furnish to the practitioner "reasons for the faith that is in him, and a work on medical tactics for the bedside rather than the examination table." Nor can we say that the execution of his task has fallen far short of his design. The five or six hundred pages which this book contains are divided into twenty-four chapters, any one of which can be taken up with pleasure and profit to the reader. The first few chapters treat of such important subjects as those of "Assimilation," "Excretion," "Body Heat and Fever," "Inflammations," "Blood Poison," "Acute and Chronic Disease," "Diatheses," &c., while the rest are chiefly devoted to the physiology and therapeutics of the diseases of the circulation, "The Respiratory System," "The Reproductive System," "The Lymphatic System," "Public and Private Hygiene," "Dietetics," &c. We miss, however, a chapter on functional derangements of the liver. Considering what an important part this organ plays in the economy, both in health and disease, we hope that the author will in the next edition of his valuable work devote a few pages to the affections above mentioned.

The value of a handbook of treatment will also much depend upon the principles which have guided the author in laying down plans and rules for the assistance of the reader, and we are glad to see that his principles are good and his treatment judicious. With respect to the therapeutic efficacy of medicinal and other agents, Dr. Fothergill is neither over-sceptical nor over-confident. His treatment is neither perturbative nor expectant, but is founded upon a due and rational estimate of the action and uses of drugs, and of the pathology of the symptoms for which they are prescribed. Thus, in the treatment of the more acute forms of inflammation, the author has no objection to moderate local depletions, a full dose of calomel, opium, and antimony at bedtime, followed by an aperient draught in the morning, and a saline antimonial mixture during the day—these, however, soon to be replaced by mineral acids and vegetable tonics, quinine, nutritious food, &c. Again, in discriminating between the respective uses of opium and chloral, the author says:—"Chloral hydrate is a drug which stands second to opium only as an agent which depresses nervous action. There are differences, however, betwixt the actions of these two agents which are far from unimportant. We have just seen that for the production of sleep two factors are necessary—viz., cerebral anæmia and a quiescent state of the cerebral cells. Opium acts more pronouncedly upon the cells than the circulation, whilst the effects of choral are most markedly felt by the circulation, and to a less extent by the cells. Thus in old days a depressant, as tartar emetic, was combined with opium in conditions of sleeplessness due to vascular excitement. In such conditions chloral is the hypnotic *par excellence*. . . Where vascular pain and excitement co-exist, then chloral and opium should be combined. . . . It also acts upon the cerebrum and the centres at the base of the brain, whilst it has a decided effect upon reflex irritability. From its double effects upon the nervous system directly and upon the circulation, chloral has been found very useful in the treatment of mania—much more useful than opium. Chloral, too, is an excellent remedy in cases of cerebral irritability from over-work, giving calm, refreshing sleep."

With this quotation, which will serve to illustrate Dr. Fothergill's style of writing, we must bring our review to a close, although there are few pages we can turn over without finding such merits in the work as should command for it an extensive circulation among all classes of practitioners.

CHEMIA COARTATA. (a)

We have great pleasure in recommending this little volume to our readers.

Dr. Kollmyer has treated the subject not only in a tho-

(a) "Chemia Coartata; or, the Key to Modern Chemistry." By A. H. Kollmyer, A.M., M.D., Professor of Materia Medica and Therapeutics at the University of Bishop's College; Professor of Materia Medica and Pharmacy at the Montreal College of Pharmacy, Canada; and late Professor of Chemistry, &c. London: J. and A. Churchill. 1876.

roughly efficient and satisfactory manner, but with a certain amount of originality. Adopting a common procedure of many writers of somewhat similar text-books, the author commences by giving a general sketch of the main facts of elementary chemistry, such as a description of the molecule, the atom, the monad, dyad, triad, &c., and having placed these in a dry, clear light, plunges in *medias res.*

The chief point to which we would direct attention is the arrangement of the work; nearly the whole of the subjects are placed in horizontal lines, segmentally divided and headed as follows:—Substance, Synonyms, History, How obtained, Properties, Tests.

The lines extend directly across the entire work, so as to occupy both pages. If required to obtain a general knowledge of such a substance as oxygen, for instance, he can attain the end at a glance.

The method of description employed in reference to the organic part of the science is especially worthy of remark, since the whole is most carefully and accurately stated, the well-known difficulties of this section of the subject being presented in a more easily acquired form than we remember to have seen elsewhere.

The work terminates with a "Synopsis of poisons, their antidotes, and general treatment."

In conclusion, and in advocating the claims of "Chemia Coartata," we think we cannot do better than to quote the statement of the author in his preface, viz.:—

"That it will be found to be especially adapted to the wants of—

(1) Students intending to present themselves for examination.

(2) Persons who have learned the *old* notation and wish to become acquainted with the modern system.

(3) Those who desire to keep themselves posted on this subject, and who can thus easily refresh their memories without doing so at the expense of their other engagements.

NOTES ON ASYLUMS FOR THE INSANE IN AMERICA. (a)

This little book is a republication of some communications sent by the author to the *Lancet*, and which gave rise to a sharp controversy. This has happily now ended, and we cannot imagine why Dr. Bucknill should have decided on republishing what would have been far better if he had allowed to remain in obscurity. When a controversy has once ended, there can be no good in reopening it. There are certain points, however, in these notes which we cannot allow to pass unnoticed. Dr. Bucknill is an uncompromising advocate for the total abolition of mechanical restraint. Many of the American alienists, and not a few in this country, consider that there are particular cases in which some amount of mechanical restraint is not only indicated, but when judiciously used is less irritating to the patient than the continual struggles with his attendants, and which must be the case in some instances of acute maniacal excitement associated with violence; and we are of opinion that many of the injuries, and especially of fractured ribs, we read of as being perpetrated in asylums are due to the unwillingness of the medical officer to use restraint.

The question of the restraint system as opposed to the non-restraint system has been ably and fully discussed in the early numbers of Winslow's *Journal of Psychological Medicine*, as well as in other publications, and we can find nothing new on the subject; there are advocates on both sides, but we can assure Dr. Bucknill that there is no chance of our returning to the old system of chains and manacles, though we believe that the asylums of Jersey adopt the old system of restraint. We admit that in England at the present day there is an inclination on the part of medical superintendents to run into the opposite extreme, and altogether abolish restraint. What is required in America is a Central Board similar to our Commissioners in Lunacy, having similar jurisdiction and power, who would doubtless correct those abuses to which Dr. Bucknill refers as an eye-witness.

We now come to a subject alluded to in the book which has given great offence to many of our asylum superintendents, as also to our Lunacy Board. We allude to the "*Lancet* Commission." Dr. Bucknill surely is in error when he says this Commission is welcome to English asylums. Who constituted the *Lancet's* Lunacy Commission? What right have its officers to enrol themselves as visitors and enter into any of our asylums? According to this any newspaper might send its special reporter and set up a Commission. We have our Commissioners in Lunacy who visit six times annually. We have then an annual report which appears in June, containing most valuable and statistical information, the work of gentlemen who spare nothing to further the interests and well-being of the insane. What more do we want? The assumption on the part of the *Lancet* is simply ridiculous and impertinent.

Dr. Bucknill is displeased with the *American Journal of Insanity* for saying in reference to the *Lancet* Commission that "it is an insult to the Commissioners in Lunacy and the medical staff of every English hospital." We cordially endorse every word of this remark.

(a) "Notes on Asylums for the Insane in America." By John Charles Bucknill, M.D., F.R.S., late Lord Chancellor's Visitor of Lunatics. J. and A. Churchill, London.

A SYSTEMATIC HANDBOOK OF VOLUMETRIC ANALYSIS. (a)

That the previous editions of this work have supplied a want in chemical and analytical literature is evident from the circumstance that the second edition was out of print within three years of its appearance, and has been so for some two years, the reason for this latter circumstance being that the author's time has been too much occupied to admit of his giving up the requisite amount of time and labour to *verify from personal observation* the numerous novel processes and modifications of older methods which have cropped up during that period. That this should be the case is, in itself, testimony to the value of the matter contained, and to the accuracy of the information given. Unlike a large number of the writers who flood the chemical public with their text-books, the author does not content himself with a mere compilation without paying any attention to the experimental verification of newly made statements, but endeavours as far as is possible to check these by his own observations. The extent to which these non-observant compilatory manufacture of new books out of old ones prevails may be fairly illustrated by the circumstance that three, if not more, of the standard text-books on chemistry and chemical physic ("Miller's Chemistry," "Watts' Dictionary," "Cooke's Chemical Physics) whilst describing or alluding to certain of the phenomena of thermo-electricity, distinctly state that the current circulates in the wire connecting the two elements of the thermocouple in precisely the opposite direction to that in which it actually flows! clearly an error having been made by some writer in the first instance, subsequent compilers and copyists have reproduced and multiplied it. Now, if such is occasionally the case with standard works like those quoted, how much more likely is such a thing to occur in books written by less experienced authors? Mr. Sutton has, however, in his book, endeavoured to reduce the chances of inaccuracy to a minimum, by carefully examining himself experimentally many points not established long ago, and proved over and over again, but which have only been brought forward comparatively recently.

(a) "A Systematic Handbook of Volumetric Analysis; or the Quantitative Estimates of Chemical Substances by Measure, applied to Liquids, Solids, and Gases." By Francis Sutton, F.C.S. Third Edition. London: J. and A. Churchill.

The book is divided into seven parts, of which the first treats of the general principles of analytical volumetric work, with descriptions of the apparatus, modes of manipulation, &c. Part II. includes acidmetry and alkalimitry. Part III. analytical methods, involving oxidation or reduction, and Part IV, precipitation processes. In the fifth part the modes of valuation of a large number of bodies in accordance with these principles are detailed, whilst Part VI. includes systematic examination of bodies for various constituents, *e.g.*, water analysis, and Part VII. gas analysis.

The chapters on water analysis are most carefully and elaborately written, those relating to the vacuum-combustion process and the interpretation of the results thus obtained having been greatly extended by the contributor, Mr. William Thorpe, by whom the corresponding chapters in the second edition were written; the results of this writer's vast and almost unique experience in the Rivers Commission laboratory, and a large number of details and minor improvements worked out since the first publication of the vacuum process by Frankland and Armstrong, are incorporated in these paragraphs. It being beyond reasonable doubt that information as to the character of a water can be gained by this process which is *given by no other method*, and that the experimental errors and inherent defects in this process are at the highest valuation no greater than those of other methods, whilst in many cases they are far less, one is tempted to wonder how it is that so few water analysts use the vacuum process, and so many, comparatively, Wanklyn's permanganate process; the length of time required for the former method, and the manipulative skill requisite on account of the complexity of the apparatus, are, however, decidedly objections where competition cuts down analytical fees to a minimum, and consequently where rapidity and ease of execution are features more valued in an analytical process than strict accuracy.

In conclusion, we think that Sutton's volumetric analysis is a work which no skilled analyst can possibly afford to do without.

MEMOIRES SUR LA GALVANO-CAUSTIQUE THERMIQUE. (*a*)

In an interesting historical preface, the author reminds us that galvano-cautery originated in France in 1821, was adopted in Austria in 1845, then in Russia (1846), and found its way into England in 1850. But it was chiefly in consequence of the writings of Middeldorpf (1854) that galvano-cautery assumed its proper place in surgery. The author took up the subject about 25 years ago, and in 1853 he communicated the results of his researches to the Academy of Sciences of Paris. The present work embodies his previous writings, and gives the results of his latest experience, fortified by the details of the cases in which he has employed this method.

In the first section, twenty miscellaneous cases are reported, illustrating the use of the galvano-caustic wire loop. In the second chapter seven cases of ablation of pediculated tumours of the skin (fibroma, lipoma, &c.) are related, removal having been effected either by the galvanic wire loop, the cutting loop, or the galvanic bistoury. Drawings of the pathological appearances accompany each case. In many cases, a small battery is sufficient to heat the metal, *i.e.*, one composed of six elements of zinc and carbon, twelve c.m. in height and eight c.m. in breadth. The concluding chapter is occupied with the histories of twelve cases in which Dr. Amussat removed malignant growths from the neck of the uterus by the galvanic cutting loop. Among these twelve cases were two who remained in good health five years after the operation, and who would have succumbed to their disease if surgery had not stepped in to their aid.

This handsomely printed monograph, which is adorned with numerous fine engravings, is well worthy the attention of surgeons and gynæcologists, and it will doubtless help to *popularise* the employment of a means which is deservedly attracting increased consideration.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 10, 1877.

VACCINATION.

That the alarming spread of the present epidemic of small-pox and the great mortality it has already occasioned may shake the confidence of the public in the protective powers of vaccination is a probability which should not be lost sight of, especially by those who will hereafter have to give an official report of the causes which have occasioned this mortality. At a recent meeting of the managers of the Metropolitan Asylums District alarming reports were presented as to the spread of the disease. At Homerton it was stated not only had the small-pox hospital three over its number, but the fever hospital had been pressed into the service, and 233 out of 236 beds were occupied. Altogether, of 826 beds provided, 813 were filled. The rapid extension of the epidemic is shown by the fact that the number of deaths from small-pox registered in London for the four quarters of the year just passed are 7, 26, 110, and 592 respectively. Last week there were 75 fatal cases, of which 36 occurred in the hospitals at Homerton, Stockwell, and Hampstead, 1 in Highgate Hospital, and 1 in the North Street Infirmary, Poplar. The remaining 37, or 49 per cent., occurred in private dwellings. The hospitals contained 823 patients last Saturday week, against numbers increasing steadily from 185 to 737 in the nine preceding weeks. Moreover, at a special meeting of the managers of the Metropolitan District Asylums, held on Saturday, it was stated that at the Hampstead Hospital there were 318 beds occupied, and for want of further accommodation, the number of patients refused admission during the week had been 55. At the Homerton Small-pox Hospital 148 beds were provided, and 84 applications for admission had

been refused. At the Homerton Fever Hospital 258 beds were occupied, and 20 had been refused admission. At Stockwell 157 beds were occupied, but the return of patients refused had not been given. Thus it would be seen that during the week there had been something like 200 patients refused admission to establishments under control of the managers for want of accommodation.

Alarming and apparently discouraging as these statistics are, the great mortality which they show arises, nevertheless, from conditions which prove the efficacy rather than the failure of vaccination, and, indeed, this mortality is no greater than was foreseen by the writer, who drew up the last official report respecting the great epidemic of small-pox in 1871-3, for in that report the writer significantly remarks that unless re-vaccination be adopted by our present adult population and by our present adolescent population when they are grown up to a much larger extent than has been done, there must in the next and in the succeeding epidemics for some time to come be a not inconsiderable amount of adult mortality. Now it can be shown that the mortality which small-pox is now causing is entirely due to the neglect of three great conditions of security from the disease, viz., vaccination in infancy, re-vaccination, and the complete and effective performance of the operation, and it may be most confidently stated that had these conditions been universally in operation, although many might have contracted small-pox, not one fatal case would have occurred during the present epidemic, while the very existence of the disease to the extent of being an epidemic would have been an impossibility. It is, therefore, surely worth while to bring forward a few facts in proof of such a statement, and if this proposition is shown to be perfectly true, it is certainly one that should be ever present to the mind of every adult member of the community, and especially of the members of that profession to whom the prevention of disease has been always as much a duty as its cure or alleviation.

With regard to the protection afforded by infantile vaccination for the first six or seven years of the child's life, there has been such a large accumulation of evidence adduced that it would be difficult, even were we inclined, to make a selection, but this protection is so generally admitted that a brief reference to it is all we need make. We may, however, premise the important fact that children are so liable to contract small-pox that, when in 1853, the Epidemiological Society drew up their report, no less than 70 to 80 per cent. of the entire small-pox mortality of Great Britain and Ireland occurred under the age of five years, and 25 per cent. even under the age of one year. With respect to the protective power of vaccination at this age, we need only give one illustration. Up to the date of the compulsory vaccination law the average annual deaths from small-pox in Scotland among children under five years of age constituted 74 per cent. the whole mortality from that disease ; whereas, in 1871, when the last epidemic broke out in that country, the proportion of deaths under five years of age to the total deaths from the disease had become considerably less than 1-4th, was, in fact, not very much more than 1-5th. Moreover, in the general annual report of the Registrar-General for Scotland for 1872, it is stated that "if the same relative mortality had taken place among children at that age (under five years) as occurred during the previous epidemics, when they were less efficiently protected by vaccination, instead of only 362 children under five years of age having died from small-pox in the eight towns during 1872, 3,370 would have died. The enforcement of the Vaccination Act, therefore, during the seven previous years, appears to have had the effect in those eight towns alone, of saving the lives of upwards of 3,000 children." We might also refer to examples of the remarkable protection afforded by vaccination recently quoted by a medical contemporary from the *Medizinisches Chirurgisches Centralblatt*, in which, in five different families, each consisting of several children, those children who had not been vaccinated were attacked with the disease and mostly died, while those who were protected either escaped altogether, or had it but slightly. In fact, of the eight who had small-pox no less than seven died, and one recovered with the loss of an eye. Nor is it to be forgotten that an analysis of the mortality during the late epidemic showed that the deaths under 15 years of age were nearly all in the unvaccinated.

With regard to the second condition of exemption from a fatal attack of small-pox, Dr. Seaton observes that the observations which were made during the last epidemic afforded remarkable evidence of the value of re-vaccination, not merely in controlling the mortality from small-pox, but preventing altogether the occurrence of the disease. Its power of preventing small-pox under circumstances the most favourable of all others for contracting it was tested on a very large scale on the nurses, servants, and attendants of the various hospitals established for the treatment of the epidemic in the metropolis and in the provinces, the attendants in the hospitals of the Metropolitan Asylums District alone amounting at one time to above 300. Yet in every hospital report which Dr. Seaton received, it was stated that not a single one of these officials, who had been re-vaccinated before coming to take duty at the hospital, contracted small-pox.

Lastly, we come to the third condition—the perfect and effective performance of the operation. This is a condition to which we, as medical men, cannot pay too much attention, considering that we are mainly answerable for all the imperfectly vaccinated cases that are now at large, and consequently for the risk of contracting the disease and even the risk of death incurred by those in whom the operation has been but imperfectly performed. That the protection against small-pox afforded by vaccination depends in a great measure upon the number and character of the pustules produced by it is a truism which no one would think of disputing, but, unfortunately, there are strong grounds for believing that the operation is very carelessly practised, so that instead of finding on the eighth day from four to six well-formed vesicles, there is only one or at most two, those but small and imperfectly filled with lymph. To the truth of these last remarks the opinion of Dr. Seaton, and more especially the valuable evidence of Mr. Marson, bear very strong testimony. The former observes that, during the last epidemic (two years it is true of intense epidemic influence) a large number of adults, probably from 9,000 to 10,000,

who, in a rough and general sense, must have been vaccinated, perished from small-pox. Much of this mortality may have been due to the neglect of re-vaccination; but, in the opinion of Dr. Seaton, it may be affirmed, with the utmost confidence, that these cases were, with comparatively few exceptions, cases in which the vaccination had not been thoroughly and efficiently performed. Of a much more crucial nature, however, is the evidence adduced by Mr. Marson on this important subject. Seventeen years ago, before the outbreak of the last epidemic, Mr. Marson, in "a memorable communication to the Royal Medical and Chirurgical Society, founded on his (even then unequalled) experience of small-pox at the London Small-pox Hospital," showed that the fatal small-pox which, during sixteen years' observation he had met with in that hospital in persons in whom vaccination was said to have been performed, had been almost entirely in cases in which the vaccination had been imperfect, the vaccine marks being either wanting in essential characteristics or deficient in number, or both. He also demonstrated that, apart from any question of the different relative liability of well and ill-vaccinated persons *to contract* small-pox, any vaccinated persons who *did* take it had it either slightly or severely, and either with scarce any risk of death or with a risk not inconsiderable, *according to* the quality of the vaccination they had received.

We have already trespassed so far beyond the space allotted to us that we must bring our remarks rather abruptly to a close, but enough has been said to show how much the thorough and effective performance of vaccination and re-vaccination, and consequently the immunity of the people from future epidemics must rest with us. There is scarcely a family in the United Kingdom who is not frequently in the course of the year under the notice of their medical attendant; and it follows, therefore, that he has every opportunity of seeing that no family committed to his charge shall incur the least risk of contracting such a terrible, and yet such a preventible, disease as small-pox. There is all the more reason for medical men and the public co-operating with respect to the systematic performance of this operation, seeing that when these terrible outbreaks of the disease come upon us, they find, as recent events have shown, the sanitary authorities totally unprepared to grapple with them, and to provide such accommodation as shall effectually isolate the sick from the rest of the community.

THE COMING ARMY COMPETITIVE.

THE Director-General has issued another advertisement of the approaching Army Examination, in which he sets forth the terms offered by the Royal Warrant to competitors. The tenure of appointment is stated by the advertisement in the identical words of the Warrant, and the public is given to understand by it that candidates will, *under all circumstances*, be entitled to their £1,000 if they be not retained in the Army Medical Service after ten years. It is remarkable, however, that the clauses of the warrant which convert the ten years' tenancy and final compensation for loss of office into a tenancy at will and a summary eviction without a penny are carefully omitted, and the advertisement, as it stands, is a complete misrepresentation of the facts.

An army surgeon appointed under the new warrant will be liable to be sent on foreign service at any moment. If his health break down while on service within the first five years he will be allowed six months *without pay* to get well, and if he cannot complete the task within that time, he will be ejected without a shilling in his pocket. If he be fortunate enough to hold out till five years' service have elapsed before breaking down in health, he will also be liable to be kicked out, and will then receive a compensatory payment, not of £1,000, but of a less sum, perhaps as low as £200.

A ten years' tenancy, with these conditions, is a very different bargain to a similar tenure without them; and it is hardly honest for the Army Medical Department to withhold the real nature of the bargain from their published advertisements.

The misdeeds of the Department are crying for "foreign intervention" with as much force as ever those of Turkey. The special army correspondent of the *Irish Times* writes last week as follows: "When Surgeon-Major De Chaumont was appointed the other day to the professorship of military hygiene at the Army Medical School, he had to retire upon half-pay. Yet Surgeon-General Longmore has for years past filled the professorship in the department of military surgery at the same institution, and there would seem to be no disposition to interfere in any way with him. It is not easy to understand why Dr. Longmore should be treated with so vast an amount of consideration, as it is not customary to find the convenience of junior officers studied. The Army Medical Department, there is no disputing, is in a most serious condition. I cannot blind myself to the fact that Sir William Muir is proving a most indifferent Director-General. An officer holding an important position on the medical staff was trying to convince me lately that Sir William Muir is not so much to blame as the War Secretary, in the matter of the discontent now raging throughout the army with regard to the medical arrangements. Such an argument is simply nonsense. Sir William Muir is the Director-General, and if he were to set his face determinedly against unification, I know for a fact the War Office would give in to him. And even if it did not, there would still be a course open to the worthy doctor—he could resign his appointment. If he adopted this latter course, matters would very soon be brought to a climax. To me it is wonderful that a man so able as Sir William Muir undoubtedly is, should allow his reputation to be injured by the persistency with which he adheres to a system possessed of no single redeeming quality. Where all is bad, and there exists no one good point, failure is inevitable sooner or later; and why ruin a whole department by deferring the evil day, when a change will be forced upon us, perhaps, in face of an enemy?"

It is in the face of this state of things, and with war staring Great Britain in the face, that the War Office is trying to wheedle students into the service. For every reason, we advise them not to be persuaded. An English general practice, an Irish dispensary, or a colonial appointment will afford any man of brains, education, and energy a far better chance of eventual success and independence than the British army. The £1,000 is but

a shadow; and even if it were a reality, it can never pay a surgeon for the loss of the ten best years of his life.

Notes on Current Topics.

Anthropology.

On Wednesday week, at four o'clock, p.m., the new School of Anthropology of France was inaugurated at the "Ecole Practique" of Paris. The ceremonial was opened by a speech from M. Broca, who was received with every demonstration of good-will. In a lecture full of interest, having defined anthropology as the natural history of man, he referred to the whole field embraced by that science, and to the intimate relation between it and medicine, zoology, and geography. The organisation of the school is complete, and it will add a new arena of scientific study to the already distinguished French school.

Naivetes of Homœopathy.

In *l'Art Medicale*, of Brussels, we read the following anecdote. Some days ago a prescription, emanating from a well-known homœopathic doctor in Brussels, was handed to the narrator. This recipe prescribed for an attack of neuralgia *the third trituration of nitro-glycerine*. Being curious to know the method of pulverisation used by the homœopathic chemist, to whom the prescription was addressed, the narrator begged to be told the method by which nitro-glycerine was triturated with sugar of milk, without great danger of an explosion which would blow the establishment into a thousand fragments. He was answered with imperturbable coolness, "The triturations of nitro-glycerine are a pretence. It is quite clear that we cannot triturate so explosive a body, so we give the patient only the sugar of milk"—*Ab uno disce omnes.*

Hydrophobia communicated by Non-rabid Dogs and Cats.

Apropos of the discussion now taking place in the leading daily papers, the *Veterinary Journal* relates a case recently brought before the St. Petersburg Medical Society, by Dr. Moritz, of a boy who died with well-marked symptoms of hydrophobia six weeks after being bitten by a dog—the dog up to the time of the boy's death never having exhibited any signs of rabies. A similar case was communicated to Dr. Moritz by a colleague, of a boy who died hydrophobic, after being bitten by a cat—the cat remaining to all appearances well. Dr. Severin had also met with a case of a child dying, who had been bitten by a dog that continued well. He had inoculated rabbits with saliva, blood and pus taken from this child, but without producing any results. By the way, what will the anti-vivisectionists say to the latter part of this paragraph? We make them a present of it, they will doubtless be able to turn it to *good* account.

Hospital Sunday at Newcastle-on-Tyne has realised £3,226, which is less by £250 than the year previously.

Certificates of Proficiency in Vaccination.

The attention of the Council of the College of Surgeons having been drawn by the General Medical Council to the defective character of the certificates of proficiency in vaccination received by some of the licensing bodies, it has been resolved, says *The Students' Journal*, that on and after May 1st next, all candidates, either for membership or fellowship of the College, must produce such certificates of proficiency in vaccination as will entitle their holders to contract as public vaccinators under the regulations at the time in force, of the Local Government Board.

Medical Qualification of Women.

Miss Edith Shove having applied to be examined at the University of London for a medical degree, legal opinion has been taken; and in the opinion of the law officers consulted, women cannot be admitted to the University Examinations for medical degrees, but that the Senate might, if it thought fit, with the approval of the Home Secretary, alter the regulations so as to allow women to come up for examination.

Homœopathic Surgery.

A homœopathic practitioner at Bathurst, New South Wales, has been committed to take his trial on a charge of manslaughter, death having resulted from his improperly lancing a cancerous tumour of the neck.

Compulsory Vaccination in Bombay.

At a meeting of the Bombay Legislative Council, on the 4th ult., the principal business transacted was the first reading of a Bill to make vaccination of children in the city of Bombay compulsory. The native community have supported the Bill.

Mortality from Wakes.

Dr. Goldie, the Medical Officer of Health for Leeds, in his report to the local authority, states that every one of thirty people who attended the wake of an Irish girl who recently died in that town from typhus fever, have been attacked by the same disease, and no fewer than nine of the cases have already ended fatally.

Antipodean Journalism.

We have reason to learn by recent experiences, as well as by a perusal of Antipodean medical literature, that one must cross a few thousand miles of ocean before it becomes safe or the fashion to "call a spade a spade" in medical matters. The unadulterated truth is wholesome at all times, but there is a limit to the quantity of spice with which it may be flavoured, and propriety forbids us to go the lengths of our contemporaries of the New World in our denunciation of professional rascalities. The *Melbourne Medical Record* shows us an example of plain speaking which we do not mean to emulate, but simply quote for the amusement of our readers, and to illustrate differences of taste of medical readers at each side of the globe. In double-leaded type the Editor publishes a letter of a correspondent, in which the following choice

passage occurs. After a choice tirade against political rascality in Melbourne the writer says :—

"A somewhat similar state of affairs is in existence in in the medical profession. A self-elected crew of miscreants have pushed themselves forward as the representatives of the faculty, and while enriching themselves have disgraced the respectable members of the profession as far as it was in their power to do so. Wherever two or three of those foul-mouthed bullies are gathered together there is sure to be some scandalous piece of ruffianism enacted which could emanate from no other source. But then what can we expect from abortion-mongers? Nothing better than what we are receiving until two or three of them, as you remarked in your last number, are strung up by the necks. Then things may improve."

"Milk of Sulphur" Frauds.

PROSECUTIONS took place last week at Runcorn against three chemists for selling adulterated milk of sulphur. The case was defended at the instance of the Chemists and Druggists' Trade Association, and it was stated that the present prosecutions would be regarded as test cases.

Dr. Bell, of Manchester, stated that the milk of sulphur purchased contained 58½ per cent., and in one case 65 per cent. of sulphate of lime; and for the defence, Mr. Pemberton, of Birmingham, and Dr. Redwood, of London, were called, who spoke to the general use of milk of sulphur, and said that it was much more beneficial on account of sulphate of lime. Messrs. Evans, wholesale druggists, of Liverpool, said they sold thirteen times as much milk of sulphur than they did of the other preparation. Milk of sulphur was known to contain sulphate of lime, and was extensively used by the medical profession. The Bench decided to convict, *on the ground that the article supplied was not that which was asked for.* In each case a fine of £1 and costs was inflicted. Notice of appeal was given.

We are well pleased that the defence of this adulteration fraud by the Chemists' Trades Union has proved futile, and we commend the Bench for the honest and sensible view of the case which they took. Whether the "milk of sulphur" is more beneficial or more largely sold than the pure article has nothing to say to the question. It is not sulphur, and it is palmed off upon the purchaser by dishonest druggists as such, despite what they may say to the contrary. It is not true that the article is known by *the purchaser* to contain sulphate of lime, and the druggists carefully conceal the fact in order to sell it more readily. As usual, we grieve to say the *Pharmaceutical Journal* apologises for the fraud, and we are still further astonished to observe that the *Lancet* enters the lists in defence of such trickery, and defends the trade in adulterated sulphur with the lamest arguments. "Milk of sulphur," says our contemporary, "does not mean pure sulphur, but a particular preparation, and we think the Runcorn magistrates were in error in deciding that a purchaser who went to a certain shop for milk of sulphur did not get what he asked for. If he wanted pure sulphur he asked for the wrong article, which was not the fault of the tradesman. The man who wants bread and asks for a cake cannot reasonably abuse his baker."

Our contemporary must surely see that all this is untrue. The purchaser does not, in this instance, ask for cake with the knowledge that he is asking for something different from bread. He is made to believe that cake is bread, the baker carefully concealing the fact that it is not so lest he might prefer the less remunerative article. He cannot reasonably be expected to bring any such knowledge to the matter, and it is, therefore, not a case of *caveat emptor.* The druggist is bound in all fairness, to describe honestly what he sells, and we maintain that "milk of sulphur" is not such an honest description, but is a term used for the purpose of deceiving the purchaser.

Lunacy in Ireland.

THE Inspectors of Irish Asylums in their recently published Report state that on the 31st December, 1875, the number of patients mentally affected, and within their immediate supervision, amounted to 11,777, or 194 more than at a like date in the preceding year, while those at large, comprising not alone lunatics in the recognised acceptation of the term, but idiots, epileptics, and imbeciles were estimated at 6,848. The total insane accommodated at the end of last year, irrespective of the type of their maladies, were thus distributed :—

In District Asylums	7,741
In Central Criminal Asylum . . .	172
In Lucan Government Asylum . .	29
In Private Asylums	653
In Poorhouses	3,199
In Gaols	3
Total	11,777

If to the above be added the unregistered, or those returned as living with their friends or not having any fixed habitation, and as regards the great majority under the denomination of idiotic, weak-minded, and epileptic, the general aggregate would embrace 18,625 individuals as labouring in Ireland under some diseased manifestation of mind—being in the proportion of 3·20 per thousand to the whole population.

On comparing the statistical returns for 1874 and 1875, we find that in the insane at large there is an excess of 44, but a diminution in the lunatic element properly so called, by 280 persons; this latter result is satisfactory, as indicating that cases likely to benefit by scientific treatment, are being drafted to suitable receptacles.

There appears from the general data that there was a total of 9,717 lunatics under treatment in the course of the year, and at its close 7,741, or 156 more than on the 31st December, 1874, in Irish District Asylums.

Anaphrodisiac Properties of Tobacco.

CONSIDERING the enormous amount of tobacco consumed at the present day by all classes of society, and the early age at which smoking is often commenced, the influence of this habit on the generative functions is certainly a matter of grave importance. In looking over the pages of the *Canadian Journal of Medical Science*, we came across a translation from the *Jour. de Med. et de Chir.*, May, 1876, in which the writer observes that: The anaphrodisiac properties of tobacco have been long known, as Foussard has well shown in his work, and have induced its use in the numerous convents in Italy. When the cause of impotence is obscure, it is well for physicians to remember this noxious property of tobacco as the following cases observed by the author show

A young man who smoked more than twenty cigars per day, complained of loss of digestive power, weakness, feeble memory, and impotence. As he was about to marry, he consulted a physician. The latter, aware of the habits of his patient, ordered him to discontinue the use of tobacco, which was followed by restoration of the genital function.

. . . . . .

A young and robust stu dent of the Polytechnic school became inspector at a tobacco manufactory. He soon experienced considerable loss of genesic power and finally became impotent. Both the patient and physician agreed as to the probable cause of the disease, and after vainly making trial of other remedies, the inspector of tobacco engaged in another business, when he speedily recovered his generative power.

The sedative and benumbing effect of excessive tobacco-smoking over the sexual appetite and sexual powers has been denied by many physicians; and many years ago when an inquiry into the influence of this habit upon the constitution in general was conducted by one of our medical contemporaries, it was found that out of the large number of persons who volunteered their own experience on the subject, only two or three complained of the injurious effect which smoking appeared to have on their sexual vigour. From several instances that have come under our notice, and from the experience of others, we have every reason to believe that smoking carried to excess acts decidedly as an anaphrodisiac, especially in persons of a nervous, or lymphatic temperament, or in those whose generative organs are not by nature very vigorous. M. Marc, in *Dict. des Sciences Médicales*, t. xxiv., p. 176, considered that the use of narcotics, especially tobacco, hyoscyamus, cicuta, and opium, was a cause of functional impotence. Dr. Copland, (*Dict. of Pract. Med. Art. Poisons*), calls smoking an enervating, emasculating luxury and observes that the offspring of those who indulge in it in excess, are often weak, puny, and stunted in growth, or of a nervous, susceptible and scrofulous conformation. We must also bear in mind that this is a question which the profession, from a feeling of delicacy are seldom inclined, or will not take the trouble, to inquire into, and one reason for our making a note on the subject, is our firm persuasion that the influence of this and other habits, incidental to modern civilisation upon the health of the community, has not received a due share of attention from medical men, especially from that class of practitioners, who from their long and intimate acquaintance with many of their patients, have a good opportunity of collecting valuable evidence on the question we have just raised.

Magisterial Abuse of the Lunacy System in Ireland.

The Inspectors of Irish Lunatic Asylums in their recent report, examining into the probable cause of the increased mortality within asylums during the last year, attribute it in part to the number of hopeless, indeed it might be added moribund, cases transmitted under magisterial warrants to asylums as being dangerous and violent. They say that an injudicious exercise of power in committing lunatics has perceptibly increased, notwithstanding the issue of official circulars directing the attention of justices of the peace to the specific and intelligible clauses of the statute. Last session, in order to obviate this objectionable practice, an Act was passed, by which two governors of any district asylum, in accordance with certain engagements on the part of the friends or relatives of an insane patient, could authorise an immediate admission into the district asylum where the party resided. Though this law has nominally been in operation for over nine months, little or no advantage has been taken of it. The Inspectors say:—

"In our official capacity, while anxious to render public institutions for the insane beneficial to society in every reasonable manner, we should regret if an uncalled for expenditure of money were to be entailed without some commensurate utility. For the one lunatic received into an English asylum, on the ground alone of being dangerous, by direct magisterial warrant, and not in the ordinary and recognised mode of application, we apprehend, relatively speaking, that at least ten are so transferred to Irish district institutions, in which, when once located, be they from the first quiet, naturally inoffensive imbeciles, or helpless from age and infirmity, they remain as a rule for life. To obviate the inconveniences likely to accrue thereon, a clause of the Act just named empowers the removal of a certain class of inmates from public asylums to poor-houses, on an understanding being arrived at between the Local Government Board, the inspectors, and union guardians; but as yet, we may say, no practical arrangements have been effected. Local guardians, as a rule, are too desirous to get rid of the insane of all classes to accept with favour the proposition of receiving new cases, cognisant at the same time that the Government rate in aid would diminish taxation £10 4s. per annum in favour of each district asylum resident."

Drunkenness or Apoplexy.

Many months ago we drew attention to the lamentable mistakes that are frequently made by the police in locking people up all night for drunkenness, when they have been really overtaken by a serious, and often fatal, malady. But, perhaps, in no case have more blundering and neglect been shown than in that of Mary Hannah Francis, an inquiry into whose death was held a few days ago by the coroner (Mr. W. J. Payne) at St. Bartholomew's Hospital. This woman, the wife of a respectable tradesman, was seen by a policeman to be "staggering' along Cheapside about six o'clock in the evening, and with her bonnet lying upon her shoulders. She was about to fall, when some gentleman got hold of her arm until the policeman came up, and (supposing she was drunk) took her into custody. She was taken to the station, where she was put in "the cell," and laid upon the floor, with a cushion under her head. About one o'clock in the morning one of the inspectors visited her, and finding her worse, placed her in a cab, and sent her to the hospital. On arriving there, it was found by Mr. P. H. Hart (the house-physician) that she was suffering from apoplexy and paralysis, from which she died on the following day. The coroner, in summing up, very properly observed that there could be no doubt as to the desirability of a surgeon's opinion being called in in such a case. The English people could not countenance such a state of things as a respectable woman being taken through the streets of the City in such a manner by the police. It was a degradation which could not be allowed.

The jury, moreover, added (as a rider to their verdict) that the police had been guilty of culpable and gross negligence, and hoped that greater care would be taken for the future.

Now, we may ask, *will* greater care be taken for the future? We very much doubt it, unless some very decided instructions be issued to the police force by the authorities at Scotland Yard. What we have to complain of is not so much the police mistaking apoplexy for drunkenness (as this is an error into which even the experienced physician may occasionally fall), but of the careless and summary manner in which they jump to a conclusion; and where there is any doubt about the case, we have to complain of their not acting in such a manner and sending for such professional assistance as will either settle the question of drunkenness or dying, or place the patient in such a position as will offer the best chance for his recovery. When we last touched upon this subject, we suggested that a "Notice" should be posted up at police-stations, not only laying down certain rules by which they may be able to distinguish drunkenness from apoplexy or from sunstroke (which, during very hot weather, has been often mistaken for drunkenness), but giving strict orders that whenever there is the least doubt about the matter, the divisional surgeon or some other surgeon should be immediately sent for. In the case before us, the duty of the police was very clear. The deceased was a respectably-dressed woman. Her breath did not and (judging from the post-mortem appearances) could not have smelt of any intoxicating liquor; and there was no evidence to show that she had been drinking, or had been near any public-house. There was therefore, a strong presumption in favour of her having been suddenly taken ill, and the conduct of the police should have been in accordance with that presumption.

Home and Foreign Reciprocity of Licences.

Our French cousins, it would appear, are about to pay us in our own coin, and that the French universities are promoting a bill in the Chamber to forbid British or any foreign practitioner from practising in France without a French education and a French licence.

We, who believe so fully in the standard of education maintained in Britain find it hard to conceive that British degrees shall not pass muster in France, but we must remember that within the last half-year we have ourselves refused to allow the currency of French degrees in Great Britain. Mr. Cowper-Temple introduced a Bill in last Parliamentary Session to legalise women's foreign licences amongst us, and it was at once rejected upon the very proper ground that the Medical Council which guards the purity of our home licences (or rather is supposed to do so) has no means of guaranteeing the authenticity of foreign degrees. We are, in fact, about to be hoist with our own petard, and can hardly complain, but it seems evident that some plan must be devised by which reciprocity between home and foreign qualifications of high standard shall be established. We do not, indeed, see much difficulty in the matter. The surveillance of the Medical Council over British licensing bodies has not been very close or effective, and, in the field of preliminary examination, the Council has recognised Tasmanian and Australian tests over which they have no inspectorial power and no control whatever. If there were in France a Government *imprimatur* for colleges and universities, the institutions holding that *imprimatur* might very properly be admitted to reciprocity with British licensing corporations.

Medicine and Surgery in Ancient Ireland.

In a recent lecture, Dr. Mapother brought forward evidence to show that the yellow plagues of 547 and 664 were small-pox, and that the many so-called leper hospitals were established for the victims of the above-named acute and contagious disease. The oriental or bubo plague he believed to have been due to the entrance of bacteria into the blood, and to have been therefore the human analogue of the epizootic known as splenic apoplexy, or soldier. The sweating sickness he regarded as a terribly acute rheumatism, like the "cardiac disease" of the time of Alexander the Great, and he explained the striking immunity of the Irish by their less luxurious habits. Amongst evidences of early surgical skill, he adduced the trepanning of King Connor, A.M. 3950, and the tight bandaging of the limbs in cases of internal hæmorrhage. About 840, the Danish King in Ireland ordered the cutting off of the nose as a penalty for non-payment of taxes. Only one such outrage is remembered in Ireland, and that was for a very different motive. In 1559, Lord Viceroy Sidney was cured of stone in Dublin by lithotrity, an operation first performed A.D. 15, by Ammonios of Alexandria. The very early foundation of barber-surgeons in Ireland (1446) was attributed to the law of Henry VI., forbidding the wearing of beards (Rot. Parl., cap. 20). Speaking of the foundation of the College of Physicians, Dr. Mapother quoted a prescription of Sir P. Dun for General Ginkle, then in camp, in 1691. This President, contrary to all etiquette, likewise dispensed the prescription which was as follows:—"℞ Chester ale, claret, potted chicken and grean (*sic*) geese. This is the physic I advise you to take. I hope it will not be nauseous or disagreeable to your stomach. A little of it on a march."

Scurvy in the Arctic Expedition.

A Select Committee, under the presidency of Sir James Hope, is appointed to inquire into the causes of the outbreak of scurvy in the last Arctic expedition, and evidence on the subject will be taken from mercantile marine as well as Royal naval authorities. The case as it stands seems to have been as follows:—The experience of former Arctic expeditions show clearly that scurvy has been a source of great trouble and danger to sledge parties, though it passed unnoticed under the name of "sore legs," &c. It was, therefore, to be expected that it would occur in the sledge expeditions of 1876, and the medical officers accordingly advised that lime-juice ought to form part of the equipment. Captain Nares in the exercise of his discretion did not send it the whole distance, but only as far as the depots which were about half-way, and we know how disastrous was the result. On the other hand, it

must be stated that former sledge expeditions did not take lime-juice with them—that it would have burthened the party, including the fuel necessary to melt it, and the water for its dilution—with a weight of nearly 50lbs. per man, that, inasmuch as the amount of the load per man was constant, to take 50lbs. of lime-juice and fuel, was equivalent to leaving behind 50lbs. of other important supplies. It was, therefore, apparently a choice of what could be done without; and Captain Nares seems to have decided that lime-juice was the least essential part of the supplies.

Army Medical Charges.

THE Army Medical Department has at length tardily redressed the gross injustice of compelling medical officers to subscribe to mess and band which they were not privileged to enjoy. The following general order has been promulgated :—

"1. Referring to Clause 2, Army Circulars, 1877, medical officers will not in future be called upon to contribute or subscribe to regimental messes and bands.

"2. This order will take effect from 1st January, 1877, and any contributions or subscriptions which may have been paid in advance beyond 31st December, 1876, will be refunded.

"3. Paragraphs 39 and 52, Section 7, 'Queen's Regulations and Orders for the Army, 1873,' will be amended accordingly, and paragraphs 2 and 3 of G. O. 11 of 1876, are cancelled."

A Royal Warrant has also been issued, which directs that for the future Surgeons-General and Deputy Surgeons-General of the Indian Medical Service are to rank as Majors-General and Colonels respectively, according to the dates of their commissions. This step was rendered necessary by the increase of rank which the last Army Medical Warrant conferred upon Surgeons-General and Deputy Surgeons-General of H.M.'s British troops.

Increased Fees to Medical Witnesses in Ireland.

WE learn with satisfaction that the representations made to the Attorney-General for Ireland by the deputation of the Irish Medical Association, have resulted in the issue of an order from the Attorney-General to Crown Solicitors, that a fee of £2 2s. (instead of £1 1s. which has hitherto been paid), shall in future be paid to medical men for their evidence at sessions. This concession may be regarded as evidence of the disposition of the authorities to deal justly when circumstances deserving of their consideration are brought to their notice. We trust, therefore, that the other points impressed by the deputation upon the Attorney-General will, at some future time be yielded by the Government.

Dublin University Medical Faculty.

THE following new arrangements have been notified by the registrar of the School of Physic :—

1. *Half M.B. Examination.*—After 1st January, 1877 this examination shall consist of three distinct parts—viz.
   1. Botany and Materia Medica.
   2. Physics and Chemistry.
   3. Descriptive Anatomy.

II. *B.Ch. Examination.*—After 1st January, 1877, five per cent. marks shall be allotted to each of the subjects of Surgical Appliances and Surgical Pathology, in lieu of ten per cent. of the marks hitherto given in General Surgery.

III. *M. A. O. Examination.*—Candidates must be graduates in both Medicine and Surgery.

CURRICULUM.

1. One winter course in Midwifery.
2. Six months' practice in a recognised lying-in hospital or maternity.
3. A summer course in Obstetric Medicine and Surgery.
4. Two months' practice in the Cow-pock Institution.

N.B.—Existing graduates in medicine of the standing of M.D. are entitled to present themselves for examination without complying with Regulations 3 and 4.

IV. *Diploma in State Medicine.*—Candidates are allowed to present themselves for examination at any time after passing their M.B. and B.Ch. Examinations, instead of waiting (as heretofore) for the standing of M.D.

SAMUEL HAUGHTON, Medical Registrar.

29th December, 1876.

The Medical Council and the Defence Association.

LAST week a deputation from the Medical Defence Association waited on the executive committee of the General Medical Council in reference to the penalties recovered under the Medical Act. Dr. Richardson, President of the Association, stated that the Defence Association had taken counsel's opinion, which was to the effect that the receiver of police was entitled to retain the penalties. Under these circumstances the council of the Defence Association having incurred considerable expense in enforcing the Medical Act, appealed to the Medical Council to take action with a view to the penalties being applied to the expenses of carrying out the Act. The President of the Medical Council said that it gave the committee much pleasure to meet the deputation and to hear their views on this question, which, he might say, had already occupied their attention. The courses open to them were to endeavour to obtain an amendment of the Medical Act, so that it would not be affected by the clauses of the Metropolitan Police Act, or to apply to the Lords of the Treasury, asking them to resign their claim to the penalties. He (Dr. Acland) had been requested by the Medical Council to address the Treasury in this sense, but had delayed doing so until after he should have had an opportunity of hearing the views of the deputation. He would now do so at once, and the result would be duly communicated to the Association.

It is somewhat surprising to find the Medical Council even permitting others to do its own work as a prosecutor of illegal practitioners. Hitherto, we have heard the statement made that the Medical Council is not a prosecuting body, until that observation has become almost an axiom. We regard such an idea as wholly untenable. The Medical Council was created for the purpose of establishing and maintaining proper guarantees of competency amongst medical practitioners, and they have wholly neglected one half of their duty in this capacity. If it be the business of the Medical Council to see that the public is protected against half-competent doctors, it is surely—*a fortiori*—

their business to defend us against wholly incompetent quacks.

Scarlatina in Connemara.

FOR some time past a virulent type of scarlatina has existed in Connemara, particularly within the districts embraced in the Clifden Union. Respecting the disease, the following report was at the last meeting of the board of guardians of that union submitted by Dr. Byrne, *pro tem.* medical officer:—

"For some six weeks past a most malignant epidemic of scarlatina has prevailed in your district, especially in the low lands near to or skirting the seashore; and, as your medical officer of the workhouse *pro tem.*, as also medical and sanitary officer of the district, I consider it my duty to report to you that, in my opinion, the virulence of the epidemic has been much increased by the use of contaminated water by the general public. They almost invariably use, for all purposes, the water running off the roads and passages, which is, as a rule in the lowlands largely contaminated with animal impurities of every description, flowing as it does into drains from dung heaps and other receptacles for refuse incidental to human dwellings. If wells for water in the hillsides, or even in the lowlands, into which the drains referred to had not access, were alone used by the inhabitants for drinking or culinary purposes, it would much tend to the improvement and maintenance of the general health of the district. And I most respectfully suggest that the guardians and members of the dispensary district should make this, my decided opinion, known to the inhabitants in such manner as may be considered desirable, in order to have discontinued, as much as possible, so great a danger to the health of all classes, and which, as far as I can judge, only exists in consequence of the prevailing absence of information as to its existence and attendant consequences."

The report of Dr. Byrne was ordered to be printed and circulated extensively throughout the district.

Limited Medical Skill.

WE find in a Dublin paper the following:—"Wanted immediately, an experienced woman, who will make herself useful; accustomed to sickness; *she must understand feeling pulses*, but not be a trained nurse."

The Working of the Irish Sanitary System.

IN the course of the recent investigation of the Government Commissioners into the state of Cashel, Dr. Laffan, the consulting sanitary officer, gives the following evidence:—

"The duties of my office have been rather impracticably drawn up. I am only to give advice when it is asked for; the result has been that on many occasions when the board needed advice, I was prevented from offering it. One notable instance occurs to me—it is that of an outbreak of fever, which occurred in a little town in the union, where, had proper steps been taken, the epidemic would have been cut short. In that case the Board never even thought of the necessity of asking advice. Cashel, being under 6,000 in population, was merged by the late Act in the rural sanitary district. I am decidedly of opinion that the sanitary administration was not improved by the change. The corporation was more attentive, had more local knowledge, and took a keener interest in the sanitary matters than the present authorities. The Local Government Board have recently informed me that, while I am at liberty to remind the other sanitary officers of any neglect of duty on their parts, I am not actually bound so to do; this makes interference somewhat invidious. The Sanitary Act has not been worked for a variety of reasons; the officers are not numerous, their professional interests are ever clashing with their sanitary duties, they are too ill-paid, and they should have received a special training: there ought to be but one officer for each union, and he should be prohibited from all private practice."

DR. HANDSEL GRIFFITHS has been elected Corresponding Member of the Pharmaceutical Society of St. Petersburg.

DEATHS from small-pox declined in London last week from 97 to 75, of this latter number 31 were certified as unvaccinated, 22 as vaccinated, of the remaining 22 no information on this point was furnished.

A GUARDIAN of Borrisokane Union, has notified his intention of moving the cessation of the salaries of the sanitary officers of the union, on the ground that these officials have performed no duty since their appointment under the new Public Health Act.

THE following is the allotment of annuities for 1877 under the Bombay Medical Retiring Fund:—£252 to Surgeon-Major G. F. Forbes; £210 to Surgeon-General G. G. W. Maitland, F.R.C.S.L.; £210 to Surgeon-General T. B. Johnstone, M.D.; £168 to Deputy-Surgeon-General T. Murray.

AT Glasgow, a medical student has been arrested on a charge of manslaughter. It is alleged that some two months ago, while acting for a local practitioner in an Ayrshire village, he attended a young unmarried woman in her confinement, and that, in consequence of his unskilful treatment, she shortly after died.

In a case of tetanus which occurred in the Montreal General Hospital, Dr. Drake cut down upon the sciatic nerve and stretched it. The patient was then put upon chloral hydrate and calabar bean. The operation seemed at first to afford considerable relief to the patient, but after a time the spasms returned and he ultimately died of lockjaw.

THE *Yorkshire Post* mentions a proposal of Dr. Carr, a native of Leeds, well known in London as an eminent medical practitioner, to establish in perpetuity four free medical scholarship for educating as medical men foundation scholars of the Royal Medical Benevolent College, Epsom. The sum required is £7,000, of which £5,000 has already been contributed.

THE Lettsomian Lectures of the Medical Society of London, will be delivered by Alfred Wiltshire, M.D., M.R.C.P., Joint Lecturer on Midwifery and the Diseases of Women and Children at St. Mary's Hospital, on Monday, January 8th, 22nd, February 5th, 1877, at 8.30 p.m. Subject: "On Vascular Rhythm as Exemplified in Periodical Hæmorrhages, General and Local, and on the Treatment of Hæmorrhages from the Female Generative Organs."

THE Metropolis Asylums Managers held an extraordinary special meeting on Saturday in reference to the increase of the small-pox epidemic, and the necessity of providing further accommodation for patients. The week's return showed that although the managers had provided 881 beds for small-pox patients, they had been obliged to refuse nearly 200 other applications for admission during the week.

A MARYLAND newspaper reports a singular freak of nature on the Atlantic coast during the past week. Millions upon millions of dead fish of different kinds have been washed up from the sea, evidently victims to some epizooty, and lie rotting in the sun. In one place on Cobb's Island there is a strip of the beach two miles long and seventy-five feet wide covered with them to a depth of from three to six feet. Several large vessels are engaged in collecting and transporting them to the farmers of Accomac County, to be used for manure.

WE regret to hear that a case of yellow fever, terminating fatally, has occurred on board Her Majesty's ship *Aboukir* at Port Royal. There is good reason for the belief that the sanitary condition of the ship itself must be held responsible for this case. There was no illness from this cause on shore, according to the latest information, and the residents were fully of opinion that the fever had been bred on board the ship. She is in a very decayed condition, having been lying in the harbour for many years.

THE HARVEIAN SOCIETY OF LONDON—ANNUAL CONVERSAZIONE.

THE annual meeting of this Society was held on Thursday evening, the 4th inst., at its rooms in Titchborne Street. The report of the Treasurer showed the finances of the Society to be in a flourishing condition; while the report of the Council told of increased number of members and of papers read of a high order. The retiring President, Dr. Frederick Cock, read an address in which he alluded to the loss the Society had experienced by death during this last year. He then touched upon the legislation to regulate vivisection, to the course of medica study, where he spoke favourably of the almost extinct apprenticeships, and thought a larger element of tutorial teaching desirable; after which he reviewed the present position of the profession, and said that self-respect must ever command the respect of others. A vote of thanks was proposed by Mr. W. Adams, and seconded by Dr. Sedgewick; after which came the usual vote of thanks for the different office-bearers. There was a good attendance. The exhibition of pictures, in oil and water colours, and etchings by different medical artists, which has become quite a feature of the Harveian Society's *conversazione*, was more than usually interesting. It comprised contributions by Sir Henry Thompson, Dr. S. Buzzard, Blandford, Gilbert Smith, Messrs. Prescott Hewett, Seymour Haden, Propert, Lennox Browne, Eversley and Orrock. Some of these works were of high merit. Dr. Farquharson lent some paintings by well-known artists, and Dr. Reginald Thompson exhibited some new lustre ware of original design and novel material. Instruments were exhibited by Messrs. Khrone and Sesemann, Pratt, Arnold and Sons, and Meyer and Meltzer. Some beautiful microscopic slides were shown by Mr. Collins and Mr. Wheeler.

The following is the list of office-bearers for the ensuing year.

President.—T. Carr Jackson, F.R.C.S.

Vice-Presidents.—Thomas Morton, M.D., W. F. Teevan, F.R.C.S., E. B. Owen, F.R.C.S., Hughlings Jackson, M.D.

Treasurer.—Henry Power, F.R.C.S.

Hon. Secretaries.—H. E. Sewill, M.R.C.S.. J. Milner Fothergill, M.D.

Council.—John Easton, M.D., E. Symes Thompson, M.D., H. Cripps Lawrence, George Eastes, M.B., Robert Farquharson, M.D., F. Cock, M.D., J. S. Ramskill, M.D., Alfred Meadows, M.D., Percy Boulton, M.D., Stamford Felce, M.R.C.P., F. J. Gant, F.R.C.S., George P. Field, M.R.C.S.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

THE following address was presented by the President, Vice-President, and Council, to his Grace the Duke of Abercorn, on his departure from Ireland:—

May it please your Excellency,—We, the President, Vice-President, and Council of the Royal College of Surgeons in Ireland, having been apprised of your Grace's intention to resign the office of Viceroy of Ireland, beg leave to convey to your Excellency the expression of our deep regret, in common with every loyal subject in this part of her Majesty's realm, at the retirement from this high office of a resident Irish nobleman who, for the second time, had represented her Most Gracious Majesty with so much even-handed justice, dignified firmness, and signal benefit to this country. We cannot permit this opportunity to pass without expressing our high appreciation of the honour your Grace conferred on us by laying the foundation stone of the new library and museum buildings in connection with our college, and we beg to assure your Grace that no effort shall be wanting on our part to fulfil the prediction uttered by your Grace on that occasion—viz., 'That on laying the first stone of this noble building we are only inaugurating what will prove a larger sphere for those great and useful works for which the Royal College of Surgeons in Ireland has made itself so eminently remarkable.' In conclusion we devoutly trust that your Grace, your estimable Duchess, and every member of your Grace's noble family, may long and uninterruptedly enjoy the blessings of health and happiness, and the genuine respect of every loyal subject in this kingdom.—We have the honour to remain, with the greatest respect, your Grace's obedient servants,

GEORGE H. KIDD, President.
ROBERT M'DONNELL, Vice-President.
WILLIAM COLLES, Secretary.

His Excellency replied as follows:—

Mr. President, and Gentlemen of the Council of the Royal College of Surgeons in Ireland,—I most sincerely thank you for the very kind manner in which you have expressed your regret at my retirement for the second time from the Viceroyalty of Ireland, and it gives me the greatest possible satisfaction to think that my efforts to discharge the duties of that high office have been such as to be approved of by you. During my tenure of office I was especially happy to be able to testify in some slight manner my appreciation of the extent of usefulness of the Royal College of Surgeons in Ireland by being permitted the privilege of laying the foundation stone of your new buildings. In conclusion, I thank you warmly for your kind good wishes for the health and happiness of the Duchess and the rest of my family.

Correspondence.

THE DUBLIN ANTI-VIVISECTIONISTS AND THE MEDICAL PROFESSORS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I shall feel obliged by your giving insertion in your next issue to the follcwing correspondence.

Comment is quite unnecessary on the part of

Your obedient servant,

RAWDON MACNAMARA.

95 Stephen's Green, 4th January, 1877.

VIVISECTION.

TO THE EDITOR OF THE IRISH TIMES.

SIR,—From the correspondence which has lately appeared in several of the Dublin journals, I collect that the practice of vivisection, so far as the hospitals of that city are concerned, has been disclaimed and disavowed. This is certainly such an advance in public opinion as must rejoice every right-minded person. I sincerely trust these disclaimers and disavowals have been made authoritatively. I mean by the deliberate consent of the governing boards and medical staff of each hospital, and that we may now hope this change for the better will be, and will hold good, for all time to come. Still, it must be confessed, some mystery overhangs these utterances. And it is hard to account for this sudden change of front; for those who carefully watched the progress of the Vivisection Act through both houses of Parliament, studied the changes made and their reasons, noted the strong opposition made by vivisectors and their friends to particular clauses (an opposition before which Government eventually gave way), recollect that a certain clause empowering medical lecturers, on obtaining the necessary certificate and licence to teach their classes by demonstration—*i.e.*, vivisection of the living animal—was passed as indispensable. But we now find, in consequence of certain denials and statements, an impression abroad not only that vivisection in hospitals does not exist, but by implication should not exist and is not to exist. Are, then, the faculty suddenly converted? Can we lay such flattering unction to our souls? I fear not; for the debates of the Medical Council, of the Senate of the University of London, the speeches of the deputations to Government, the memorials of the different Royal Colleges, are all in print—not to mention the editorial articles and correspondence of the medical periodicals, &c., &c., all leading one to fear that the practice complained of is still a secretly cherished one.—Your obedient servant,

C. B. CALDWELL.

New Grange Lodge, Bray, Dec. 29, 1876.

TO THE EDITOR OF THE IRISH TIMES.

SIR,—As an ex-President of the Royal College of Surgeons in Ireland, as its representative on the General Council of Medical Education and Registration, as a professor in its schools, and as a surgeon to two important hospitals in this city, I feel myself in a measure coerced to take notice of a letter in your issue of the 1st inst., appearing over the signature C. B. Caldwell, in which, *totidem verbis*, a charge is brought against the governors of conniving at, and against the professional staff of practising, vivisection on the lower animals within the walls of our several hospitals in this city. This is a most serious charge, and one that at any time should not have been recklessly made, but advanced as it was at the very period of the year when the Hospital Sunday Collection was about to be made, on the very eve, I may say, of the day set apart for that purpose, the most convincing evidence should have been forthcoming to justify what otherwise I can but designate as a stab in the dark, given for what purpose I shall not here pause to inquire. Every hospital in this city has its board of governors, comprising in the aggregate the names of almost every citizen of note and standing, and representing almost every shade of religious and political opinion; through their hands every shilling of the hospital must pass, and are the public to be asked to believe that such gentlemen would sanction the misappropriation of one farthing of the hospital funds to assist in carrying on vivisection within their walls? In many cases these accounts are scrutinized by Government auditors. Is it seriously alleged that such officials would wink at such practices by passing accounts in which money was charged under the heading "Vivisection?" As to the distinguished medical and surgical gentlemen attached to these several institutions, their reputation for humanity is too well established to require vindication at my hands, and they can well afford to treat all such imputations with contemptuous silence; but it is not so with the sick poor. They must suffer if the springs of charity be poisoned at their very source. Their interests are at stake, and they must be the sufferers if such calumnious statements are permitted to go uncontradicted. Now, I hereby challenge any member of the Anti-Vivisection Society to bring forward one tittle of evidence in support of their charge that vivisection has been *ever* practised in any one of our Dublin hospitals. This is a question of veracity, not one that can be bolstered up by vague assertion. For more than a quarter of a century, as boy and man, I have been intimately acquainted with the inner life of most of our Dublin hospitals, and I never even heard of any one procedure which could give colour to such a charge. Largely engaged (as through all my medical life I have ever been) as a lecturer and teacher, had such occurred, perforce it would have reached my ears, and at this moment I can solemnly vouch for it that vivisection, as we now understand that term, is unknown to the authorities, and unpractised within the walls, of our Dublin hospitals. Should the Ant-vivisectionists fail in bringing forward evidence in support of their charge, or should they permit the judgment of the public to go by default in favour of our hospitals, and should any sick person lose his life in consequence of failing to gain admission into an hospital on account of crippled funds resulting from this most mischievous agitation, then I say that the parties who have made these unfounded charges will have been morally guilty of homicide. The duty of anti-vivisectionists clearly is to sift this matter to the bottom, and if they find that their charges are as false as they are mischievous (which I most confidently assure you, and, through you, the public generally will be the result), then equally will it be their duty to go from door to door soliciting subscriptions, not for their own society, but for the Hospital Sunday Fund, and thus recoup valuable institutions, true temples of charity, at present suffering from a pseudo-humanitarianism strongly savouring (to take the mildest view of their conduct) of the knight errantry of Don Quixote.

I apologise not to you, sir, for the length of this letter. Great interests are at stake, and if there be one thing more than another of which we Irish should be proud, or of the reputation of which we should be more jealous, it is the fair fame of our schools of clinical medicine and surgery; besides which I know well that you can justly boast with Terence of old "nil humani mihi alienum puto."

Your obedient servant,

RAWDON MACNAMARA.

Surgeon to the Meath Hospital, and to the Westmoreland Lock Hospital, &c.

95 Stephen's Green, 2nd January, 1877.

THE EMPRESS OF INDIA.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The notification of her Majesty, as Empress of India, has been carried out by the Viceroy, at Delhi, in all its pomp and grandeur, and orders bestowed on native princes and English officers and civilians. I observe only one medical man decorated. To whom are we, as a nation, originally indebted for our grand power and possessions in India, *but the medical profession.*

In the year 1636, Shah Tehan's daughter was successfully treated of sickness by Surgeon Boughton, and when the Emperor would have overwhelmed him with wealth contented himself by soliciting further advantages for his countrymen.

In the year 1715, Surgeon Hamilton, of the E. I. Company's service, having cured Farakshur, Ninth Mogul Emperor, obtained from him the important concessions which the E. I. Company were *then earnestly seeking*, and thereon, Calcutta was declared a separate presidency. Observe what important power for the E.I.C. was gained by two honourable members of the medical profession, and its results now declaring H.M. the Queen, Empress of India. I should like to know if any relatives of these noble surgeons are holding any position in India? If so, should they not have the "Star of India" conferred on them in respect and honour of their ancestors; or

is the profession of surgery and medicine to remain silent in its brilliancy, and merely made a handle of for others as usual.

Yours truly,

J. M'GRIGOR CROFT, M.D., M.R.C.P. Lond.,
Late Staff Surgeon to H.M.'s Forces.

London, Jan. 3, 1876.

Medical News.

Vital Statistics.—From the Registrar-General's reports we learn that during last week 4,894 births and 3,668 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 1,226. The mortality from all causes was at the average rate of 24 deaths annually in every 1,000 persons living. The annual death-rate was 22 per 1,000 in Edinburgh, 23 in London, 28 in Dublin, and 27 in Glasgow. In the other large towns the rates were—Plymouth 20, Portsmouth 18, Nottingham 18, Sheffield 22, Bristol 19, Leicester 27, Norwich 21, Brighton 22, Sunderland 33, Birmingham 19, Leeds 27, Wolverhampton 22, Hull 18, Oldham 31, Manchester 28, Salford 28, Bradford 24, Liverpool 30, and Newcastle-upon-Tyne 28. The annual death-rate from the seven principal zymotic diseases averaged 3·3 per 1,000 in these towns. and ranged from 0·6 in Nottingham, to 5·3 and 8·3 in Sunderland and Salford. The deaths referred to small-pox in these towns were 104, against 78, 100, and 125 in the three preceding weeks; 75 occurred in London, 16 in Liverpool, 8 in Manchester, 5 in Salford, and not one in any of the other large towns.

The Norfolk and Norwich Hospital. — Some few weeks ago we mentioned that his Royal Highness the Prince of Wales attended a meeting at Norwich to raise funds for an extension of the Norfolk and Norwich Hospital. The appeal then made to the local public, with the aid of the Prince, has been eminently successful, subscriptions having been received to the amount of £22,942. This sum having exceeded the sum asked, the extension will probably assume a wider range; in fact, the entire rebuilding of the hospital has been proposed. In addition to the £22,942 subscribed, the Earl of Leicester, Lord-Lieutenant of Norfolk, has also offered £13,000 as an endowment fund.

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader," "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

USEFUL EVEN IN DEATH.—A California paper states that a San Francisco firm buys, at forty cents each, all the dogs which die or are killed in that city. At their manufactory the skins of the dogs are removed and sold to the tanneries; the hair is taken off and sold to the plasterers; the hide tanned, made into gloves, and sold in the market. The denuded carcass is thrown into a huge cauldron and boiled until the bones are easily separated from the flesh, when they are removed and sold to the sugar refineries, where they are ground to a fine powder and used to clarify sugar. The oil that rises to the surface of the boiling mass is skimmed off and made into *cod-liver oil*, and the remainder is used for fattening hogs.

F.R.C.S.—It is an American book published some five or six years ago by Messrs. Wood, of New York. Doubtless you could get copies in London.

WALKING THE HOSPITALS.—One of the comic papers contained a very good joke last week, albeit at the expense of young aspirants to professional honours. An uncle with his daughter are represented meeting in the streets of London two medical students habited in the height of fashion. The uncle puts the not unusual question to the men (his nephews): "Well, boys, what are you doing now?"—*Reply:* "Well, Uncle, we are walking Thomas's."—*Fair Cousin:* "Oh! I thought you were walking Guy's!"

MR. FRANCIS MASON writes that, in our review of Mr. Bryant's work on "Surgery," we have by mistake given to him, instead of Mr. Moon, the credit of having written the section relating to dental surgery.

THE Dublin Obstetrical Society will meet on Saturday next at 8 o'clock at the College of Physicians, when the following communications are set down for reading: Dr. Purefoy, on a "Case of Extra-Uterine Fœtation—Escape of Fœtal Bones per vaginam—Recovery." Dr. Macan, on "Amputation of the Uterus in a case of Chronic Inversion." Dr. Boyd, on a "Large Tumour Removed from the Vulva."

THE Cork Medical and Surgical Society will meet this evening at 8 o'clock, when the following communications are set down for reading: Dr. R. Atkins, on "Intra-pericardial Aortic Aneurism" (path. spec.) Dr. O'Keeffe, on "Hypertrophy of Spleen." Dr. Atkins, on a "Case of Suicidal Hanging."

COMMUNICATIONS, Enclosures, &c., have been received from—Dr. Carey, Taunton. Mr. Haviland, Northampton. Dr. Satchell, Tunbridge Wells. Mr. Roots, Kingston-on-Thames. Dr. Symonds, Ormskirk. Dr. Pearce, London. Mr. Parkinson, Burnley. Dr. Routh London. Dr. Priestley, London. Mr. T. Lowther Matthews, Manchester. Dr. Ormsby, Dublin. Mr. Hay, Hull. Mr. Lane, Kirton. Dr. O'Neill, Lincoln. Dr. McGrigor Croft, St. John's Wood. Dr. Greene, London. Mr. Jolliffe Tufnell, Dublin. Dr. Beatty, Dublin Dr. Martin, Sheffield. The Registrar-General. Dr Tabuteau. Portarlington. Dr. May, Rathfriland. Dr. Kraus, Vienna. Dr. Weddich Dublin. Dr. Wrightson, Halesworth. Dr. Bennett, Clonakily, &c., &c.

VACANCIES.

Middlesex Third County Lunatic Asylum, Banstead.—Three Assistant Medical Officers. The salaries attached are—£200, £150, and £120, advancing to £250, £200, and £150 respectively, each with apartments and board. Forms of application may be had of the Clerk. (See Advt.)

County of Louth Infirmary.—House Surgeon. Full particulars as to salary, &c., to be obtained of the Secretary, Louth Infirmary, Dundee. (See Advt.)

Cambridge, Addenbrooke's Hospital.—House Physician. Salary, £65, with board and lodging. Also a Dispenser. Salary, £100, with dinner daily. Applications to the Secretary.

Tunbridge Wells Dispensary.—House Surgeon and Secretary. Salary £100, with board and lodging. Address the Secretary.

Cheltenham Union.—Medical Officer. Salary, £60, with extra fees. Apply to Mr. R. Ticehurst, Essex Place, Cheltenham.

St. Giles's and St. George's, Bloomsbury.—Dispenser for the united Parishes. Salary, £100, with apartments and rations. Applications to the Clerk of the Guardians, 57 Broad Street, W.C.

Chelsea.—Assistant Medical Officer. Salary, £100, with apartments and rations. Applications to the Medical Superintendent, Arthur Street, Chelsea, S.W.

East Riding Lunatic Asylum.—Medical Superintendent. Salary £350, with furnished house. Applications to the Clerk to the Committee of Visitors, Beverley.

St. Mary's Hospital, Manchester.—House Surgeon. Salary, £80, with board and residence. Address the Secretary, 41 John Dalton Street Manchester.

Newcastle-on-Tyne Dispensary.—Resident Medical Officer. Salary £200, with residence. Address the Hon. Sec., Grange Street, West Newcastle.

Marriages.

ANDREW—HAIGH.—On the 4th inst., at St. Mary's Church, Scarboro' James Andrew, M.D., F.R.C.S.Ed., to Fanny, daughter of the late John Haigh, J.P. for the West Riding of Yorks.

DUNCAN—MOTHERELL.—On the 2nd inst., at Belfast, Thomas Duncan M.D., Fintona, co. Tyrone, to Mary Elizabeth, only daughter of the late John Motherell, M.D., Castlederg.

GOWAN—EVANS.—On the 4th inst., at Holy Trinity, Ulley, Charles Gowan, M.D. Edin., of Anston, Yorks, to Francis Mary Alice daughter of the Rev. W. S. Evans, Vicar of Ulley, Rotherham.

PARSONS—DOLMAN.—On the 2nd inst., at the Parish Church, Dawlish Arthur Daniel Parsons, L.R.C.P., of Dawlish, to Susan Charlotte eldest daughter of Frederick Dolman, of The Bartons.

Deaths.

BECK.—On Jan. 6, at his residence, 7 Portland Place, London, Thos Snow Beck, M.D., F.R.S., aged 63.

CALTHROP.—On Jan. 3, at Louth, suddenly, Louisa Jane, widow of W. C. Calthrop, M.R.C.S., Withern, Lincolnshire.

CASS.—On Dec. 24, at Bridlington, William Reader Cass, F.R.C.S.E. aged 72.

JAMES.—On Dec. 21, at Secunderabad, Henry Northage Laud James M.D., aged 32.

LELAND.—On Dec. 30, at Brough, Westmoreland, J. S. Leland L.R.C.P.Ed., L.R.C.S., &c., aged 31.

MURPHY.—On Jan. 4, at 3 Nottingham Place, London, W., E. W. Murphy, M.D., A.M., late Professor of Midwifery in University College, aged 74.

IRISH POOR-LAW INTELLIGENCE.

REPORT OF THE COMMITTEE OF COUNCIL OF THE IRISH MEDICAL ASSOCIATION.

During the Quarter ended 20th December, 1876, submitted to the Quarterly Meeting of Council, Dr. JACOB *in the chair.*

Mr. CHAIRMAN and GENTLEMEN,—Since last meeting of the full Council the Committee have held ten meetings, and in accordance with your instructions:—

1. The last Quarterly Report has been printed and circulated amongst the members of the Association.

2. The Solicitor to the Association has received instructions to take the steps necessary with a view to incorporation of this Association, as a corporate body, under Act of Parliament.

3. A copy of your resolution, acknowledging receipt of the late Sir William Wilde's bequest to the Association has been forwarded to Lady Wilde.

4. The Committee have appointed Dr. Chaplin, of Kildare, ex-President of the Association, and Dr. Morrogh, late member of the Council, Auditors for the current year.

5. The Committee have appointed Mr. Clifford Lloyd, of 22 Lower Leeson Street, Dublin, Solicitor to the Association.

6. Dr. Woods, of Monaghan, was informed that the Council was desirous of rendering him every assistance in its power concerning the case still pending of "Woods *v.* Crumley."

CORONERS' MEDICAL WITNESSES IN DUBLIN.

7. A case was duly prepared by Mr. Lloyd, and submitted to Mr. Purcell, Q.C., for his opinion as to the legality of almost exclusively employing the same medical witness at all coroners' inquests; as to the legality of payment of such medical witness by fixed salary, and as to what course should be adopted with a view to the prevention of same. Mr. Purcell's opinion was to the effect that—inasmuch as the "presentments" now about to be made by the Corporation for such expenses, were for those of the ensuing year, not the past one—he considered it advisable to oppose the fiating of the presentments, as the fiating judge would hardly assume that the Corporation would improperly disburse the sums presented for; but that when the Corporation accounts for the past year were being audited, such audit might be successfully opposed. Mr. Purcell is of opinion that the employment by the Coroner of the same medical practitioner at all inquests is a violation of the spirit and intention of the Act of Parliament, which to his view directs that the medical witness should be a registered practitioner, residing in the immediate locality of the place of death; and that the payment of a medical witness by salary, instead of by fees per inquest, is illegal. The Committee accordingly instructed Mr. Lloyd to oppose the au lit, which it is expected will take place early in the coming year.

NEW MEMBERS.

When sending out the last quarterly report, the Committee availed themselves of the opportunity of bringing the Association under the notice of all the eligible non-members in Ireland, by forwarding to each a copy of that report, and a résume of the changes likely to be effected in the Registration of Births and Deaths, by the expected adoption by Parliament of the new Bill drawn up by this Council, which has been introduced by the Right Hon. the Earl of Donoughmore, and printed by order of Parliament; together with a circular letter. The result of this circular is that fifty-three new members have been added to the Association, but the Committee regret to have to report that there are still a great many eligibles who, though doubtless ready and willing to avail themselves of all the advantages accruing to them as the result of the labours of this Association, have not shown the gratitude, or even mere self-consideration, which might fairly be expected of them by supporting it, and so enabling the Association to obtain greater advantages. A *black list*, containing the names of all eligible non-members has been made out by the Hon. Secretary.

The vacant Consulting Sanitary Officership at Cafrickmacross has not as yet been filled in consequence of the guardians of that union not having, up too the present time, offered such remuneration as would be accepted by any of the medical practitioners resident in the neighbourhood.

PAYMENTS TO CIVIL PRACTITIONERS FOR MILITARY SERVICE.

The subject of payment of Civil Medical Practitioners in charge of Troops in Ireland received the earnest attention of the Committee, who had the advantage of the assistance of several members holding such appointments, when it was decided that the insufficient rate of remuneration at present allowed, should be brought under the notice of the Director-General of the Army Medical Department, to whom the Hon. Secretary, by direction of the Committee, addressed a letter and in reply was informed that the subject was under the consideration of the Under Secretary of State for War.

Dr. Sharkey, of Ballinasloe, has accepted the seat on this Council to which you appointed him in room of Dr. Kerans, late of Ahascragh, resigned.

FEES TO MEDICAL WITNESSES AT SESSIONS.

The subject of fees allowed to medical witnesses for their attendance and evidence at Sessions Courts, so frequently complained of, received the attention of the Committee, who instructed the Hon. Secretary to write to the Attorney-General, and state, that under Rule 19 of "The Rules for

Crown Solicitors and Sessional Crown Solicitors," re-issued 1st October 1868, and still in force, the services of medical witnesses at such courts were depreciated, and insufficiently remunerated, whilst the social status of the medical profession was not acknowledged, and to request that the Attorney-General would have the goodness to appoint a day to receive a deputation from this Association to confer with him on the subject. In reply, the Attorney-General appointed the 9th December to receive the deputation, when a memorial was presented to him, and after discussion, the Attorney-General, who received the deputation very kindly, stated that the suggestion made should receive his best attention.

The memorial presented by the deputation was published at page 3 of the Supplement to our last issue.

Certifying Surgeons.

Several communications from members having been received referring to the report of the Commissioners appointed by Parliament to investigate and report on the state of the Factory laws, wherein the interests of the certifying factory surgeons were involved, and requesting this Council to take such action in the matter as appeared to them right, the committee instructed the hon. secretary to communicate with the President and Secretary of the Association of Certifying Factory Surgeons, as well as with such certifying factory surgeons as are members of this Association, with a view to eliciting suggestions and information upon which this Council might take action; the result of which is that the committee consider that the interests of the certifying factory surgeons should be supported, and that when the matter was brought before Parliament, a petition should be forwarded advocating their cause.

Vaccination.

The Committee have devoted considerable time and attention to the existing laws relating to public vaccination in Ireland, and being of opinion that alterations were necessary, deputed Drs. Speedy and Pollock to investigate the subject, and report upon the defects of the existing enactments, and at the same time suggest such modifications as they considered advisable. Drs. Speedy and Pollock having submitted their report in the form of a new bill to consolidate and amend such Acts of Parliament, which the Committee having carefully examined and approved of; it was ordered that the bill be printed, and then again submitted for reconsideration; this having been done, the Committee made such alterations as to them appeared advisable, and the bill is now ready for presentation to the Chief Secretary for Ireland, whose adoption of it as a Government measure the Committee hope for. The alterations in the existing laws regarding public vaccination in Ireland as recommended in this bill are assimilation as far as possible and desirable, of the law in Ireland to that in force in England; but as the Committee have reason to believe that the mileage allowances now paid for in England would not be acceptable, they have suggested as an equivalent that a uniform fee of two shillings and sixpence should in future be paid to each public vaccinator in Ireland for each case of successful vaccination performed by them, instead of the fee of one shilling at present only allowed. The Committee being further of opinion that perfect vaccination in each case is as essential as universal vaccination, have adopted the system at present in operation in England, and have suggested that the English "award system" be extended to Ireland, whereby public vaccinators are granted a gratuity which is often very substantial in amount, for vaccinations approved of by the inspectors, who, as a rule, it is believed, judge by the cicatrices resulting from the vaccinations performed, as well as from observation of the vaccinations in their various stages. Universal and perfect vaccination is a matter of great importance not only to the public, but to the state, and can best be provided by proper remuneration, consequently the Committee hope and expect that the new bill will be favourably received by the Chief Secretary and adopted as a Government measure; but should their expectations not be realised, the Committee will seek the introduction of the bill by a private member of Parliament.

Workhouse Medical Officers.

The Committee have also had under their consideration the subject of the grievances of workhouse medical officers under existing regulations, which was referred to in the last quarterly report, and have directed that a letter to the authorities should be forwarded setting forth the complaints and suggesting remedies, the draft of which is to be submitted to next meeting of the Committee, when, after due consideration, it shall be forwarded forthwith. The Committee are of opinion that an epistolary communication will prove sufficient in this matter without organising a deputation.

The appeal case of "Woods *v.* Crumley," noticed in last quarterly report was tried before the Chairman of Quarter Sessions, who stated "that he was for Dr. Woods on all the points in the case of fraud against Crumley, but that he was obliged to non-suit him beacuse the action had not been taken within three months of the committal of the fraud," against which decision Dr. Woods further appealed.

Superannuation.

The Committee have also had under their consideration the important subject of Superannuation of Poor-law Medical Officers, and with a view to promoting this object have drawn up a letter which it is proposed should be addressed to the Chairman of each Board of Guardians in Ireland, requesting that he would bring the matter under the notice of the guardians of which he was chairman, and obtain their authority to add his name as their representative to the memorial, a copy of which will be enclosed, wherein the Council of this Association pray that Parliament will see fit to pay half the expenses of such superannuation allowances in the same manner as half of the salaries of the medical officers in office are at present paid.

The circular referred to points out that the present is a fitting time to seek such assistance from Parliament, the recipients of superannuation being but few, whilst the prayer, if granted, would diminish by one-half the expenditure in this matter required from the poor's rate, and not require any great outlay of public money. The draft of this circular has been sent to the printer to set up, and the memorial referred to shall be drawn up at next meeting of the Committee. If the Board of Guardians throughout the country support the memorial its prayer will probably be granted by Parliament, and the result will be that Boards of Guardians will doubtless be more considerate in allowing superannuation when the rates will be charged with only half the amount granted by them. The committee consider this an important step towards obtaining compulsory superannuation.

A letter was received from the late Dr. Scully, jun., of Clonmel, to the effect that the Co. Tipperary Medical Association had ceased to exist as a Medico-Political Association.

The Committee, with deep regret, have to announce the deaths of Drs. Nason, Forsayeth, and Scully, jun.

The Hon. Sec. to the so-called Anti-Vivisection Society lately issued a circular to the members of the medical profession in Ireland which was of a very objectionable and offensive character, which has doubtless been treated with the contempt it deserved.

FEES FOR CERTIFYING DANGEROUS LUNATICS IN IRELAND.

MR. BROWNE, the auditor of the L. G. B., in the course of his audit of the Boyle union accounts for the half year made the following note :—

"A sum of £1 1s. appears to have been paid to Dr. J. B. Drapes for attendance at Petty Sessions, in the prosecution of defaulters under the Compulsory Vaccination Act. Sec 13 of that Act provides, as regards expenses incurred in such proceedings, that, if the justice or justices before whom such proceedings are held certify that such expenses ought to be allowed, such justice or justices shall ascertain the amount thereof and such amount shall be payable out of the poor-rates of the union in which the default or neglect shall have arisen. In the present case as I am informed, the magistrates declined to certify for any expense, the medical officer having merely to walk across the road from his house to the court, he consequently was not entitled to any remuneration. I have been also informed by some of the guardians present at the meeting of the board of guardians held on the 12th inst., that the chairman of quarter sessions stated in the case of civil bill process brought against the guardians by another medical officer of the union, that a certficate of the nature referred to was not necessary. Under these circumstances I reserve to myself the right to disallow the payment above referred to, should the Local Government Board, on the matter being brought before them, agree with me that the medical officer was not entitled to any remuneration for his service in the absence of a certificate from the magistrates.

In all other respects these accounts are correct.

"EDWARD J. BROWNE.

"Dated 13th Dec., 1876."

The auditor seems to have been under a misapprehension. The Boyle Guardians were sued under the 13th section of the Vaccination Amendment Act, for the attendance of their medical officer to give evidence at vaccination prosecutions, and not for the certifying of a lunatic. II. In the case of vaccination prosecutions, it is the Guardians who retain the services of the medical officer as witness, and it was ruled by the chairman of quarter sessions that with or without a justices' certificate, the guardians if they formally require the witness's attendance, are liable for a fee as a matter of simple contract, and also that the word "expenses" includes a doctor's fee for his testimony, even if he had not to leave his own study. In the case of lunacy certificates the matter is different. In it the justices, not the guardians, are the persons who summon the medical officer under the authority of the 14th section of the Lunacy Amendment Act (see Irish Med. Directory for 1876, page 471), and by that section they are distinctly empowered to give or refuse a certificate for a fee at their uncontrolled discretion. The guardians are not empowered to pay except in such certificates, and the medical officer must run the risk of being done out of his fee. It seems evident that he cannot legally refuse to attend. The requisition for the doctor's attendance is issued under the authority of the Dangerous Lunatics Act, 30 and 31 Vict., cap. 118, section 10 (see I. M. D. for 1876, page 468). The clause says :—

"Whenever any person shall be brought before any two justices and it shall be proved to their satisfaction that such person was discovered and apprehended under circumstances denoting a derangement of mind . . . the said justices shall call to their assistance . . . the nearest available medical officer of the dispensary District in which they shall be at the time, . . . who shall examine such person *without fee or reward.*"

This clause was amended by the 14th section of the Lunacy Regulation Act, 38 and 39 Vict., cap. 67 (see I. M. D., 1876, page 471), which says :—

"Notwithstanding anything in 30 and 31 Vict., cap 118, sec. 10, it shall be lawful for any two justices causing any person to be examined by any medical officer *as therein mentioned*, if they think fit so to do, to make an order under their hands and seals upon the guardians of the union to which such person belongs, tor the reasonable remuneration to such medical officer and for the payment of all other reasonable expenses in or about the examination of such person, not exceeding in the whole the sum of two pounds."

These sections it will be seen, empower the justices to "call to their assistance" the medical man, and—if he attends—to refuse him his fee; but need he attend? His duties as set down in article 21, of the Dispensary Regulations (I. M. D., 1876, page 233), make no reference at all to lunacy certifying. The 15th section of the Medical Charities Act (14 and 15 Vict., cap. 68.—I. M. D., page 464), seems, however, decisive against the medical officer on this point, for it says :—

"It shall be the duty of any salaried medical officer of dispensary district under the act, . . . without any further fee or reward, to examine and certify under the statute in that behalf as to the case of any dangerous lunatic brought before a justice of the peace, within his respective district, when summoned by such justice so to do."

This clause has not been embodied in the 21st article of the Dispensary Regulations, but it is none the less binding, and the Local Government Board might make a rule enforcing the medical officer's attendance if they saw fit.

QUARTERLY RETURNS—*Continued.*

THAT this decline in the fatality of controllable diseases is due, in part, to improvements in the sanitary state of various districts, is fully shown by the remarks contained in the notes furnished by the respective registrars. This being so, it is to be regretted that so much still remains undone, and that the registrars of many districts feel it their duty to animadvert on the utter neglect of the simplest hygienic laws.

Bad drainage, imperfect water supply, overcrowding, piling of manure in proximity to dwelling-houses, and refusal to isolate those suffering from infectious disease—these are the evils to one or other of which the origin or the propagation of zymotic diseases can, in most cases, be clearly traced, and for which the people, and, it would appear, in too many instances, the local authorities, are responsible.

The Registrar of Kells District, in which 10 of the 38 deaths registered were caused by scarlatina, says:—"The fatal cases, as usual in every epidemic, all occurred in the overcrowded, ill-ventilated cabins with which the district abounds."

The Registrar of No. 4 Cork City District observes:—"Several cases of typhus fever occurred at Kerry Pike during the past quarter. The sanitary condition of this little village is in a deplorable state. The houses are small, badly ventilated and lighted, (some of them with perforated roofs inclined to topple down,) carefully flanked front and rear, with dung-heaps and cesspools."

"I regret to write," reports the Registrar of Annacarriga District, Scarriff Union, "that typhoid, and more recently typhus, have appeared here. . . . .Manure in the yards and pigs in the houses are the two great enemies to sanitation. . . . .Toere is an open sewer, which I am sure has done harm; but the Sanitary Authority at Scarriff refused to have it remedied, as I suggested."

ON THE ELECTRO-MOTIVE PROPERTIES OF MUSCLE. (a)

By J. Burdon-Sanderson, M.D., F.R.S.

In the great work entitled "Untersuchungen über thierische Electricität,' of which the first volume was published by Professor Dubois Reymond, in 1848, the author promulgated as the results of the remarkable investigations undertaken by him during the previous six years, certain propositions relating to the electro-motive properties of muscle. These propositions (which in the original work were printed in large large type and double leaded) were termed by the author collectively the "Law of the muscle-current." They have been accepted by all later observers as fundamental truths. They are as follows :—

THE LAW OF THE MUSCLE-CURRENT.

I. Active Disposition.

A. *Strong Currents.*

If any point of the natural or artificial longitudinal section of a muscle is brought into connection with any point of the natural or artificial transverse section of the same muscle, so that no tension is thereby produced, a circuit is indicated by any galvanoscopic apparatus introduced into the inactive conducting current, of which the direction in the circuit is from the longitudinal to the transverse section.

B. *Weak Currents.*

a. *Currents of the transverse section.*—Further, if any point of a natural or artificial transverse of a muscle is connected in the manner already described with another point of the same transvere section, or with a point of another natural or artificial transverse section of the same muscle, which we will regard as a cylinder, and if points are at unequal distances from the centre of the circular area of the transverse sections, the galvanoscopic apparatus again indicates a current, though much weaker than the previous one, of which the direction is from the point more distant from the centre to the nearest point.

b. *Currents of the longitudinal section.*—Thirdly, if a point of the natural or artificial longitudinal section, lying nearer to the geometrically central transverse section of the cylinder formed by the muscle, is brought in the same way into relation with a point of the natural or artificial longitudinal section of the same muscle more distant from the central transverse section, the galvanoscopic apparatus again indicates a current, which is, however, much weaker than that between any point of the natural or artificial longitudinal and any point on the transverse section, but is equal in strength to that between different points on one or two natural or artificial transverse sections. Its direction in the circuit is from the point lying nearer to the middle transverse section to that further removed from it.

II. Inactive Dispositions.

The galvanoscopic apparatus, on the contrary, remains at rest when two points in one, or two natural or artificial transverse sections connected through the inactive conducting circuit are at an equal distance from the centre ; or in the natural or artificial longitudinal section are at an equal distance from the central transverse section.

The purpose of the present note is to put on record observations which prove

( ) That the unmutilated muscle possesses electro-motive properties which have not before been correctly described ;

(2) That in the "muscle-cylinder" of Dubois Reymond, the electro-motive phenomena are dependent on and determined by those of the muscle, and exhibit electrical properties which, in many important respects, are inconsistent with the "law" of Dubois ;

(3) That the electrical change consequent on excitation, and termed by Dubois "negative variation," in like manner possesses characters entirely different from those assigned to it by him ;

(a) Read before the Royal Society.

(4) That it is not true, as averred by Professor Hermann, of Zurich, that the electrical state of muscle becomes negative during contraction as compared with muscle at rest, but on the contrary, that the contracting parts become positive.

The following statements refer exclusively to the gastrocnemius muscle of the frog, which has been selected as the muscle most suitable for investigation, and as having been chiefly employed by Professor Dubois Reymond.

1. When one terminal of the Lippmann's capillary electro-meter (described in the preceding paper by Mr. Page and myself) is connected by a suitable electrode (to be called the fixed electrode) with the surface of the back of a previously decapitated and pithed frog, and the other (the movable electrode) with the surface of the gastrocnemius muscle at a distance of from two to five millimetres, from the upper end, it is found that the position of the mercurial column is nearly unaltered, indicating that there is no, or only a slight, difference of potential between the two surfaces thus compared. If the potential of the surface of the muscle be positive, the neutral point can be found by shifting the electrode further down; if negative, by shifting it further up.

2. If now the movable electrode is gradually shoved down the surface of the muscle without breaking contact, the mercury alters its position so as to indicate greater and greater negativity of the muscular surface, until at last a point is reached near the tendon beyond which the surface again become positive, the positivity increasing as the tendon is approached.

3. If, the fixed contact remaining unaltered, the points already investigated are compared with other parts of the muscle, it is found that, as a rule (*a*), any two points equidistant from the origin of the muscle exhibit the same potential, and (*b*) that the ends of the muscle exhibit potentials which are identical with the potentials of the inactive tissues (*e.g.*, subcutaneous cellular tissue, bone, &c.), in the neighbourhood, this being true both as regards the insertion (tendon) and the origin of the muscle.

4. If the tendon is divided and the muscle remaining attached by its origin is separated from its other connections, so that it is out of contact with surrounding tissues, and in this state is re-investigated, it is found that the negativity increases from its origin towards the negative point, and diminishes from that point towards the tendon in the same way as before, the only change observable being that the absolute difference of potential between that spot and the fixed contact is greater than before, *i.e.*, that all the other less differences are proportionally exaggerated.

5. If the muscle is thrown into tetanic contraction by faradisation of the sciatic nerve for a period of two seconds' duration, the excitation is accompanied by an excursion of which the direction is positive, and which attains its maximum during the second half of the period during which the excitation lasted, beginning to decline immediately after its cessation. The extent of the excursion is such as to indicate that the electro-motive force of the muscular tissue diminishes by about a third. This phenomenon is observed before as well as after separation of the muscle from its connections.

6. If now the muscle is severed in its upper third by a cut transverse to its axis, and again in the region of greatest negativity by a second cross cut, a muscle-cylinder is obtained having the following properties, viz. :—

(1) The *upper*-cut surface is negative to the natural surface in its neighbourhood, but positive to the more distant parts. Between these parts an intermediate zone may manifestly be found where the tension of the natural surface is equal to that of the upper-cut surface.

(2) As compared with any point of the natural surface in this zone the lower-cut surface is strongly negative; any point of the natural surface nearer the lower-cut surface is negative, its negativity increasing with its distance from the zone; and in like manner any point nearer the upper-cut surface is positive, the more so the further it is from the zone.

Frog 4: Gastr. r.	3·4	1·5	−1·7	−0·8	1·5	3·7	2·0	3·4	0·0	0	−2·3	−2·3
" l.	3·4	1·4	−3·6	−1·5	0·9	4·9	2·5	3·4	0·0	0		

(3) When the muscle-cylinder is thrown into contraction by contact with the platinum wires in connection with the ends of the secondary coil of a Dubois's induction apparatus, excitatory variations are observed, having the following characters :—*a*. If one terminal of the electrometer is in connection with the natural surface at a point equidistant from both ends (Dubois's equator), and the other with the upper-cut surface, the position of the mercurial column indicates that the cut surface is negative to the natural surface, *i.e.*, the former to the latter. On excitation the difference of tension between the two increases, *i.e.*, in Dubois's language, a *positive* variation occurs. *b*. If the same part of the natural surface is now compared with the lower-cut surface, and the excitation repeated, the difference of tension between the two is found to be in the same direction as in the former case, but much greater. On excitation it diminishes, *i.e.*, in Dubois's language, a *negative* variation occurs.

7. From the foregoing facts as to the muscle-cylinder prepared in the manner directed, it appears that it possesses properties entirely inconsistent with the "law of the muscle-current" in the following respects :—

(1) That the electrical tension of the upper- and lower-cut surfaces, instead of being identical, differ widely;

TABLE II.—*Showing the Electro-motive Properties of Muscle-cylinders, cut from the Eight Muscles in Table* I.

Muscle.	Distance of lower-cut surface from tendon.	Length of cylinder.	Distance of point F from lower-cut surface.	Potentials of undermentioned points compared with F=0·0			
				Most positive point of natural surface.	Most negative point of natural surface.	Centre of lower-cut surface.

" l	1·2	1·7	0·8	+4·5	0·0	−3·3
Frog 2: Gastr. r	1·4	1·5	0·85	+2·6	−3·4	−4·8
" l	1·6	1·4	0·0	+2·5	−1·0	−3·4
Frog 3: Gastr. r	1·5	1·5	0·8	+0·8	−4·1	−4·8
" l	1·2	1·4	0·5	+1·8	−1·5	−4·0
Frog 4: Gastr. r	1·2	1·6	0·0	+1·4	0·0	−2·9
" l	1·2	1·6	0·0	+0·0	0·0	−2·9

(2) That the equatorial zone of the natural surface presents none of the properties assigned to it by the "law;"

(3) That the excitatory variation is also opposed to the "law."

8. On the ground of these experiments I conclude, that in the gastrocnemius of the frog, and in all the other muscles of the limbs that I have investigated, the part nearest the tendon is (in the natural state) negative to the others, and that the distribution of electrical tension on the natural surface is governed by a law which is constant for each muscle, and therefore, no doubt, dependent on its structure. And I claim to have shown that the phenomenon hitherto known to physiologists as the "negative variation" cannot be described as "diminution of a previously existing current" between cut and natural surface, but may, in all its phases be completely explained as a temporary diminution of the electro-motive force of those parts of the muscles which are in the natural state negative, as compared with the electrically inactive tissues of the body of the animal; and as a direct consequence of this that the excitatory variation of animal muscle is opposed in sign to that of the excito-contractile tissue of *Dionæa*.

9. This being understood, all that is observed in the muscle-cylinder can be explained as resulting from the properties exhibited by the muscle itself before its mutilation, so that it is not only true that the general properties of the cylinder can be deduced from those of the muscle as a whole, but that (as the Tables show) the special peculiarities of each particular case may be accurately foretold if the whole organ has before been investigated.

THE SUBCUTANEOUS AND OTHER METHODS OF DIVIDING STRICTURES OF THE URETHRA. (*a*)

By HENRY DICK, M D.,
Late Surgeon to the National Orthopædic Hospital.

FROM the title of my paper do not expect a long introduction on the pathology of strictures of the urethra, or the description of the different forms and their treatment. I will only touch upon the practical points and controversies of cutting strictures. Days and weeks would not be sufficient to discuss the actual state of the surgery of urethral stricture, and this meeting of a few hours' duration, shall only be practically occupied on the operation of cutting strictures, and what is, in my opinion, the best method of cutting them.

Do not believe when I speak of operations upon strictures, that I am a great partisan of cutting them. As I have stated years ago in all my writings, that the division of strictures should be in most cases the exceptional treatment. The best and safest treatment, according to my experience, is the methodical and gradual dilatation by the metallic urethral bougie; each metallic bougie remaining about five minutes, and passing, as the case may be, one or two or even three to four sizes at one visit; of course, with caution to avoid accidents, such as orchitis, which in cases where the stricture is near the prostate gland, and is in an irritable state, or very contracted, the bougie is liable to produce. I use the expression metallic *urethral* bougie, because such bougie should imitate the anatomical shape of the urethra. In all our books very little difference is made between the urethral bougie and the bougie used for other purposes in disease of the bladder and prostate gland. Its length should be so constructed that it does not go beyond the urethra and enter into the bladder.

The practice of gradual dilatation has been very successful in my hands during the last thirty years. About ten years ago I observed that to leave the metallic bougie only a short time in the urethra was more advantageous than to leave it a long time, or even twenty-four hours, as some surgeons still recommend.

At the same time I take the liberty to exhibit here my improved metallic explorator of the urethra, which has many advantages over the old elastic bougie à boule. In practice the bougie à boule and the bougie olivaire have been often confounded. I daresay you have read the controversy about it by my able friend, Mr. Teevan, so I will not say more on this subject. In my metallic explorator you observe the shoulder is rather abrupt, and the reason of this is, because in drawing back, deviation or slight tightening of the urethra can be detected.

For the diagnosis of strictures near the orifice of the urethra, or any other disease near the orifice of the urethra, I use this speculum I now exhibit to the Society. But to come back to my subject of cutting strictures of the urethra, I am obliged to state that in some exceptional cases dilatation will not succeed.

Some patients will object to the long treatment by the metallic bougie; or they are on active service in the colonies, and have no time to stay in England; they want to be cured, and avoid the risk of being troubled with retention of urine in a distant country, where good medical advice is scarce. Or in some cases the stricture or strictures are so contracted, that dilatation is almost impossible; or if even dilated, the strictures remain open only for a very short time, and retention of urine recurs at the slightest cold or a little excess in *Baccho et venere*. In all such cases I think division of the stricture is required. Other methods of treatment have been recommended for such cases, as splitting, potassa fusa, electric cauterisation.

I shall give you briefly my personal experience and view of these methods of treatment. Splitting was introduced into English surgical practice about fifteen years since, and

(*a*) Read before the Medical Society of London.

has found many advocates. At that period nobody knows better than you, Sir, that I prophesied, "The profession will be disappointed." The prophecy has been realised. The reasons I then gave, were (1) we do not tear parts in surgery, when they can be cut; (2) we do not know what we tear; and (3) the reaction and contraction after lacerated wounds is more severe than incised wounds; (4) the local nervous system of the urethra will certainly be more injured, and therefore the patient will be more exposed to pyæmia.

I oppose cauterisation of strictures on several grounds: (1) There is nothing to be destroyed; the constriction of the urethra is the result of want of material; it is contraction; (2) if we destroy the contraction by potassa fusa, or the electric cautery, we shall have a new cicatricial tissue more troublesome than the previous stricture. We see the result of burning in cicatrices on the external surface of the human body, and how troublesome they are to treat. We do not burn again cicatrices after burns, but we divide them; or in some cases try the mechanical treatment of extension. Cauterised strictures seen four or five years after the operation, have been the most troublesome in my practice.

Having stated my objection to splitting and cauterising strictures, I will now give my views on cutting them.

Several methods of cutting have been proposed and practised. 1. Internal division; 2. external division, which is practised by different methods (*a*), Syme's operation; (*b*) a boutonnière; and (*c*) my operation, the subcutaneous division of strictures. I call it my operation, because efforts have been made to deprive me of the credit of the invention of this method of operating. Before I had published my first case in the *Medical Times and Gazette* 1853, there was not one word mentioned in any book or in any printed matter previous to this date, on the subcutaneous division of strictures. It has been attributed to two dead men, in the year 1869, by a surgeon who wrote a book on the subject of stricture, to have performed this operation. Unfortunately for the writer, I have the clearest proof of his error, if not to call it by a more severe expression.

In the year 1853, Mr. Syme read a paper on his operation before the Royal Medical and Chirurgical Society, and I wrote the review on it in the *Medical Times and Gazette*, and in this review I have related a case of my operation in contrast with Syme's operation. Syme never laid any claim to the operation at that period. Mr. Avery never laid any claim to the operation. There is still a member of our profession alive, who will testify to the accuracy of my assertion, and who was present at my conversation with the late Mr. Avery on the subject. I could give you farther proofs of my assertion, but I will not detain you longer on the subject by my personal complaints against the erroneous writings by surgeons on this subject.

The most frequently practised operation in our time is the external division of strictures, and a number of instruments have been invented to make the operation safe and successful.

I have given up the operation for these reasons:—1. We have to confide too much to mechanism in cutting strictures, and the tyro-surgeon will find great difficulty in using them; they will be even dangerous in his hands, if not used with the greatest precaution. 2. We are never sure we are cutting in the exact spot, or have cut completely the whole extension of the stricture. I know many contrivances have been made to obviate the uncertainty of the above-mentioned instruments. In theory they seem correct, but in practice they prove faulty. With the internal urethrotome we cannot be sure we have made a *deep* and *long* cut; nor can we be sure that the stricture is completely divided, and without these precautions a certain failure will be the result of the operation. If the first cut of the urethrotome is a failure, the instrument cannot be introduced with ease in the same sitting. I practise internal division only in cases of strictures near the orifice of the urethra, which is done by a grooved dilator (I now exhibit here) and a small tenotome. In one case, where I had the advantage to have the able assistance of your President last year, he could convince himself of the easy execution of the operation. I also exhibit here an instrument which I leave, after the operation, in the urethra to arrest hæmorrhage, and which I call Sonde-tourniquet. External division may be performed by three methods:—

(*a*) Syme's operation, which is an operation almost as severe as cutting for stone.

In Syme's operation parts are divided which have no connection with the strictured part. The wound is large, the healing process is long, consequently, more danger of pyæmia; and after such a large wound re-contraction of the divided parts is more to be feared. The only exceptional indication for Syme's operation may be traumatic strictures, where sometimes the skin does contribute to the contracted stricture or strictures. But even in these cases I would give first a trial to the harmless subcutaneous division, and try to overcome the skin cicatrices by dilatation, and I should proceed to Syme's operation only after the failure of the subcutaneous method.

(*b*) The boutonnière is another mode of operating on impassable strictures; it is also external division of the urethral stricture.

I was at one time a great partisan of la boutonnière when no instrument can be passed. But I must say that I am very sceptical about such strictures, where no instrument can be passed. The resources of surgery thirty years ago were limited, but since we have the whalebone olivaire bougie, since we have the bougie entortillé I think that with patience and skill very few strictures are impassable, and once the smallest bougie passed even of the size of a hair, the retention of urine ceases according to my experience. Impassable strictures are generally in a state of swelling and inflammation, and it is this and the tortuous nature of the stricture, which make them impassable. The retention of urine increases the inflammation of strictures, and as soon as the bladder is relieved, the stricture becomes amenable to treatment. If all efforts to pass the finest bougie fail, there remains, as the last resource, the subcutaneous puncture of the bladder in connection with the vacuum pump, an operation without danger and of easy execution. After having stated my convictions on this subject, I believe, the cases where la boutonnière is indicated, have greatly diminished.

(*c*) I will now speak lastly of the subcutaneous operation for curing strictures.

I have practised this operation in cases in which it is indicated during the last twenty-five years. The operation is of easy execution. I have described it in another place,(*a*) and I will not repeat its mode of performance. I will only show you the instruments I use for the performance of the operation.

1. A grooved conductor,(*b*) with two knobs at its end. 2. A tenotome for cutting strictures subcutaneously *in front of the scrotum*, and this long-necked tenotome for strictures *behind the scrotum*.

I have seen one of my cases about six months ago, operated upon fifteen years since. The gentleman is married, and has one child. In this case I could not find the least trace of a stricture. I think, Sir, I took the liberty to send you a case for examination, operated upon about six years before, and you could not detect a vestige of stricture.

I think I must attribute the success of my operation to three causes. 1. By the subcutaneous method the stricture is always divided in its entire length and depth. 2. During the treatment I pass an instrument, which I call bougie à bulbe, and I now exhibit it to you. By this instrument the portion of the urethra operated upon is much larger than the rest of the urethra, and so allows

(*a*) Proceedings of the Royal Medical and Chirurgical Society of London. Vol. iv. 1864. Page 361.

(*b*) I have seen my conductor altered by diminishing the size of the knobs. This is an error. The knobs should be prominent to be good guides for the finger, and, secondly, to stop at the widest part of the stricture.

some space of contraction of the cicatrice, when this takes place. A third precaution is (when the stricture is divided) to dilate the stricture several times a-week in the first six months after the operation. According to my experience, contraction is to be most feared during the first six months, and the liability to it is kept up during the first two years after the operation. A well-known surgeon said once in his lectures on the treatment of strictures, "do what you will, tear them, cut them, dilate them, the stricture will return again." Well, that is a sad prospect for surgery! I am not of the same opinion. I believe a stricture well operated upon, well-treated afterwards, and carefully attended, will not re-contract. Wounds of tendons or any tissue will contract, when neglected; we see such cases daily in the cure of club-foot. In fact, at this moment, many surgeons of our day are very sceptical about the cure of club-foot by operation, repeating the same story as of strictures. Those cases have been simply either neglected, or badly operated on. The plain truth is, we can cure a club-foot in modern times. From what I have now stated, I come to the following conclusions :—

1. A stricture can be cured by dividing it.
2. That the easiest and surest method is the *subcutaneous* incision, with few exceptions, in which other operations are indicated.
3. The cut should always be *long* and *deep*.
4. That two years' treatment is necessary to get a successful result.

ON MATERIALISTIC PHYSIOLOGY. (*a*)

By J. M. Winn, M.D., M.R.C.P. Lond.,
Senior Physician to St. George's and St. James's Dispensary.

The author commenced by saying that the unphilosophical and extravagant dogma that matter can think was now so loudly and confidently asserted, and so widely spread by a numerous class of medical men and physiologists, both in this country and abroad, that the time had arrived when a doctrine so fallacious, and so fraught with danger to the best interests of society should be fairly and carefully scrutinised. It was not, he said, by mere assertion, or the use of obscure and pedantic language that such a theory could be established, and if it could be shown that the arguments on which it is based are shallow and speculative, words could scarcely be found too strong to censure the recklessness and folly of those who promulgate views so subversive to all morality and religion. The physicists had utterly failed to establish their position. They were asked to prove by inductive reasoning the truth of their theory that the Universe is the mere outcome of molecular force. Their defence has been clearly proved to be of the most evasive and inconclusive character. Physiology had, therefore, now become the only battle-field on which scientific atheists could assail us. He contended that the doctrines of the modern school of materialistic physiology are permeating all classes of society, and were most conspicuous among the younger members of the medical profession, which is to be expected when so many of the influential teachers holding high rank in our medical schools, carried away by intellectual pride, have unhesitatingly and recklessly done their utmost to imbue the minds of the rising generation of students with the notion that all our time-honoured creeds are the assumptions of credulity and folly. The students are taught to look down upon them with contempt, and to substitute opinions, which, if true, cannot be of the slightest practical importance, but must inevitably, sooner or later, make shipwreck of the highest hopes and noblest aspirations of our nature.

In confirmation of this statement, Dr. Winn referred to the materialistic views propounded by Professor Maudsley in his opening address at the London University College, and regretted that a journal having so large a circulation as the *Lancet* should have held this address, so full of dangerous materialistic thought, up for especial admiration. Dr. Winn took exception to the term "Physiological Psychologists" as illogical, inasmuch as physiology and psychology are distinct sciences, and substituted that of materialistic physiologists as more appropriate. Dr. Winn observed that the physiological psychologists, as they call themselves, speak as confidently of their speculative opinions as if they were acknowledged facts, and as if recent researches had thrown a flood of light on the functions of the brain and spinal cord, but he challenged them to show that any *one* really great fact had been elicited since the time of Sir Charles Bell and Marshall Hall, and observed that Dr. Ferrier, in a recent work on the "Functions of the Brain,' reiterated a remark made by Dr. Winn eighteen months' ago, that we are still "on the threshold of the inquiries." He afterwards referred to some interesting cases of insanity published by his friend Dr. W. A. T. Browne (ex-commissioner in lunacy for Scotland) entitled "Problems for Pathologists," which appeared in the *Journal of Psychological Medicine* for October, 1876. These cases could not be explained on purely physiological or pathological principles. Dr. Winn summed up his arguments in the following manner :—

1st. It was evident that no great discovery as regards the functions of the brain and nervous system has been made since the days of Sir Charles Bell and Marshal Hall.

2nd. That in no instance has it been found that vital and physical force were interchangeable. The doctrine, therefore, of a correlation of force could not be applied to the elucidation of vital or mental phenomena.

3rd. That respecting the nature of insanity, there are questions which cannot be answered by materialistic psychology, and that a recent attempt to frame a classification of mental diseases without taking the psychical element into consideration had proved an utter failure.

4th. That memory, which it had been confidently asserted was a bodily function, could not be localised in any part of the brain, the microscope as yet having failed to detect the faintest indication of the symbols of any language impressed on the cells of the brain.

5th. That the doctrine of unconscious cerebration, of which we have lately heard so much, and which, if true, would reduce man to a mere automaton, admits of an explanation that does not require us to recognise the exclusion of mind from the highest faculties of mind.

After again referring to the pernicious teaching of the new school of physiology, Dr. Winn concluded his address as follows :—"It is not by glib phrases, sophistical arguments, and *ad captandum* rhetoric, that this new system can be supported, and it may be hoped that ere long 'materialistic physiology' will be consigned to that limbo which has already engulphed so many false systems of philosophy."

(*a*) Abstract of an Address delivered before the Victoria Philosophical Institution, Monday, January 8th, 1877.

TRAMORE AS A WINTER RESORT.

By Jeremiah Dowling, M.D.

During the winter (in Ireland) an invalid requiring change of air and a genial climate, but unable—from want of means or from debility—to seek them abroad, labours under a disadvantage; yet there may be found around our own southern coast, I believe, a few places where a sojourn even in winter would greatly contribute to the restoration of his health. Invalids, indeed, are sometimes ordered to go abroad when they are not able to bear the pain of parting from their families, the fatigue of a long journey, and the many drawbacks to a residence among foreigners; and if the end comes, what

can make death more painful than to die far away from home and friends? It is, however, chiefly for those not rich enough to afford to go abroad that I write and give my own experience of one place, but with no desire of depreciating the claims of other places on our south coast.

In selecting a place of residence during the winter months for an invalid, Tramore—a pretty little town on the south-eastern extremity of Waterford, built, for the most part, on the slopes of high hills overlooking a fine bay—merits more attention as a winter resort than it has hitherto received. The town is easily reached by rail. Its strand, one of the largest in Ireland, has given name to the town (*traigh mor*, great strand), and becomes in summer a pleasant promenade. An excellent road and footpath, running at times perhaps somewhat too close to the sea, enable the visitor to enjoy a ramble along the bold and picturesque coast that forms the western boundary of the bay. The bay itself, which at its widest part (from Great Newtown Head to Brownstown Head) is about eight miles wide, is frequently as placid as a lake. In calm weather its waters, breaking lazily upon the strand, form, as it were, ten thousand patterns of lace; while after a gale of wind from the south, the incoming tide dashes its white-crested waves bravely over the high wall intended to hem them in. But this wall serves another, and even more useful, purpose; for it completely wards off the north winds from those who sit upon the rocks at its base, or walk upon the adjoining strand when the tide is out. On a cold day, no other place in all Tramore affords so warm and pleasant a retreat as this portion of the strand, for the wall not only wards off the north winds, but also reflects the sunshine. I have now touched upon the great—in fact, the only—drawback under which Tramore labours—that it affords no adequate protection against north winds; and unless this defect can be remedied, however charming in other respects, it can never become a favourite winter resort for invalids. It is, I should mention, well-protected by a range of high hills against the north-west winds: and had those hills swept in the form of a crescent round the north side of the bay, everything that nature could have done had been done for Tramore. Art, however, might make up in some degree for the defect of nature, and what is required to be done is—to construct a walk and carriage-drive close to the strand, and to ward off the north winds by a wall sufficiently high; so that an invalid when taking exercise might not be exposed to their chilling influence. A portion of the road is already made.

But on a fine winter's day, with a breeze from the south, it is really delightful to saunter with one or two friends along the Doneraile Walk on to Lady's Cove, and by a good road on to Newtown Cove, where (resting in the warm sunshine) the visitor may look out upon a splendid sea: and if he is sufficiently adventurous, he may—by a footpath which runs along the steep and rocky coast—push on to Great Newtown Head, where the "Metal Man," with outstretched arms, warns passing vessels away from that dangerous shore. Though it would scarcely be prudent for a person whose nerves have been unstrung to attempt the latter part of this walk (as the footpath sometimes runs dangerously near the shore), the whole coast from Lady's Cove to Newtown Head is well worth seeing; for the sea, in the course of ages, has made excavations in it on a gigantic scale, and now—denuded of all covering—lie far down below huge black rocks proudly defying the hand of Time and the action of the ocean. Along the Doneraile Walk seats have been placed, but from the end of this walk to Great Newtown Head not a solitary seat has been provided, where a visitor might rest. If the visitor prefers to drive he can go by car to Newtown Head, and in this way, too, will catch fine views of the sea on his left hand, and of the Comeragh Mountains away in the distance on the right. From the Head a grand view of the Atlantic is to be obtained, and of the coast of Waterford as far as Helvick Head.

There may be, and, doubtless, there are, other places along our southern coasts more favoured by climate and situation, and better adapted for a winter resort for invalids than is Tramore; but they are (with the exception of Queenstown) almost inaccessible in winter, and afford insufficient accommodation. But for an invalid able to take exercise in the open air I should prefer Tramore to Queenstown in October, November, and December; for, though Queenstown is beautifully situated and better sheltered from north winds, it possesses neither a walk running close to the seashore nor a strand on which he may saunter and sniff in the delicious odour of the seaweed. Persons suffering, however, from pulmonary complaints can scarcely derive any benefit by residing in Tramore even in the early winter months, for there—as in all other parts around the Irish coast—the air, however mild, is always nearly saturated with vapour, which on any *sudden* fall of temperature is precipitated as fog, mist, or rain.

But more essential to the restoration of an invalid's health than sea air, sunny skies, rambles along the shore, and the ever-changing aspect of the ocean, is the society of some one whose loving care (anticipating his wants) will keep his thoughts from always centring in himself, and whose cheerful conversation will make him forget his infirmity. In health one may find sufficient enjoyment in communing with nature, in the politics of the day, or the fashions of the hour, in reading books or newspapers, or even in the gossip of the town; but when one is convalescing from severe sickness, or for a long time suffering from any disease, they will awaken but little interest and afford no consolation. It is not the body only that is suffering; the mind is enfeebled, the spirits depressed, hope nearly extinguished in the breast, and, instead of the spontaneous laughter of health, tears spring unbidden to the eyes. To attend, then, to the body alone, to rely upon food, air, and the other agents which are supposed mainly to affect its welfare, is to do only half the work, and that not the most important. That subtle entity, the mind, which influences the function of every organ of the body, must also be attended to; and where the office of the physician ends, the office of an intelligent friend begins. It will be the duty of a friend to try and relieve the invalid's mind from the cares and anxieties infesting life, to direct the conversation always to cheerful subjects, to revive and to strengthen hope, and to point out that in his case, after all, there is much reason for thankfulness. Unless this be done, unless his mind be soothed, strengthened, and sustained, whether he spend the winter at home, or abroad in some more genial clime, we may look in vain for a restoration of his health.

Clinical Records.

OBSTETRIC MEMORANDA.

Reported by JOHN W. MARTIN, M.D.,
The Grange, Dronfield, near Sheffield,
Late Assistant-Surgeon, Mayfield Factory Dispensary, Portlaw.

CASE III.—*Seventh pregnancy at full term—Previous labours very hard and prolonged—Great œdema of the lower extremities, and anasarcous condition of the rest of the body, specially about the eyelids and face—Bronchitis and weak circulation for some weeks before delivery—Sixty-five grains of chloral given as before in three doses—Labour rapid, easy, and much less painful than before—Post-partum uterine contraction good—No post-partum hæmorrhage.*

THIS case may be given in briefer detail. Mrs. W——, æt. 32, seventh pregnancy at full term; previous labours prolonged and difficult, pains very severe and prostrating. For some months before delivery, the lower extremities were much swollen with dropsical effusion, and there was

general œdema of the body and face, especially about the eyes. She was also troubled with severe bronchitis, for which I treated her with good effect during the last three weeks preceding delivery.

She was in a very despondent condition, fearing the worst. The heart's action was very weak.

I was called to her at 6.10. p.m. She had had strong and regular labour pains, from about 1. p.m., and suffered from sharp premonitory ones, from the preceding evening. On examination, I found the pelvic cavity roomy, the passages cool and moist, the rectum empty, the patient passing water freely, the pains strong, regular, and succeeding one another at rapid intervals. The head was presenting, the waters were unbroken, and the "os" was dilated to something less than the size of shilling; its edges were very thin, hard, sharp, resisting and undilatable. I at once gave a dose of the chloral, and followed up with two others, at intervals of twenty minutes. I gave in all sixty grains. Its good effects were soon apparent. The same changes rapidly took place, as already described in CASE II. These effects were, however, even more marked, as the progress of the case was very rapid. She enjoyed the same quiet deep sleep during the intervals between the pains, and felt herself greatly refreshed. The pains themselves were not nearly so intense, although the contractions were very strong. The child was born at 8.20 p.m., two hours after the administration of the first dose of chloral. It was a male of very large size. The anterior lip of the uterus got caught between the symphysis pubis and child's head. I had to push it up, and keep it there, until the latter had descended sufficiently into the cavity of the pelvis, to prevent of its prolapse. The pulse remained at 84 beats to the minute. The post-partum contraction of the womb was good, expelling the placenta at the end of ten minutes, unaided by pressure. There was no post-partum hæmorrhage. The patient felt most grateful, asserting that she had never had such an easy time of it in all her previous confinements. She declared the effects of the chloral to be most soothing and refreshing.

From the foregoing cases it is evident that chloral:—

1. Had a strong controlling influence over the amount of pain felt.

2. That it secures quiet refreshing sleep during the intervals of pain, thus husbanding the patient's strength.

3. That it has no retarding influence upon the progress of labour.

4. On the contrary, it seems to have a decidedly beneficial effect in steadying, and directing to a favourable issue, the uterine contractions; also in hastening the dilatation of the "os" uteri.

5. It does not in any way weaken post-partum uterine contraction.

From my experience, it is of great service, where, from idiosyncrasy on the part of the patient, the smallest dose of opium could not possibly be given.

I may perhaps be excused if for the sake of the student, I briefly enumerate the chief points of practical interest to be borne in mind on being called to a case of labour.

1. Be careful to show no consciousness that the occasion is one calling for explanations of what you wish done in the way of examinations, &c. Whatever you have to do, do it quietly and judiciously, carefully and gently, as a mere matter of routine, calling for no comment from either doctor or patient.

2. Ask the patient, if no nurse be in attendance, to lie on her left side, with her hips out well towards you, and her knees well drawn up. If a nurse be present, give her directions to have the patient placed in the proper position.

3. See that your hand is well warmed, and the index finger oiled, or anointed with lard.

4. Previous to making the examination, gain your patient's confidence, and place yourself *en rapport* with her, by asking in a quiet tone a few questions as to the number and nature of her previous confinements, when her labour commenced, &c.

5. Then pass your hand quietly under the bed clothes, and without remark feel gently for the labia, separate them, and avoiding the clitoris, pass your finger cautiously and slowly, backwards and upwards, until you reach the cervix uteri.

6. In passing upwards, satisfy yourself as to the state of the rectum, whether loaded with fæces or not.

7. Also as to coolness and moisture of the vagina, or as to its being hot and dry.

8. Note the general capacity of the pelvic cavity, whether roomy or contracted.

9. Feel for the promontory of the sacrum; if difficult to reach it is a good sign, showing the absence of contracted conjugate diameter, or deformity.

10. Having reached the "cervix," note whether it is pendant into the cavity of the vagina, like the nipple of the breast, or whether it is all taken up, and stretched over the presenting part. If not taken up, and the os remains undilated, it will be additional evidence in favour of concluding that true labour has not yet come on, and that any pains complained of are false pains, to be relieved by a dose of either opium or chloral, or both combined.

11. Quietly make out the position of the os uteri; this is sometimes situated very high up, close to the sacral promontory. Bear in mind the possibility of a double "os" being present, one of which may be dilated, and the other not so. Any oversight on this point might give rise to an obvious error in your prognosis. Note the amount of dilatation, the condition of the edges of the "os", whether thick, rounded, moist, and yielding; or thin, sharp, hard, resisting, and undilatable, and tending to dryness. The latter condition, in the majority of instances threatens a prolonged labour, and usually accompanies a state of debility and want of rest on the part of the patient. In such cases, a good dose of opium or chloral, given as already described, will be found to exert a most beneficial effect, in controlling and properly directing the uterine contractions; the condition of the parts usually change rapidly, the os becoming thick, rounded, and dilatable, and the passages bathed in mucous.

12. Satisfy yourself as to the nature of the presenting part of the fœtus, the condition of the membranes, and the quantity of "fluid" present.

13. It will be found a safe good rule to leave the membranes unruptured to the last; early rupture may lead to troublesome complications. Rupturing at the completion of the first stage sometimes hastens labour; but the risk of inducing a difficult case ought to make it a matter of very careful consideration. I have always found those cases do best, in which the membranes remained unruptured, until they appeared as a bag, at the external orifice; the descending bag of waters is the natural and best distending force, preparing the way for an easy descent of the head.

14. If the rectum be loaded, clear it out with a simple enema, such as some warm water having a couple of tablespoonful of salt and sugar dissolved in it.

15. Learn whether your patient passes water freely; distension of the bladder would prove a source of delay to the birth of the child.

16. If the patient has borne several children, and the abdominal walls are flabby, pendulous, allowing the womb to fall forward, thus altering its proper axis, the application of the binder will be found very useful.

17. Where the pelvis is roomy, the maternal passages are cool, moist and dilatable, the os uteri well dilated and dilatable, the patient passing water freely, and the rectum well cleared out, Kristellar's method of assisting labour tedious from inertia, may be found useful. Place the patient on her back: standing above her as it were, apply the palms of both hands to the fundus of the uterus, the fingers and thumbs extending forwards towards the pubis and crest of ilium; then make steady pressure at the onset and during the continuance

of each pain, by this means aiding in the expulsion of the child.

18. Do not be in too great a hurry to aid with pressure the exit of the head through the external orifice; give time for the full distention of the perineum, which gradually thins out and expands with each pain; retard the progress of the head if necessary. Attention to this point in my experience reduces the danger of rupture to a minimum, and in the majority of cases renders support to the perineum unnecessary. Of late my experience inclines me to believe, that the application of the hand as a means of support to the perineum is rather injurious than otherwise, heating the part and inducing dryness, thus interfering with its natural distension. The natural course in this instance will very likely prove the best.

19. Upon the child's head being born, clear its mouth and throat of all mucous, by passing your little finger well down into the pharynx; do this cautiously; then examine if the placental cord is twisted round its neck: if it is, pull it out gently, remembering the danger of breaking it, and slip it if possible over the child's head, if not, over its shoulders and body. Support the head whilst awaiting the expulsion of the shoulders and body. During the expulsion of the child, place the left hand upon the fundus of the uterus, and follow it downwards with careful but firm pressure.

20. Upon the birth of the child, again clear out the mouth and throat, and compel it to cry if need be, by slapping it well over the buttocks and back; should any delay occur in setting up of natural respiration, direct the nurse or some friend in attendance to make pressure upon the "fundus uteri," and at once practise artificial respiration, Sylvester's method being the best; apply cold suddenly to the surface of the body, and make rapid frictions with either brandy or whisky.

About sixteen respirations to the minute will be sufficient, when practising artificial respiration.

21. Allow a few minutes to pass by before applying the ligatures to the cord to see if pulsation ceases. The ligature next the child's body should be placed some three inches from it, and should be firmly secured with as many as three knots. The ligatures should be made of strong housewife thread, each one being composed of some three or four strands of the thread. After dividing the cord with a scissors, dry the surface, and examine if there be any bleeding present. This is a point to be well attended to, as any oversight might lead to injurious effects to the child, and discredit to your own skill and reputation.

22. Allow the womb some fifteen to twenty minutes, rest, keeping up firm but gentle pressure over the fundus. Very frequently, at the expiration of the time of grace, the womb expels spontaneously, with a good strong contraction, the placenta and membranes entire.

23. Should delay occur, increase the amount of pressure, apply your hand, previously cooled by being dipped into cold water, suddenly to the surface of the abdomen; these means frequently effect the object you have in view. I would advise, as far as possible, that the cord should not be dragged upon, as is very frequently done and recommended.

24. If firm pressure to the fundus, sudden application of cold to the abdomen, gentle traction, and causing the patient to cough, fail to induce expulsion of the placenta, the right hand must be washed perfectly clean, and then gently introduced per vaginum and the mass removed.

25. Immediately after the delivery of the placenta has taken place, wherever there is the smallest risk of hæmorrhage, a dose of ergot, half a drachm to two scruples, should be given.

26. A point worth remembering in connection with making pressure upon the fundus uteri is this: do not be satisfied with merely pressing upon the surface of the abdomen, but feel carefully for the body of the womb through the relaxed abdominal walls, and then grasp it firmly, and at the same time gently.

27. In the case of post-partum hamorrhage occurrin in addition to the ordinary means for arresting it, viz., pressure, cold applications to the abdomen, administration of ergot in repeated doses, of half a drachm every ten or fifteen minutes, brandy, elevation of the patient's hips, introduction of the hand into the uterus, mopping out the internal surface of the womb with a solution of the perchloride of iron, one part to six, or the intra-uterine injection of this solution, is recommended; pressure upon the abdominal aorta, the application of the galvanic current, and transfusion may be tried in extreme cases.

28. Delivery having been effected, the placenta expelled, and no post-partum hæmorrhage occurring, all clots of blood must be removed from the bed, the latter being made as dry and comfortable as possible. A clean sheet, in four folds, should be slipped under the hips. If you have taken the precaution before delivery to carry the night-dress well up under the waist, towards the armpits, this will be dry and comfortable. It remains only to apply the binder. This must be done carefully, with as little movement of the patient as possible. The binder should be a yard and a-half in length, and fifteen inches in breadth; and is best made from a piece of strong old linen or calico. It should be rolled up from one end, to allow of its being easily slipped beneath the patient *en masse*. When binding, place the patient on her left side, with her lower extremities and body in a straight line; place the binder so that its lower border will be below the trochanteric prominences; then fold round the body from below upwards firmly, and bind, securing the bandage where possible with safety pins. The upper border need not be drawn very tightly, to prevent its interfering with respiration.

29. If there is any tendency to relaxation on the part of the uterus, a good firm pad may with great advantage be applied over it, beneath the binder.

30. Examine your patient's pulse; if it remains full and firm at 80 beats the minute all is well. If it passes beyond a hundred there is always cause for anxiety and watchfulness.

31. Again examine the portion of cord attached to the child, to be assured that there is no bleeding therefrom. See also that the piece of linen in which it is to be wrapped has been well singed at the edges which are to be in immediate contract with the cord.

32. The application of the infant to the breast as soon as dressed, is a safe measure for the mother, tending to prevent hæmorrhage.

33. Do not leave the house for an hour after delivery has been effected, and during that time watch carefully the amount of discharge, and the state of contraction on the part of the womb.

34. A thorough acquaintance with the minutæ of treatment necessary in dealing with ordinary cases, makes it a matter of comparative ease when called upon to treat those which are graver in their nature.

Literature.

AN ELEMENTARY TREATISE ON DISEASES OF THE SKIN. (a)

After a modest little preface the book opens with a chapter on the anatomy of the skin, in which it is denied that the horny layer of the epidermis is derived from the cells of the Malphigian layer. The author believes that the cells of the horny layer never were cells of the rete; that the constituents of each layer are regenerated independently of the other. He says that there is no gradual change of character between the two layers, and that the

(a) "An Elementary Treatise on Diseases of the Skin." By Henry G. Piffard, A.M., M.D. Macmillan and Co., London and New York.

independence of the two sets is shown by their different behaviour with carmine-solutions and reagents. The author however, expresses his inability to explain how the horny layer is nourished and regenerated. The diagrams illustrating this chapter are, for the most part, borrowed from Sappey, and are extremely well executed. The second chapter (three pages) treats briefly of the physiology of the skin.

Although Dr. Piffard intends his book as a guide for the student (preface), we apprehend that the student searching for information upon the subject of psoriasis might be somewhat confused on reading (p. 179) "psoriasis of the palms of the hands and soles of the feet . . . is almost without exception a syphilide, and not psoriasis." We quite understand what Dr. Piffard wishes to convey in this somewhat paradoxical paragraph, but one who writes for students, in the general acceptation of the term, should be careful to express himself in clear and definite terms.

In the treatment of acne rosacea the author recommends obliteration, by puncture, of the dilated veins, the use of the constant current, and of the Faradic current (as advised by Cheadle in the *Practitioner*, July, 1874).

In speaking of alopecia areata (p. 285), Dr. Piffard writes, that the subject "must be approached with a good deal of caution, as the views held concerning it by various authors do not by any means agree." It is for this very reason that any modern writer on dermatology—if he has worked at and studied this branch of medicine—should speak out boldly. We do not think that every one connected with a speciality should write a book. But he who has something to teach should write, and that fearlessly. In this way truth is discovered, and not by stringing together the well-worn opinions of other men, and fearing to express our own.

Though there is much that is good in Dr. Piffard's book, there is little that is new.

THE COLLATERAL CIRCULATION IN ANEURISM. (a)

Dr. Smith presents to his readers the very interesting details of the case under notice, in the form of a pamphlet some twenty-five pages in length. His observations extend over a period of ten years, and embrace in their record the origin and progress of the tumour, the effects of treatment, which in this case was singularly bold and effective, the death of the patient, and, finally, the *post-mortem* appearances of the parts involved. Shortly after the application of ligatures to the innominati and carotid arteries, there was a recurrence of pulsation in the tumour. The original procedure of tying a ligature on the vertebral artery was successfully resorted to, with the result of arresting pulsation, and the cure of the aneurism for a period of nine years, at the end of which time it again returned. In the attempt to arrest it the internal mammary was ligatured, but without success. After death it was discovered that the collateral circulation was being carried on through directly anastimosing branches of the subscapular, with perforating branches of the aortic intercostals; these branches were seven in number, each one being about the size of a large goose-quill. Another original procedure recorded is the use of fine shot, placed in the wound made for the purpose of applying the ligature, as a direct compressing force, to aid in the occlusion of the artery. About two and a half ounces of No. 9 shot were allowed to remain in the wound for thirty-eight days, without causing any inconvenience, and proving of great service in making pressure upon the artery.

As a contribution to the annals of aneurism, this pamphlet will be found well worthy of perusal, being minute in details, practical and instructive.

(a) "The Collateral Circulation in Aneurism. Report of the Successful Ligature of the Innominati, the Common Carotid, the Vertebral and the Internal Mammary Arteries, in a Case of Right Subclavian Aneurism." By A. W. Smyth, M.D., House Surgeon, Charity Hospital, New Orleans.

THE GRIEVANCES OF MILITIA SURGEONS.

The following Statement of Facts is issued by the Committee of the Militia Surgeons' Society of Great Britain, and may be taken as representing the case of the Militia Surgeons, who by the "Clauses of a Royal Warrant, dated W.O., 19th July, 1876," and the "Instructions of the Secretary of State for War" thereon, are deprived of the larger proportion of the incomes derived from their appointments:—

1. That they hold their Commissions under an Act of Parliment.

2. That they were compelled originally to reside at the head-quarters of their regiments for certain purposes, viz.—attending staff and families, attending adjutant on recruiting service, and examining recruits at head-quarters; to these were added the examination of recruits for line and marines. For all these duties allowances are provided under the Act. Although in certain cases the restriction as to residence was withdrawn, believing that the emoluments of the appointment would remain intact, most of the Surgeons continued to reside at head-quarters.

3. That for the performance of the above duties, the pay and allowances vary, according to the size of the regiment and the means adopted for obtaining recruits, from £150 to £300 per annum.

4. For the above income, in addition to the duties detailed, the militia surgeon held himself liable to be embodied with his regiment, sent hundreds of miles away, from home, or to be sent annually to camp or manœuvres, to the detriment or entire loss of any private practice he might have.

By the establishment of the Brigade Depots, by the terms of the New Warrant, and the orders which have been issued with regard to recruiting in general—

A. All the before-named sources of income particularised are withdrawn, and in addition—

B. By handing over the medical charge of the militia recruits, during their preliminary drill, to the surgeon of the depot, the regimental surgeon is deprived of a very large number of days' pay; and actually reduced to only 27 days' pay during the year. For these 27 days he is to receive an increase of pay of half-a-crown per diem, amounting to £3 7s. 6d., and this sum is to be received as a set off against, in many cases,

C. An actual loss of £200 per annum.

D. This increase becomes reduced to "nil," the fees, from other sources, such as examination of recruits for the line, &c., having been withdrawn.

For this 27 days' pay, what are militia surgeons asked to do under the New Warrant? To subject themselves to the risk of embodiment, to render themselves liable to be sent to camp, severed from home and practice, if any, for months or even years (this has happened twice during the last 22 years), and then to return without any claim for losses sustained, or services rendered, to head-quarters, to make a fresh start in life.

These are facts, and the actual requirements of the New Warrant for 27 days' old pay, plus £3 7s. 6d., and are identically the same as those under the Act, by which a militia surgeon has enjoyed an annual income of from £150 to £300; an income hitherto assured to him, and which he believed he would enjoy as long as he was physically fit and willing to perform all the duties required of him.

There are men of over 20 years' service who have served during two lengthened periods of embodiment, who are sent annually to camp for training, and who have attended every annual muster; others whose opportunities for private practice have been blasted because they belonged to the public service, and who have been pronounced dis-

qualified to hold civil public appointments for the same reason.

For the sum of £40 per annum (minus mess and other incidental expenses), militia surgeons are now asked to subject themselves to all the foregoing requirements of the service, and when they attain, or having attained, the age of 60, are to be compelled to retire without pay or pension. So hardly have the new regulations already pressed upon some, that they have had to break up their homes and seek for fresh openings for practice.

Are militia surgeons really in such a position that nearly the whole of their income can be taken from them without a word of compensation, and placed in a position worse than the lowest of civil servants? That they are deprived of a large proportion of their income under the terms of the New Warrant is allowed; that "cases of hardship will be fairly considered," has been promised by both Lord Cardwell and Mr. Hardy; but in contradiction of a statement made by Mr. Hardy in the House of Commons, 7th August, 1876, in answer to Dr. Lyon Playfair, "that until 31st December he could not form any definite opinion, or give any pledge as to compensation," he distinctly refuses, in a letter dated 15th November, 1876, and emanating from the Financial Office, W.O., to bring forward a vote for compensation—treating the question collectively and not individually—in the face of the numerous promises made by himself, Sir J. Pakington, and Mr. Cardwell, that each case would be carefully considered on its own merits. The case is a narrow one—viz., that under the Acts, we are entitled to certain advantages; that by a Royal Warrant, and W.O. regulations, it is sought to deprive us of these, denying to us at the same time compensation for actual loss, such loss being admitted by the authorities, and proved by returns of income from many of the surgeons in the service, to vary from £100 to £250 per annum. Taken upon an average of the last three years, of eighty returns already received, four are receiving £100 and under, thirteen from £100 to £150, thirty-eight from £150 to £200, thirteen from £200 to £250, eleven from £250 to £300, and one of over £300. Should the new regulations be carried out, £40 per annum will be the future income of the militia surgeon, should allowances for lodging, messing, &c., be still continued to him. From the above returns the loss may easily be seen, and the Government Actuaries could soon settle the question of compensation.

ROYAL COLLEGE OF SURGEONS IN IRELAND.

On Saturday last, a deputation from the College, consisting of the President, Dr. Kidd; the Vice-President, Dr. Robert McDonnell; the majority of the Council; and many of the Metropolitan Fellows, waited upon His Grace the Duke of Marlborough, Lord Lieutenant of Ireland, and presented to him the following Address:—

"May it please your Grace—We, the President, Vice-President, Council and Fellows of the Royal College of Surgeons in Ireland, desire to approach your Grace to offer our sincere congratulations upon your Excellency's arrival in Ireland, as the representative of our beloved Sovereign. We would, most respectfully, assure your Grace that we shall always be ready to further, by every means within our reach, the objects for which this College was originally founded—the improvement of the profession of surgery—the promotion thus of the welfare of the nation at large, and the providing of a sufficient number of properly qualified educated surgeons, as well for the service of the public in general as for that of the army and navy. So far back as the year 1844, this College established a Chair of State Medicine, the first of its kind in these kingdoms, which to the present day diffuses amongst the public sound sanitary knowledge. We shall be most happy to receive from the Government such suggestions as it may be pleased to offer in furtherance of all of these important objects. We avail ourselves of this opportunity of expressing a hope that your Grace will be pleased to honour our College with your presence as soon as its new buildings, the foundation stone of which was recently laid by his Grace the Duke of Abercorn, shall have been completed, whereby your Excellency will be enabled to judge of its capabilities to discharge the responsible duties confided to it by her Majesty and her Royal predecessors. In conclusion, we trust that your Grace may be pleased to extend to our profession that consideration and support to which it is so justly entitled."

His Grace replied:—Gentlemen, I accept with pleasure the congratulatory address from so distinguished a body as the Royal College of Surgeons, on my arrival as representative of the Queen in Ireland. It is universally admitted that the objects for which your institution was founded—namely, the improvement of the science of surgery, and the provision of properly educated surgeons for the service of the public in general, as well as for the army and navy—have been faithfully carried out year after year. Your College have sent forth men highly qualified to assuage the sufferings of humanity, and to alleviate the miseries of war, both on land and at sea. The proper consideration of sanitary measures is of vital importance to the welfare of a country, and great credit is due to your College that by establishing a Chair of State Medicine, it has led the way in improvements which are now attracting the continuous attention of the Imperial Parliament and of the Local Government Board. The interests of the institution which you represent will ever command my sympathies, and I shall gladly recur to your advice and assistance with regard to any sanitary measures which may be beneficial in this country. It will give me great pleasure to visit your new buildings when they are completed, and I cannot question for a moment that under your guardianship the high reputation which the Royal College of Surgeons has so long enjoyed will be maintained.

The President, Vice-President, and Secretary of the Council, were then presented.

After the reply of his Grace, the President of the College, with heads of other deputations, were invited to partake of the Viceregal hospitality; an incident which has never, within our knowledge, occurred on any former occasion.

Professor Tyndall will deliver a lecture at the Royal Institution on Friday evening next, at 9 o'clock, entitled "A Combat with an Infected Atmosphere."

The export of furs from Manitoba has been stopped by order of the Government, small-pox having broken out among the natives of a virulent type.

The use of iodine is sometimes objected to on account of its staining the skin. It is not generally known that a very small quantity of carbolic acid will render this agent colourless without destroying its therapeutic properties.

The Committee appointed to inquire into the occurrence of scurvy in the Arctic Expedition consists of the following: Admiral Sir James Hope, G.C.B. (president); Admiral Sir R. Collinson, K.C.B.; Vice-Admiral E. A. Inglefield, C.B.; Dr. James Donnet, Inspector of Hospitals, R.N.; Dr. F. R. Fraser, F.R.C.S.E. Mr. Vansittart Neale has been appointed Secretary.

THE
MEDICAL PRESS AND CIRCULAR
is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
,, IF PAID IN ADVANCE 1 1 0

, Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.C.
A. H. JACOB, 23 Ely Place, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 17, 1877.

THE CONJOINT SCHEME FOR IRELAND.

WE regret to state that the Scheme for Conjoint Examination for Ireland which was elaborated by a conference of deputies from the University of Dublin and the Colleges of Physicians and Surgeons, and which we published *in extenso* in our issue of the 29th of November, has been summarily dismissed by the Council of the Royal College of Surgeons without reference to the College at large, or attempt at revision of its details. This and the second effort of the Irish licensing bodies at self-reform, and with the decision of the Council fades away the last hope of a voluntary amendment of the existing medico-educational system in Ireland. No alternative remains, therefore, to those who desire a reform of the gross abuses which admittedly exist but to resort to Parliament for redress, and until the season ripens for such appeal from the corporations to the public we must be content to endure the sham certificate system—the multitudinous diploma nuisance—the huxtering of colleges and cheap universities for pupils' money, and the bidding of such bodies downward in the scale of competency and education.

We experience great regret, not only in the interest of the profession, but in that of the College itself at this act of its Council, and we prophecy that the policy thereby manifested will bring with it a speedy retribution, and that when the crying sins of the present Irish medical system come to be dealt with by trenchant hands, the power of the College to resist disendowment and to make terms for itself will be greatly and deservedly weakened. An obstructive resistance to improvement on the part of an institution which ought to have the loudest voice in the demand for reform is not only undignified but, commercially, foolish. It is the line of policy which universally animates nations (as in the case of Turkey and Rome) and institutions (as in the case of the Irish Apothecaries' Hall), which are destined for forcible reform, and the fact that such a policy can be adopted and maintained by such a body as the Irish College of Surgeons is, of itself, sufficient proof that the pruning-knife is wanted—that personal interests have sprung up which choke the growth of medico-educational purity, and which threaten to pull down the College from its legitimate position as the guardian of Irish surgical qualification.

Although there can be no excuse for the refusal of the Council to co-operate in any scheme for improvement, there is much to be said in their favour as reason why the College should not put such reforms in action without the unanimous concert of other licensing bodies. If the Council had had any desire for amendment it would have been its duty to give a definite expression to that desire and—so far as possible—to fix upon a method by which the amendment might be effectually carried out, and, this being done, it would have been open to it to suspend action until it could safely act, *i.e.*, until other competing bodies were forced into uniformity. By adopting such a course the Council would have placed the College in a safe position for a future campaign—would have retained its right to express an opinion on the subject—would have separated itself distinctly from institutions which live upon the abuses of the diploma traffic, and would, at the same time, have shifted all the responsibility of inaction upon the Medical Council whose duty it is to enforce uniformity. The Council had the example of conjoint examination in England before it, and it must have known that a Conjoint Examination Scheme adopted in the two countries, would probably be the basis of all future legislation, into conformity with which the Queen's University and the Scotch Colleges would be compelled to come. The action of the Council would seem to indicate that these considerations have been disregarded, and that the lucrative present attractions of the *status quo* are more influential than the more certain, yet distant benefits, arising from self-reform.

While, however, we deprecate with all emphasis the policy adopted by the Council, we cannot but remember that the Medical Council is mainly responsible for this failure of negotiation for Conjoint Examination. It was surely not to be expected—had it been more anxious for improvement than it is—that the Irish College of Surgeons would have bound the candidates for its licences to payment of £120, and to a three years' curriculum of study, as long as the Queen's University and the Scotch Colleges held their arms open to all comers, who brought £54 in their pockets, and two years' lecture certificates; and it is quite evident that coalescence of Examining Boards in Ireland is impossible as long as the Queen's University is allowed to make M.D.s, without academic study, with half medical study, and on the minimum money terms. Such difficulty did not exist to interfere with the Conjoint Registration in England, for there was there no underselling University, and the competition downward of the Scotch Colleges was comparatively inert. Under all the circumstances, we should not blame the Irish College of Surgeons for hesitating to give actual effect to Conjoint Examination, but we do deprecate the adoption by its Council of an attitude in which no sentiment but obstruction to improvement, and a desire to profit by existing abuses can be detected. The time is not long past since the Irish College cast its aspirations higher

than the interests of lecturers and grinders—when it regarded, as its first care, the maintenance of the character of the Irish School of Surgery—when denunciation by inspectors or cavil by commentators was impossible, and when its was the loudest voice for the maintenance of such a standard as would ensure that Irish surgeons shall be gentlemen and men of education. We repeat that its Council have abdicated such high functions in favour of the makers of compulsory laws, but we confess we entertain now no hope of medico-educational reform but in a summary Act of Parliament constructed with little regard to the ruling interests of Licensing Corporations.

FOREIGN MEDICAL PRACTITIONERS IN FRANCE.

The information which the *Pall Mall Gazette* recently communicated respecting certain restrictions which the French Government have lately placed upon foreign medical men, practising in France, has excited a good deal of comment, both from the medical and lay press. It appears to us, however, that the restrictions referred to have been too summarily condemned, and that the apprehensions and protests which they have raised are out of all proportion to the provocation that has been given, and cannot wholly be endorsed by any one who would take a liberal view of all the circumstances of the case.

In the first place, the *Pall Mall Gazette* made the Bill appear worse than it is. We are told that existing rights of practitioners already in possession of practice at health resorts and in Paris will be respected, but after a certain date, no British physician will be allowed to take up his residence in France, as such, not even if he desire and intend to limit his practice to his own sick countrymen. The privileges of practice are henceforth to be the exclusive possession of graduates of French Universities, and if Jenner or Paget desire to visit one of their patients who has been sent to recruit at Cannes or Pau, they must first pass five examinations, several of them of an elementary character, and must justify their preliminary education. This passage might imply that medical men, desirous of practising in any part of France, must go through the curriculum of studies observed at the medical schools of Paris, and "walk" the hospitals of that city, besides passing the examinations usually imposed upon the French candidate for a degree or licence to practice.

Were this the case it would be truly a hardship, and virtually would amount to the almost total exclusion of foreign, and especially of English, practitioners, from France. For there are very few medical students who would venture upon a medical education in France, with the object of commencing practice in one of the fashionable watering-places or health resorts of the country, inasmuch as he would know that those English residents who had been sent to those places for the benefit of their health, and to be under medical supervision, would not be very anxious to consult a young man who had just obtained his degree. One reason why so many English flock to certain French towns celebrated for the salubrity of their climate is, that hitherto they were sure to find on their arrival English medical men, who had a large experience, and who, even in many instances, enjoyed a large reputation.

The fact is, however, the French have not been quite so selfish or impolitic as might be inferred from the remarks of our contemporary. The law which is just now coming into force across the channel will oblige foreigners who wish to practice medicine, to undergo certain examinations in order to convince the French authorities that they possess the same amount of medical knowledge that is demanded from native graduates, or such as their own diplomas represent them to have. And there is every reason to believe that as our own governing boards are always ready to admit to their examinations any foreign medical men who have a respectable foreign diploma, and to modify their examinations according to the value of such diploma, so the French medical authorities will likewise be indulgent to such English candidates as have already obtained a good degree in their own country. It cannot be said, therefore, that the French Government are exacting too much from foreign practitioners desirous of settling in France, or intend to carry the system of protection so far as to altogether prohibit foreigners practising in that country. It is, moreover, to be borne in mind that the principle of free trade has never been carried out on the continent to the extent it has been with us. In Heidelberg, for instance, and other German towns, the number of chemists' shops is restricted by Government, and a medical friend of ours who lived there a few years, informs us that he had the greatest difficulty in obtaining permission to practise, even among his own countrymen. Therefore, had the French law, which has just come into operation, been more exclusive and protective than it really is, it could not be charged with a principle of conservatism that is not to be found elsewhere. But that law does not differ very materially from that which obtains in this country. If a foreigner wish to establish himself as a physician in London, he generally passes some examination at the College of Physicians, or College of Surgeons, and, although there may be no written compulsory law on the subject, we expect him to obtain some English license or diploma, and unless he does so, he cannot be recognised as a legally qualified registered practitioner. Even while we are writing, the Medical Council are issuing circulars to all the Examining Boards, requesting them to inform the Council whether, and under what exemptions, they will admit to their examinations graduates of foreign universities; thus showing that our continental neighbours are not alone in wishing to test for themselves the qualifications of medical men who wish to practise out of their own country.

Besides, it would be acting invidiously and very unfairly to native practitioners, if foreigners were allowed to settle down in some fashionable health-resort, and carry on a lucrative practice (perhaps at the expense of their French *confrères*) without having shown themselves worthy of the confidence reposed in them, and the liberty accorded to them by the French Government. A physician who settles down in a delightful and healthy watering-place, and who—by writing a book in which all the sanitary advantages of the place are dwelt upon in the most glowing terms—attracts to it a large concourse of English visitors, the majority of whom eventually become his patients, must be said (from this point of view) to make a convenience of the place, and to take

the greatest possible advantage of the liberty vouchsafed to him by the French authorities. Under these circumstances, he cannot complain if—with such a prospect before him—he has to undergo the ordeal of a professional examination, and to show that he is something more than an irregular or unlicensed practitioner.

The *Pall Mall Gazette* appears to strengthen their animadversions on the action recently taken by the French Government, by citing a case in which an English student who was not allowed to take part of the necessary hospital instruction in London, notwithstanding he had satisfactorily passed in the French capital the first two years of his studies and examinations. But this only applies to foreign students, and not to foreigners who have already gone through a proper course of studies and hospital practice in their own country, and who have already obtained a licence or degree of an unexceptionable character. As for any English physician being debarred from visiting and prescribing for one of his patients in Paris or at a French watering-place, without first passing the official examinations, we can only say that such a supposition is quite out of the question; nor need we fear that in future either Nice or Mentone, or Pau, or Paris itself will see the influx of English residents in any degree diminished by the operation of this new edict and the scarcity of accomplished and experienced English physicians. Indeed, reasonable (and even liberal) as we have shown the new law to be, it appears that the present French regulations respecting foreign medical men practising in that country are by no means quite settled. According to a full account of the law given in a recent issue of the *Times* by their Paris correspondent, the Minister of Public Instruction is desirous that the question should be submitted to an international commission, which would take into consideration the relative value of the different courses of study pursued in foreign countries, and settle upon certain rules of reciprocity which would work to the mutual advantage of France and other nations.

THE ANTI-VIVISECTIONISTS AGAIN.

We have been favoured with a poetical effort, "The Dog's Appeal," signed J. R., and a tract on Vivisection, being a reprint of a letter of one Morris to the *Record*, with annotations thereon. The verse is well-intentioned, if a little foolish. The tract is a specimen of that sort of deliberate falsehood in which Anti-Vivisectionists, Anti-Contagious Diseases Act fanatics, and Anti-Vaccinationists deal so freely, and which, as it appears, they think they are at liberty to use for the purpose of advancing their views. The letter narrates the vivisection of a dog, described as follows by a medical student, who "did not dare to have his name given:"—

"During a morning lesson a little dog was sent in. It had evidently been a pet. All creatures know when they get into those hells that something dreadful awaits them. The students begged it off. One of them offered to buy it. 'I'll have none of your sentimental humbug,' said ——, in a rage. He seized the wretched animal, fastened it down, tortured it *more excruciatingly than he needed to have done* for the purposes of the lesson, &c., &c."

"This is but an instance, out of *countless thousands* of similar acts which are perpetrated every year in this country by our professors of science, falsely so called."

The following is the commentary on the letter:—

"A young student, to whom a relative expressed her hope that he might not be demoralised and hardened by witnessing or practising vivisection, from which no discovery has ever yet, and never will be obtained to benefit mankind, he replied to her, 'But what can we poor students do? We cannot afford to be plucked again and again, for the Examiners ask us *questions on these very experiments*.'"

Finally, the opinion of the well-known Dr. George Hoggan, is given to the effect that—

"No student can be expected to come forward as a witness (to these atrocities), when he knows that he would be hooted, mobbed, and expelled from among his fellows for doing so, and any rising medical man would achieve professional ruin by a similar course!"

Upon this handbill which, we presume, is but a specimen of many others, we have to observe that, while humanitarians are justified in making use of such facts as they think will prove their case, they are without any excuse when they make public statements which, as a matter of fact, are incredible and, as a matter of testimony, they cannot possibly know anything about. The whole story is plainly a ridiculous exaggeration dressed up by the medical student to suit the sentimentality of the narrator, and it contains four distinct falsehoods which the anti-vivisectionists could have detected if they were disposed to do so. Its writers and disseminators could not possibly know that the dog was tortured "more excruciatingly than was needed for the purposes of the lesson," and the statement is probably untrue. It is a falsehood to say that "countless thousands of similar acts are perpetrated every year;" another falsehood that students are—even as an exception—asked "questions on these very experiments;" and also untrue that "a witness would be hooted, mobbed, and expelled from amongst his fellows."

As we have said, exaggeration may pass unnoticed, but not lying.

PROSECUTION OF QUACKS—MEDICAL AND PHARMACEUTIC.

Some weeks since Mr. Knox, the London magistrate, decided that a quack is not acting illegally if, in calling himself Doctor, which is admittedly in contravention of the Medical Act, he states that he is a doctor of a bogus American college. The decision of Mr. Knox was depended on by a quack named Foulds, prosecuted last week, and it was urged on his behalf that he stated the source of his M.D., and was therefore not liable to punishment. The magistrates, however, did not concur with their London brother, but decided that the quack was in contumacy, and fined him £20 and costs. The point has yet to be settled by the superior courts, and if decided in favour of the medical profession, will very greatly strengthen the 40th section of the Medical Act. If not, an early attempt must be made to amend that miserable abortion of legislation.

In connection with this case we observe that the Council of the Irish Pharmaceutical Society has informed certain petitioners who desired that they might be protected against unlicensed traffic in pharmaceutical products, that they are "not a prosecuting body," and will, in fact,

leave the chemists to fight out the legitimacy of their practice as well as they can. Being aware that the Medical Council had long since adopted this *non possumus* at the instance of Sir Dominic Corrigan, who is also President of the Irish Pharmaceutical Council, we experienced no surprise at this announcement, except that which we shall feel if the pharmaceutical chemists of Ireland submit to such shirking of duty by their own society. By adopting the course which they did, the Medical Council simply escaped an unpleasant part of their functions, and they who were charged by the country with the duty of protecting the public against incompetent practitioners simply refused the trust, and left the public and the profession to the ravages of such harpies. That the prosecution of quacks was and is a part of the business of the Medical Council does not admit of serious dispute, and in our opinion the theory they have hitherto acted upon—*i.e.*, that no part of their funds were applicable to such purpose is an entire fiction concocted for the purpose of escaping responsibility.

The medical profession is obliged to submit because it has no elective control over the Medical Council, but there is no reason why the Irish pharmaceutical chemists should tolerate the shirking of one of the most important functions of their conciliate representatives. They elect their own council, and it is quite open to them to intimate distinctly that they will not vote for the re-election of any of the outgoing members who have joined in the decision to leave the members of the society at the mercy of pharmaceutic quacks. If the members omit to use their electoral privileges they have themselves to blame for the *status quo*.

Notes on Current Topics.

Vaccination from the Scab.

One of our correspondents writing from Queenstown, Ireland, reminds us of a method of vaccination which has never received much encouragement in this country, although it has been extensively employed abroad. Our correspondent goes so far as to say that the protection afforded by vaccination would be much greater than it is if the scabs, which are left by the small-pox pustules, were exercised in performing the operation instead of the fresh or dried lymph. We are also told that, by removing the moist infection, we lessen the virtue and strength of the virus, and that had this method been always adopted in this country we should not hear of such epidemics as that with which we are now visited. This may appear an extraordinary and even absurd statement to those—and they are many—who have never heard of such a plan of vaccination; but, however erroneous such an opinion may be, it, nevertheless, rests upon some basis. So long ago as 1802, Mr. Bryce showed that vaccine-scabs may be used for communicating the disease, and it has been said that this is the most certain mode of transmitting cow-pox to warm climates. It is, moreover, as our correspondent observes, a method that is very generally adopted in America. Dr. Wood, in his *Practice of Medicine*, observes that the scab is certainly efficacious, and is, in his country, almost exclusively employed. He states that he has used it from the commencement of his practice, and remembers only two instances in which he did not succeed with it. One great advantage urged in favour of the scab is, that if properly preserved, it will keep for months, or even for a year or more. To preserve it for a long time it is usual to wrap it up in tin-foil and coat it with wax. When about to be used they should be reduced to a powder, and moistened with a little tepid water. The scab should be umbilicated, of a reddish-brown or garnet colour, translucent, and brittle. Dr. Wood, however, is quite right in saying that in Europe much prejudice exists against the use of the scab, and we doubt whether we shall ever overcome a prejudice which is not altogether an irrational one. It is universally admitted that vaccine-lymph is in its greatest perfection when taken from an eighth day vesicle, and that after that date it deteriorates and becomes less efficacious. We are, therefore, at a loss to account for the success which is said to attend this method, and, at all events, either this success must have been very much exaggerated, or the general opinions respecting the deterioration of the lymph after the eighth day must be an erroneous one. Then again, the scab system of vaccination is certainly a dirty and repulsive one. To vaccinate with matter that is prepared from a scab—and that, perhaps, a dirty one—is not so clean and innocent in appearance as the clear limpid and transparent lymph taken from a vesicle. We are surprised that this plan is popular in America, and it is evident that they have no "anti-vaccination league" in that country. Were we to attempt to introduce this practice into England we should expect to see vaccination put a stop to altogether.

A Good Example from Dublin.

Some time ago we had occasion to notice the zeal which the authorities at Birmingham have shown in taking advantage of the Artisans' Dwellings Improvement Act, and the great improvement that has within the last few years taken place, in the sanitary and social condition of that great town. We are now glad to find that Dublin has been one of the first towns to follow suit in this great work of ameliorating the sanitary condition of the working classes. In a speech which the Recorder of Dublin recently delivered to the grand jury of his court, he announced that St. Stephen's Green would be in future preserved as an ornamental garden for the recreation of all classes; and, what is still more gratifying, that the municipal authorities had resolved to carry out important sanitary improvements, in accordance with the provisions of the Act above mentioned. They propose commencing at once with two of the twelve areas which have been condemned by Dr. Mapother as incapable of being put into a proper condition, except by "comprehensive reconstruction," and probably it will not be long before all the other objectionable districts of Dublin receive the same attention from its municipal authorities, and the whole town be made as healthy as any in England. Besides when the chief metropolis of a country leads the way in any great sanitary movement, it is generally found that other smaller towns follow the good example that has been set them; and therefore, there is every reason to expect that before many years have elapsed, the improvement in the sanitary state of the Irish people will be as

great as that which has taken place in their social condition.

How Contagion is Spread.

THE following very pitiable case is only one of many that have recently occurred to show how difficult it is to prevent the spread of infectious diseases, and how easily the source or media of infection may escape detection. Mary Woodward, married, residing in New Street, Lambeth Walk, was summoned by John Baxter, one of the inspectors of nuisances for the parish, with having transmitted without disinfection, two blankets, which had recently been exposed to an infectious person suffering from the small-pox. Mr. Baxter stated that on the 19th ult., in consequence of information, he went to No. 3 New Street, East Street, Lambeth Walk, in the occupation of the defendant and her husband. He found one of the children suffering from small-pox, and after giving certain necessary directions, gave defendant a copy of an extract from the Public Health Act of 1866. About seven o'clock the same evening the husband of defendant informed witness that his wife had taken two blankets to a pawnbroker and pledged them. Witness immediately proceeded to the pawnbroker's named, and found two blankets had been pledged by the defendant. They were on the dust-hole in the back-yard. He disinfected them. He afterwards spoke to the defendant as to why she had pledged the articles without disinfecting them, and she said she had done it to get food. Witness told her that would not justify her in spreading the disorder wholesale in such a manner. She refused to give him the pawn tickets, and told him to get the blankets as best he could. Witness took the blankets out of pledge, and again had them disinfected. Mr. Ellison said the reason given was not sufficient for her spreading infection over the whole neighbourhood. If her story was true with regard to her husband, and being without food, he could not but commiserate her condition, but he could not shut his eyes to the fact that she had committed a most serious offence. No plea of hunger could be accepted for such conduct, and although he did pity her, he must consider the duty to the public he had to perform. He must, therefore, to check such a practice, impose the fullest penalty the law allowed him, viz., £5, or two months' imprisonment. The defendant said she was pleased at the decision, and thanked his worship, as she would be away in prison from her husband's ill-treatment. In this case it is evident that, but for the confession of the husband, nothing would have been heard of these blankets, other articles of clothing would have contracted the contagion, and when some weeks, and even months afterwards, their owners were attacked with small-pox, the wonder would have been how they could have caught it, considering, perhaps, they had never been anywhere near a small-pox patient. Unfortunately, a great deal of ignorance of the law on this subject exists among all classes of society, and our sanitary authorities could not take a better step than that of leaving at every house, especially in the poorer districts, and among laundresses, needlewomen, tailors, &c., a copy of an extract from the Public Health Act.

Progress of the Small-pox Epidemic in London.

THE deaths from small-pox, which had been 75, 97, and 75, in the three preceding weeks, rose last week to 116, the highest weekly number during the present epidemic; 45 were certified as unvaccinated, 40 as vaccinated, and in the remaining 31 cases the medical certificates did not furnish any information as to vaccination. The 116 fatal cases included 47 in the Metropolitan Asylum Hospitals at Homerton, Stockwell, and Hampstead, 5 in the Highgate Small-pox Hospital, 2 in the North-street Infirmary (Poplar), 1 in an ambulance, and 1 in the House of Correction; the remaining 60, or 52 per cent. of the total cases, occurred in private dwellings. The Metropolitan Asylum Hospitals contained 859 small-pox patients on Saturday last, against numbers increasing steadily from 185 to 823 in the ten preceding weeks; about 200 cases were necessarily refused admission during the week, all the available beds being occupied.

The Metric System in Prescribing.

THE Medical Society of the county of New York has passed a resolution strongly recommending to the profession the adoption of the metric system for their prescriptions. The resolution was adopted without a dissentient voice, and it will probably have much influence in New York. The following simple instructions are given in a New York journal, by which prescribers may readily change their formularies:—

Physicians heretofore accustomed to the old system need not be discouraged by any seeming difficulty. It is not by any means necessary to pedantically translate one system into the other. The rule is to choose the *nearest round number ending in* 0 *or* 5, excepting in the case of very potent remedies. Indeed, by remembering the following two simple rules, the translation becomes exceedingly easy:—

1. In prescribing the equivalent of *drachms or ounces*, *multiply the number of drachms with* 4, and round off the product.

Reckoning a gramme equal to 15 grains, which is in practice correct enough, we would therefore write instead of ℥ss: 2·0 gm.; for ℥i: 4·0; for ℥i ℥ss: 6·0; for ℥ii: 8·0; for ℥ss: 15·0 (rounded off); for ℥i: 30·0 (instead of 31·1).

2. In prescribing the equivalent of *grains*, *multiply the latter by* 6, and round off the product, which is the corresponding quantity in *centigrammes*.

3 grains: 3 × 6 = 18, rounded off 20 ctgrm., or 0·20 gm.
4 grains: 4 × 6 = 24, rounded off 22 ctgrm., or 0·25 gm.
10 grains: 10 × 6 = 60 (instead of 66), or 0·60 gm.

The main attention is to be directed to the preservation of the *relative* quantities of the ingredients in a prescription, and besides, to the fact that liquid medicines, if prepared by weight, and dispensed (as they always will be) by measure, must be adjusted in such a manner that the active ingredient, if its specific weight is much different from that of water, be not prescribed in too large or too small a dose. Of heavy liquids a larger weight, and of light liquids a smaller weight will be required to fill the same measure.

2 fl. ℥ of chloroform weigh nearly 3 ℥ in weight; hence,

in prescribing a heavy liquid like chloroform in the metric system, regard must be had to its specific gravity. The same is the case with liquids lighter than water, as for instance spiritus ætheris comp., of which 1 fl. ʒ weighs only about 40 grains.

The capacity of the ordinary domestic measures, as compared with the metric system, is as follows :—

A wineglassful is equal to about 3 fl. oz., or 100 gm.

A tablespoonful (℥ ʒ) corresponds to 15 gm.

A teaspoonful (1 ʒ) corresponds to 4 gm.

A teaspoonful of vegetable powder is about equal to 15 to 20 grains, or 1 to 1·5 gm. ; and of a mineral or saline powder about 30 to 40 grains, or 2 to 3 gm.

A noticeable exception is calcined magnesia, which is often prescribed to be measured in such a manner; this substance occupies a bulk about six times as large as an equal weight of sugar ; one teaspoonful of the latter weighing 2·0 gm., the same measure of magnesia weighs only about 0·3 gm. (or 5 grains).

The Population of the Twenty Large English Towns in the middle of 1877, as estimated by the Registrar-General.

Population being the basis of all calculated vital statistics, it is of the first importance that trustworthy information as to the numbers of the people should be available. As censuses, or enumerations of the people, are in very few places held more frequently than once in five years, and in the United Kingdom only once in ten years, it is necessary to adopt some system by which approximate estimates of the populations, in the years which intervene between the censuses, may be framed as a basis for mortality and other statistics.

The Registrar-General, unless exceptional circumstances are brought under his notice by local authorities in proof of an abnormal rate of increase or decrease, is under the necessity of adopting the most approved mode of estimating populations in each year between the decennial census enumerations, by assuming that the rate of increase which prevailed during the period between the last two censuses, has been maintained since the most recent enumeration. The census in 1871 proved that this method had produced approximately accurate estimates of the population of England and Wales, of London, and of the different registration divisions and counties in the several years of the decade 1861-71. In many towns, however, the rate of increase in one decade does not afford a reliable indication of what it will be in the next ; hence, in towns, more frequent enumerations are urgently needed, in order that the public confidence in sanitary statistics may not be weakened by distrust of the approximate accuracy of population estimates.

The estimated population of the twenty large English towns, dealt with in the Registrar-General's returns, of which we furnish our readers with a weekly summary, is calculated at 7,055,612 in the middle of 1877, showing an increase of 101,973 or 1·5 per cent. upon the estimate for 1876. During the year 1876 the excess of births over deaths in these twenty towns, including London, was 101,505, and 17,980 more than in 1875.

The estimated population of Registration London in the middle of 1877 is 3,533,484, and exceeds by 11,356 the estimated population of the nineteen provincial towns The estimated increase of population in London between the middle of 1876, and the same period of 1877 is 44,056, and 5,548 less than the excess of births over deaths during 1876. A portion of the natural increase to the population of inner London now flows over its borders into the outer ring of suburban districts. The estimated population of the London outer ring in the middle of 1877 is 834,063, and 36,884 more than the estimate for the middle of 1876.

After London, Liverpool is the largest town in England and Wales, with an estimated population of 527,083; Manchester and Salford together are credited with 500,397, and Birmingham with 377,436 inhabitants. The populations of Leeds, Sheffield, and Bristol range between two and three hundred thousand ; that of seven towns between one and two hundred thousand. In the five other towns the population is less than a hundred thousand, the smallest town in the list being Plymouth, with 72,911 inhabitants. The calculated rate of increase of population in these several towns between 1876 and 1877, based upon the ascertained rate of increase between 1861 and 1871, varies to a marked extent ; it was equal to but 4 and 7 per 1,000 in Manchester and Norwich, whereas it ranged upwards in the other towns to 26 in Sheffield, 32 in Bradford, and 34 in Leicester. In Birmingham, the excess of births over deaths was greater by 1821 than the estimated increase of population ; in Sheffield, however, the estimated increase is greater by 2,595 than the excess of births over deaths in 1876.

"Married off the Strength."

The case of Mary Webster has called forth a great deal of sentiment, much of which is misplaced. Women "off the strength" know perfectly well that the proper person to apply to for medicines or medical attendance is the parish doctor. They are not recognised in the army, whose mobility and efficiency is already seriously affected by its married *impedimenta*. It is not long since a regiment arrived in Dublin with some three hundred women and children. The soldier married "on the strength" receives every indulgence in the shape of special hospitals, medical comforts, medicines, and medical attendance, and under recent arrangements special medical officers. To relax the very salutary rules now enforced would be to open a door to much abuse, and necessitate at the same time a very large increase in the medical and corresponding staff of the army, which a sentimental public might object to when it took the shape of an increased estimate for the medical department, whose cost is so terribly troubling to the economists of the day.

Invalidity of Insurance in Case of Death by Abortion.

The Mutual Insurance Company of New York has just tried out this question. In 1871 the Company issued a policy on the life of a woman who died in consequence of a miscarriage produced by an illegal operation performed upon her. The Company refused to pay the money, and the case was carried to the Superior Court, whence it went to the Supreme Court, which has just given the following decision : "The voluntary act on the part of the assured,

resulting in her death, was of such a character as to preclude the defendants from assuring against the consequences.

Another Fourpenn'orth of Doctoring.

A CONTEMPORARY publishes the following handbill :—

"Self-supporting Dispensary, 72 Worship Street. — Mr. Timothy, L.R.C.P. Lond., L.M.R.C.S. Eng., M.R.C.S. and L.S.A.—Charge fourpence in the morning and sixpence in the evening. A visit to any dispensary patient, within a radius of a mile, before three o'clock in the afternoon, *one shilling*."

On referring to the "Medical Directory," our contemporary finds that P. Vincent Timothy really possesses the qualifications mentioned, and, curiously enough, is the author of "Advertising Propensities of the Medical Fraternity."

Swearing to his own Idiocy.

At a recent will trial in Ohio the defendant, says a New York contemporary, swore that at the time he executed the instrument he was "idiotic and of weak and unsound mind." This is the first case on record in which this very common explanation concerning one's idiocy was ever sworn to. Generally, however, this is not necessary.

Medical Microscopical Society of London

WE are requested to mention that the meeting of this Society will be held in future at the Century Club, 6 Pall Mall Place, W., commencing with the Annual General Meeting on Friday next at 8 p.m.

War-Office Sanitation.

THE War-Office, already distinguished by its medical policy, has achieved sanitary distinction in the London police courts. Last week the summonses taken out by the sanitary authority of Bethnal Green against the owner of the Militia Barracks, requiring the premises to be put in repair and made fit for habitation, came on for hearing. The state of the buildings, it appeared, was such as to render them a nuisance and injurious to health. The worst part of the buildings was, it seemed, the bed-rooms and dwelling-rooms. These were arranged with a sink, the open pipe of which had a direct communication with the common sewer, and, as a consequence, effluvia therefrom mounted into the rooms. The barrack yard and hospital were also in a bad state, and it was stated that there had been several cases of fever and disease among the men of the regiment—the Tower Hamlets Militia. A gentleman said that he appeared as solicitor for the War Department. When the summons was applied for no doubt the magistrate was not informed that the barracks were Government property. Had that been done the summons would probably not have been issued, for it had been decided by no less an authority than the Lord Chief Justice of England, *that the Crown was not bound by the provisions of an Act of Parliament unless such was expressly named therein.* The solicitor, however, felt it right to say that there was no wish on the part of the Government to do anything but what was right and necessary, and matters were now being proceeded with at the barracks. What a confession for a public department! and what a plea for the Government to put in! The War-Office had continually and persistently ignored remonstrance, and neglected the commonest sanitary duties, for infraction of which the law would have punished a subject, and had forced upon the parish the necessity of going to law with it, which being done, it pleads that it is not bound by any law, and cannot be submitted to a penalty. Such a plea is analogous to the plea of statute of limitations against a just debt, and is more discreditable to the department than the admission that they had waited until law-process compelled them before remedying the barrack nuisances.

PROF. MOLESCHOTT, of Turin, has been made a Senator of the Italian Kingdom, a distinction doubly appreciated by a German *savant* who has so identified himself with the interests of Italy. The students presented a congratulatory address to the Professor.

IN a bog in the Co. Monaghan, a very fine and perfect specimen of the elk was discovered lately. The skeleton is complete, every bone being forthcoming. Not an antler is broken, although they measure seven feet six inches across. The animal stood about six feet high, and is perhaps the best specimen in Ireland.

Correspondence.

THE NEW PUBLIC HEALTH BILL.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—As there would seem to be a general concensus of opinion that the forthcoming Health Bill will very likely give the consulting officers greatly increased powers in each union, permit me to suggest that these officers should, as a condition of *ex-officio* appointment, undergo :—

1. A special training of three months.
2. Should pass after that a special examination in hygiene.
3. Should agree to surrender their entire private practice, if at any time required to do so by the Local Government Board.
4. They shall be paid entirely out of the Consolidated Funds.

No untrained official ought to be appointed. It would be unjust that the present officers should be suspended without giving them an alternative.

Yours, &c.,
SANITARIAN.

ANIMAL VACCINATION IN THE UNITED STATES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Talking recently, in Boston, with Dr. C. R. Drysdale about vaccination, I referred to the fact that lymph from the heifer was generally used in Massachusetts. He said that your readers would doubtless be glad of a few facts in regard to it. Before coming to England I was connected with one of our largest State institutions. The laws of the State oblige us to vaccinate all who are admitted (within twenty-four hours) who have not been recently vaccinated, or have had small-pox; also children born at the institution. For five years at least we have used lymph from the heifer, which we obtain from Dr. Henry A. Martin and Sons, of Highland District, Boston. The lymph is sent to us by post, on ivory points, done up in cotton wool and oiled silk, or something of the kind. We pay either eight or ten shillings (two dollars, or two, fifty cents), I am not sure which, per dozen. We simply scarify the arm, and rub the point on the little places.

Each side of the point is charged with lymph, and one point often answers for two arms, using one side for each arm. When quite positive that a child is healthy, we sometimes use the lymph from its arm, but not after passing through a second. Dr. Martin and Sons are always very happy to answer any questions with regard to this lymph. I have called on them sometimes to procure it, and have found quite a room-full waiting while a son had gone to their farm for a fresh supply. Besides the points, they have the lymph in an air-tight glass tube, and they supply crusts (all from the heifer), but they unhesitatingly recommend the points as best. Dr. Martin and Sons also do quite a business in vaccinating people at their office.

Children wishing to enter our public schools must obtain a physician's certificate of vaccination.

Yours obediently,

H. MARSH, M.D.,
Boston, Mass., U.S.

London, January 11th, 1877.

HALF-PAY AFTER TEN YEARS' ARMY SERVICE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly inform me in your next issue on the following :—An army surgeon of over ten years' full pay service is placed on half-pay through ill-health. Should he be called back on full-pay at the end of two years, would he necessarily at once be made surgeon-major, his twelve years having been completed? Or would he have to make good the time he had been on half-pay?

I am, Sir, your obedient servant,

HALF-PAY.

[Half-pay does not count towards twelve years' full-pay service in the army, the number of years of active service necessary for promotion.—ED. M. P. & C.]

THE MEDICAL DEFENCE ASSOCIATION AND UNQUALIFIED PRACTITIONERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—The Medical Defence Association has opened a campaign against illegal practitioners with perseverance and vigour, and I trust that it may be enabled to carry on its warfare with further success. This will no doubt depend upon the *commissariat*, and their having the sinews of war in the shape of funds.

This is the first combination that has fairly grappled with the evil, and it fully deserves the practical support of the whole profession. This crusade against men who usurp the function of the physician *outside the pale of the profession* is a laudable one, but it will still better serve our interests and elevate our dignity when it is dedicated to internal reform, and when the practice of visiting and prescribing by unqualified men under the sanction of Fellows and Members of our colleges also comes under its notice.

I believe the time has now come to strike a blow at an evil that has developed in our midst in spite of protestations and in defiance of all the laws that have been framed for our own protection. I need hardly say I allude to the practice of employing *unqualified* medical assistants. It is a well-known fact, and we cannot disguise it however much we may desire to do, that there are numbers of men practising our profession who have never undergone a course of medical education or training, and who have less claim to practise than even any one of those whom the Medical Defence Association has already prosecuted.

It becomes a grave question whether we have not ourselves to blame for the existence of quacks by our own toleration within our own ranks of both the old and young men who have never taken out the necessary qualifications required by the laws of our country. It was clearly the intention of the legislature when it granted the Medical Act that none but those who had passed a proper examination and obtained a license should either visit or prescribe.

It would be trivial to enter into the reasons that induced Government to pass such a wise and beneficent law. It is a matter of regret that we have been so forgetful of our own interests and rights that the intention and object of this Act are defeated, and that the law is openly violated, daily and hourly, in every part of England.

I hear it often said that we have a superfluity of medical men, and that the profession is overcrowded. I believe this to be a fallacy. I grant that our ranks are swelled to an inordinate degree by those who have no legitimate connection with us, but that the number of properly-qualified practitioners is in excess of the requirements of the age I deny *in toto*.

It remains for younger members of our profession to take up and ventilate the subject, for it presses with the greatest injustice and severity upon them.

Ireland can teach us a lesson in these matters, as she neither descends to *fourpenny* practice nor tolerates *unqualified practitioners*.

Fas est et ab hoste doceri.

Yours faithfully,

AN ENGLISH PRACTITIONER.

January 13th, 1877.

NOTES FROM OUR EXCHANGES.

"MEDICAL AND SURGICAL REPORTER."

IN the treatment of inflammation of the nervous centres and their appendages, as it occurs in infancy, H. Nye, M.D., Enon Valley, Pennsylvania (Sept. 30th, 1876, page 268), advocates the use of nauseating doses of verat. viridi, hydrate of chloral, and blisters applied to the whole length of the spine, in conjunction with warm bathing, attention to the condition of the bowels, stomach, and gums, worms, and other sources of irritation.

The verat. viridi depresses the heart's action, and diminishes the pulse from 150 to 120, or 70 per minute, and consequently diminishes active inflammatory action. Care must be taken not to push its administration too far, owing to the severe prostration it induces. The blister applied to the spine should be an inch to an inch and a half in breadth.

Posture in Heart Disease.—Dr. Gueneau de Mussy, in a communication to the *Gazette des Hôpitaux* (*Medical and Surgical Reporter*, page 274), points out that one of the most frequent functional signs of cardiac affections is the difficulty that patients experience in preserving the horizontal position during sleep, generally requiring to have the head raised by several pillows. Some, however, do prefer the lying down posture, and these are generally cases of aortic insufficiency. Dr. Gueneau de Mussy's explanation of this fact is as follows :—"When the aortic orifice, incompletely closed by its valves, permits a reflux of blood to the ventricle, the reflux is accomplished under the double influence of the weight of the blood column and the contraction of the aorta. The first of these influences acts to its full extent in the vertical position of the trunk, and is almost annihilated in the horizontal, so that suppressing one of the co-efficients the inconveniences of the lesion are lessened, and a relief produced which instinctively makes the patient seek the horizontal position.

It is otherwise in lesions of the auriculo-ventricular orifices; the vertical position of the trunk renders the reflux of blood into the auricle less easy, and is instinctively chosen by the patient.

Pulling at the Placenta.—A Dr. Zyer, of Peterculter, condemns strongly the habit of dragging in the placenta to aid in the expulsion of the latter. He advocates a period of rest after delivery of the child has taken place, during which, unless there are symptoms of flooding, the uterus should not be grasped, or subjected to pressure. He finds that when allowed to come by the natural efforts of expulsion, the edges of the placenta come first, it being doubled and folded upon itself always in the length and direction of the passages.—(August 26. 1876, page 176.)

Dispersion of Ovarian Cysts by Electricity.—Dr. J. W. von Ehrenstein, of Dresden, has contributed an article to

the *All. Med. Central Zeitung* of June and July, in which he claims remarkable success in the treatment of ovarian cysts by the employment of electricity. (*Med. and Surg. Reporter*, August 26, page 176.)

Cases of Removal of the Spleen.—M. Péau, at the meeting of the Académie de Medicine (*Bulletin*, No. 29), on the 18th of July, exhibited two patients upon whom he had successfully performed ablation of the spleen, in consequence of large tumours of the organ. The health of both patients was very good at the time of exhibition. One of these cases had been operated upon, as far back as 1867; his health during the interval has been excellent. (*M. S. Reporter*, Sept. 23 1876, page 253).

ROTUNDA HOSPITALS.

At a meeting of the Board of Governors of these hospitals, held on the 12th inst., Wm. Hume Hart, M.B. & M.Ch. Dub., was appointed Assistant-Physician in the room of Dr. A. V. Macan, whose term of office had expired. On the same occasion the following vote of thanks was unanimously adopted :—

Resolved—"That the thanks of the Board are due, and are hereby given, to Dr. A. V. Macan for the zealous and efficient manner in which he discharged his duties as Assistant during his term of office, and for his kindness and attention to the patients."

The King and Queen's College of Physicians in Ireland has made arrangements for courses of lectures to be delivered in their College Hall on six successive Mondays, commencing with the 22nd of this month. The first lectures will be two of Professor Emerson Reynolds's on "The Influence of Chemical Constitution on Physiological and Therapeutical Action." He will be followed by Professor Macalister, the subject of whose lectures will be "The Development of the Muscular System in Vertebrates," and "The Intestinal Canal in Man and in the Higher Animals." Dr. Foot will conclude the series with two addresses on "Tuberculosis." The arrangements of admission are stated in our advertising pages.

Obituary.

ALFRED SMEE, F.R.S., F.R.C.S.

It is with much regret that we have to announce the death of Mr. Alfred Smee, at the somewhat early age of fifty-eight. Mr. Smee was the son of a gentleman who held the office of chief accountant of the Bank of England. At an early age he exhibited a liking for scientific pursuits, and when he left school, commenced the study of chemistry, with the view of becoming a chemist; subsequently, the course of events found him the hard-working apprentice of a general practitioner. In 1840 he obtained the diploma of the College of Surgeons; and in 1853 he was elected a Fellow. Mr. Smee was for a time connected with the Aldersgate School of Medicine, where he lectured on Surgery. Subsequently he became Surgeon to the Royal General Dispensary, and on his retirement from this, devoted himself to eye practice. Early in life he married a lady, who brought him a considerable property, and his father's influence obtained for him the appointment of surgeon to the Bank of England. Although he retained his house in Finsbury Circus, he spent the greater part of his days at his country residence in Surrey, described in a book known as "My Garden." In this volume the botanical, zoological, and geological features of interest, not only of his garden, but of the surrounding neighbourhood of Beddington are given and illustrated with considerable care and minuteness. At the early age of twenty-three he was elected a Fellow of the Royal Society for his researches on electro-metallurgy and a very useful and economical battery devised by him, still bears his name. Mr. Smee, being independent of his profession, and free from the drudgery of practice, devoted himself with considerable ardour to scientific book-making. He took up with Electro-Biology, and wrote a book upon it; he investigated the potato disease, which he wrongly attributed to an aphis. This soon brought a book on "The Potato Plant, its Uses and Properties." "Instinct and Reason" next engaged his attention; this was followed by "The Properties of Thought adapted to Words and Language," both of which are devoid of that solid material which is calculated to make the writings of the man of science remembered when he shall have passed from among his fellows. He is said, however, to have devised the present system of printing Bank of England notes; and among his professional writing his book on "Vision in Health and Disease" may be said to possess considerable merit. He aspired to sit in Parliament; and although he had neither a voice to impress the multitude nor powers of oratory, he valiantly stood two contested elections for the city of Rochester, but on each occasion failed in the object of his ambition.

Medical News.

Vital Statistics.—From the Registrar-General's reports we learn that during last week 6,211 births and 3,673 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,538. The mortality from all causes was at the average rate of 24 deaths annually in every 1,000 persons living. The annual death-rate was 25 per 1,000 in Edinburgh, 22 in London, 32 in Dublin, and 26 in Glasgow. In the other large towns the rates were—Plymouth 19, Portsmouth 21, Nottingham 21, Sheffield 20, Bristol 21, Leicester 21, Norwich 14, Brighton 24, Sunderland 28, Birmingham 22, Leeds 22, Wolverhampton 23, Hull 19, Oldham 20, Manchester 29, Salford 30, Bradford 22, Liverpool 27, and Newcastle-upon-Tyne 29. The annual death-rate from the seven principal zymotic diseases averaged 3·6 per 1,000 in these towns. No death from these seven diseases was registered in Norwich, whereas the zymotic rate was equal to 5·1 in Manchester and 7·4 in Salford. The deaths referred to small-pox were 146, against 125 and 104 fn the two preceding weeks; 116 occurred in London, 22 in Liverpool, 6 in Salford, 2 Manchester, and not one in any of the sixteen other large towns.

Liverpool Medical Institution.—At the annual meeting of the Liverpool Medical Institution held on the 9th inst., the following office-bearers were elected :—President, Dr. James Turnbull. Vice-Presidents—Dr. Glynn, Dr. Lyster, Mr. Higginson, Dr. William Carter. Treasurer—Dr. Dickinsou. Hon. Secretary—Dr. Caton. Hon. Secretary of Ordinary Meeting.—Mr. Chauncy Rurzey. Hon. Librarian—Dr. Campbell. Members of Council—Dr. Adam, Dr. Armstrong, Dr. John Cameron, Dr. Pollard, Dr. Rawdon, Mr. George H. Snape, Dr. Alexander, Dr. Braidwood, Dr. T. D. Chalmers, Dr. Finegan, Mr. McCheane, Dr. Samuels. Microscopical Committee—Dr. Braidwood, Dr. William Carter, Dr. Caton, Dr. Davidson, Dr. Glynn, Dr. Lupton, Mr. Newton, Mr. Rushton Packer. Auditors—Dr. Adam and Mr. Frederick W. Lowndes.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader "Subscriber," "Old Subscriber," &c. Much confusion will be spared by at ention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

OUR attention has been called to the conduct of two Poor-law Medical Officers in Ireland which, if the circumstances be truly reported to us, is disgraceful and dishonourable in the highest degree, and such as to disentitle them not only to professional recognition, but to association with any gentleman. One of these practitioners is stated to have obtained his election to a district in the south of Ireland by means of the influence of the preceding medical officer who had resigned. He received that influence upon the faith of a solemn promise by him that his tenure of the dispensary was to be considered as only temporary and that he would resign the office when requested to do so by the medical officer who had exercised his influence to secure the election. That promise was not merely a verbal one—which might have been considered sufficiently binding between gentlemen and brother practitioners—but was reduced to writing, and is now extant in the form of a perfectly explicit letter of undertaking. The circumstances which were to terminate this person's temporary tenure of the dispensary having arisen, he was called upon to fulfil his pledge and resign, upon which, by letter, he announces the fact that he has possession of the district and means to hold it in spite of any promise he may have given to the contrary.

The second instance is that of a medical officer who has accepted an office in defiance of his own written guarantee that he would not do so. A sanitary appointment in a northern county—which had been held by the former occupant at a nominal salary, having become vacant, the medical practitioners within the union met together to consider the course to be pursued, and decided not to accept the office except at an increased remuneration. This determination was expressed perfectly, explicitly, and without any condition in the form of a resolution which all the practitioners then and there signed. For twelve months the office remained vacant, during which time the guardians exhausted every effort to procure a cheap doctor. At length they found one suitable to their views in the person of one of the practitioners whose signature at this moment testifies against him on the face of the resolution. Without notice to his medical brethren, or apology of any sort, this person accepts the office.

The conduct of these practitioners cannot be passed over in silence, but we hesitate to name them or produce the written records which are before us, hoping that some satisfactory explanation or *amende* may be made by them. We await some such communication which we hope may relieve us of the necessity of warning the profession at large against those who might be capable of such proceedings as are here indicated.

A USEFUL INSTITUTION.—A correspondent sends us the fifth annual report of Mrs. Hilton's Crèche, at Stepney Causeway, from which we learn that there are about 150 children in the establishment whose wants and ailments are attended to while their mothers are at work. Mrs. Hilton's praiseworthy endeavours to mitigate the sufferings of the little ones merit every encouragement. The balance-sheet shows an income for the past year of about £700, while the expenditure was kept within the income. The Princess Christian, who is patron of the Institution, has promised her kindly assistance to a bazaar, which is shorty to be held on the premises, in aid of its funds.

THE RAINFALL OF 1876.

MR. STEWARD, Optician to the National Rifle Association, sends us the following statistics which were taken at his Observatory:—

1876.	Inches.	Number of days on which rain fell.	1876.	Inches.	Number of days on which rain fell.
January ..	0.58	5	July	0.57	6
February ..	1.90	15	August ..	1.93	10
March ..	2.54	15	September ..	2.00	21
April	1.35	8	October ..	1.88	12
May	0.87	5	November ..	2.59	15
June	1.02	7	December ..	5.86	21
Total ..	8.26	55	Total ..	14.83	85
Total for the year ..	23.09 inches ..	140 days.			

Rain also fell on the first twelve days of the present month, amounting in the aggregate to 3.40 inches, which is already terribly in advance of the whole of January and February last year.

VACANCIES.

County of Louth Infirmary.—House Surgeon. Salary and other particulars to be obtained on application to the Secretary. (See Advt.)

County of Louth Gaol.—Surgeon. Particulars as to Salary, &c., to be obtained of the Secretary, Dundalk. (See Advt.)

Great Northern Hospital, London, N.—House Surgeon, and an Aural Surgeon. Full particulars of the Secretary.

Newcastle-on-Tyne Dispensary.—Resident Medical Officer. Salary, £200, with residence. Address the Hon. Sec., Grange Street, West, Newcastle.

East Riding Lunatic Asylum.—Medical Superintendent. Salary, £350, with furnished house. Applications to the Clerk to the Committee of Visitors, Beverley.

Cambridge, Addenbrooke's Hospital.—House Physician. Salary, £65, with board and lodging. Also a Dispenser. Salary, £100, with dinner daily. Applications to the Secretary.

Birmingham Midland Free Hospital.—Extra Acting Physician. Honorarium. £60 per annum. Applications to the Medical Committee, Children's Hospital.

Hastings Union.—Medical Officer for the second District. Salary, £85, with extra fees. Applications to the Chairman of the Board of Guardians, Hastings.

St. George's Dispensary, London, W.—Second Surgeon. The Resident Medical Officer will furnish all necessary information.

APPOINTMENTS.

BENT, J. F. V., M.D., Medical Officer and Public Vaccinator for the No. 2 District of the Risbridge Union, Suffolk.

BETTANY, G. T., B.Sc., Lecturer on Botany at Guy's Hospital Medical School.

BOULTON, G. S., L.R.C.P.Ed., M.R.C.S.E., Medical Officer for No. 9 District of the Lincoln Union.

BRIDGES, Dr., an Assistant Physician to the Hospital for Sick Children, Great Ormond Street, W.C.

BROWNE, W. J., L.R.C.P.Ed., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Church Hill, co. Donegal.

CALLAN, M., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Castlebellingham, co. Louth.

CLARK, F. C., M.R.C.S.E., Assistant Medical Officer to the Suffolk Lunatic Asylum, Melton.

DAVIES, Mr. H. H., House Surgeon to the Flintshire Dispensary, Holywell.

DUNCAN, A. T., L.F.P.S.G., Assistant Medical Officer to the Joint Counties Lunatic Asylum, Carmarthen.

FOX, Dr. CORNELIUS, Medical Officer of Health for the Central, Eastern, and Southern Divisions of the County of Essex.

HUGHES, Mr. J. E., Medical Officer and Public Vaccinator for the Llanfihangel District of the Aberystwith Union.

KEMPE, Mr. J. A., Junior House Surgeon to the Hospital for Sick Children, Great Ormond Street, W.C.

KIDD, H., L.R.C.S.I., Medical Officer, Public Vaccinator, &c., for the Tullow Dispensary District of the Carlow Union.

LEWIS, J. R., M.B., C.M., Resident House Surgeon to the Bristol Hospital for Sick Children.

LLOYD, M., L.R.C.P.L., M.R.C.S.E., Medical Officer of Health for the Conwil District of the Carmarthen Rural Sanitary District.

MATHESON, F., M.D., C.M., Assistant Surgeon to the Royal Dispensary for Diseases of the Ear.

MEDWIN, A. G., M.D., M.R.C.S., L.D.S., L.R.C.P.L., Surgeon to the Dental Hospital of London.

NICHOLSON, W. R., M.R.C.S.E., Assistant Medical Officer to the North Riding Lunatic Asylum, Clifton, Yorkshire.

ORMSBY, J., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer for the Lower Mitton District of the Kidderminster Union.

POLLARD, F., M.D., Assistant Physician to the Liverpool Infirmary for Children.

PRITCHARD, U., M.D., F.R.C.S., Senior Surgeon to the Royal Dispensary for Diseases of the Ear.

STUDDERT, J. M., L.R.C.P.Ed., L.R.C.S.Ed., Medical Officer, &c., for the Carrigaholt District of the Kilrush Union, co. Clare.

SUTTON, F., M.R.C.S.E., Medical Officer of Health to the Rural Sanitary Authority, Gainsborough Union.

SWETE, H., M.D., Public Analyst for Worcestershire.

TAYLOR, H. E., M.R.C.S.E., an Assistant Resident Medical Officer to the Leeds Public Dispensary.

WARNER, F., M.D., M.R.C.P., Medical Registrar to the London Hospital.

WARNOCK, H. T., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Medical Attendant to the Royal Irish Constabulary, Ballintra, co. Donegal.

WATSON, C. S., M.B., C.M., Resident Medical Officer and Secretary to the Bournemouth General Dispensary and Cottage Hospital.

Marriages.

SECCOMBE—SCARNETT.—On the 11th inst., at Angell Town, Brixton, George Samuel Seccombe, L.R.C.P. Lond., M.R.C.S. Eng., to Martha Elizabeth, only child of the late W. H. Scarnett, Esq., of Brixton.

Deaths.

BEWLEY.—On Jan. 4, at Kingsland Road, Charles Bewley, M.R.C.S.E., aged 56.

MERCER.—On Jan 1., at the East Riding Asylum, Beverley, N. G. Mercer, M.D., Superintendent, aged 35.

PUGH.—On Dec. 31, at Camberwell House, after a short illness, Edgar Joseph Pugh, M.R.C.S., L.S.A., Assistant Medical Officer of Camberwell House Asylum, aged 35.

SHARP.—On Jan. 4, suddenly, at Cullen, Scotland, Hugh Sharp, A.M., M.R.C.S.E., aged 66.

SILLAR.—On Jan. 3, at his residence, Bath House, Sydenham, Zechariah Sillar, M.D., and J.P. for the county of Lancaster, aged 81.

SMEE.—On Jan. 11, at his residence, Finsbury Circus, E.C., Alfred Smee, F.R.S., F.R.C.S., Surgeon to the Bank of England, aged 58.

TAYLOR.—On Dec. 24, at Uttoxeter, Herbert Taylor, M.D., aged 26.

THOMSON.—On Dec. 17, at St. Andrews, Andrew Thomson, M.D., aged 81.

WIDDUP.—On Dec. 14, on board the Royal Mail Steamer *Paria*, Wm. Cæsar Sutton Widdup, M.D., L.R.C.S.I., eldest and beloved son of John Widdup, M.D., of Penzance, co. Wexford.

WINZAR.—On Dec. 23, John Winzar, M.R.C.S., L.S.A., Medical Officer of Health for Salisbury, aged 71.

Pathological Anatomy of the Brain— LOCALISATION IN CEREBRAL DISEASE. (a)

By Prof. Charcot.

Chapter XII.

II. But before entering in detail into the description of these vessels, it is quite necessary, gentlemen, to examine more closely than we have hitherto done the parts to which they are distributed.

In the last demonstration we have, so to speak, neglected *these* parts, and have indicated in a summary manner the general features of their configuration. That survey is now insufficient; we must enter into minuter details, in order to acquire more exact anatomical knowledge of the parts.

I need not insist on the fact that we are concerned with parts most interesting as regards cerebral localisation—viz., the thalamus opticus, the nucleus caudatus, the nucleus lenticularis, and the internal capsule. These are the different parts which combine to form the *central* system, as opposed to the *cortical* system.

Recall the way in which the crus cerebri, rounded until it reaches the thalamus opticus, is flattened out after it has passed it from within outwards, while it enlarges from before backwards, like a fan. On that fan, to keep up the simile, the nuclei of grey matter are disposed as follows:—within and behind, the *optic thalamus;* still internal, but farther forward and beneath, is the *nucleus caudatus.* Beyond the "fan," and under the optic thalamus, and the *nucleus caudatus,* is the *lenticular nucleus,* which stretches forwards, almost as far as the head of the *corpus striatum,* and backwards very nearly to the posterior end of the *optic thalamus.*

I wish merely to sketch the form and chief relations of the grey nuclei which I have enumerated—

1. The *thalamus opticus* has the form of a flattened ovoid; of its two surfaces, the upper appears in the lateral ventricle, and the inferior (also internal) faces the middle ventricle. On account of its close and numerous connections, it is difficult to separate it by dissection from the contiguous parts.

2. The *nucleus caudatus* is in the form of a cone, or a pyramid, the larger end being directed forwards and inwards, the tail upwards and outwards. The upper surface projects into the ventricle; the internal surface is in great part attached to the upper end of the internal capsule. This nucleus is easily detached by dissection; still, it is necessary, in order to isolate it, to break the numerous fasciculi which it receives from the internal capsule.

3. The *lenticular nucleus,* though its whole circumference is curved over, can be easily isolated from the neighbouring parts, as we shall see. Its general form is ovoid, having its ends anterior and posterior. We find in it two parts—(*a*) the anterior third—the more obtuse—formed of a mass of grey matter, much mixed up in front with the intra-ventricular nucleus of the corpus striatum; (*b*) the second part, consisting of the posterior two-thirds of the lenticular nucleus, is flattened vertically.

The inner and upper surface is intimately connected with the internal capsule; and the lower surface is parallel to the base of the brain. The outer surface is in contact with the external capsule. The "island" indirectly covers its whole surface. It is a very interesting preparation to make, to raise with great care, necessarily, the grey matter of the convolutions of the "island," of the anterior wall, and of the external capsule.

Lastly, one lights on the outer surface of the lenticular nucleus.

With hardened portions of brain one can very easily separate the external capsule from the exterior of the lenticular nucleus. The fact is that there are no medullary bundles—and you will see that there are no vessels either—connecting the external capsule with the third segment of the nucleus.

One may say, from the relations just described, that the three nuclei, or grey central masses—the thalamus,

(a) Translated from *Le Progrès Médical.*

caudate, and lenticular nuclei—are, as Foville has said, appended like cotyledons to the internal capsule, the prolongation of the cerebral peduncles.

On the ventricular side, the thalamus and the caudate nuclei are isolated ; and the lenticular nucleus is isolated in the direction of the insula.

These nuclei of grey matter form a system distinct from the other parts of the brain—by their connections, and by their vascular supply.

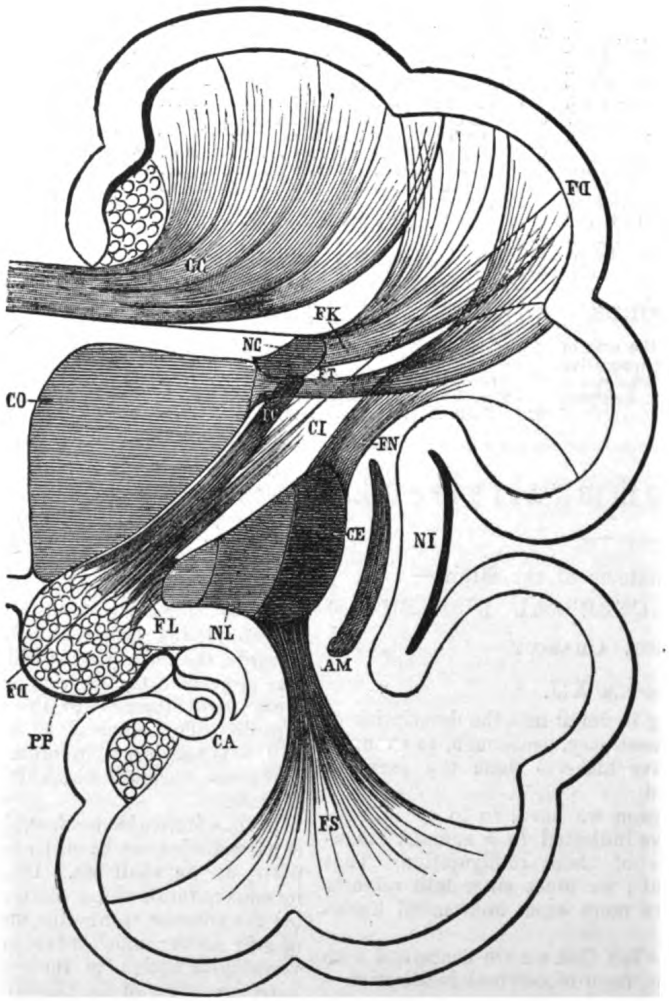
By vertical sections you will easily understand the relations of the central parts. I will not at present insist on the different details of structure of the various nuclei. I will return to them when necessary.

But I must now explain the constitution of the internal capsule.

The internal capsule is, at least a part—a prolongation of a portion of the cerebral peduncle—the *crusta*, or *inferior* layer. The *tegmentum*, or upper layer, which is separated from the crusta by the *locus niger*, is especially connected with the *corpora quadrigemina*, and the *thalamus*, but does not directly contribute to the formation of the internal capsule.

An old theory regarded the internal capsule as completely and directly emanating from the foot of the peduncle.

FIG. 12.



NC, Caudate Nucleus ; CO, Optic Thalamus ; NL, Lenticular Nucleus with its three segments ; AM, Anterior Wall ; CE, External Capsule ; CI, Internal Capsule ; PP, Foot of the Peduncle ; CA, Cornu of Ammon ; IN, Island of Reil ; FL, Fibres of the Peduncle destined for the Lenticular Nucleus ; FC, Fibres of the Peduncle destined for the Caudate Nucleus ; FS, Fibres from the Lenticular Nucleus which are lost in the Sphenoidal Lobe ; FN, Fibres of the Lenticular Nucleus which pass to the periphery ; FR, Fibres of the Caudate Nucleus which pass to the periphery ; FT, Fibres of the Optic Thalamus which pass to the periphery ; FD, Straight Fibres.

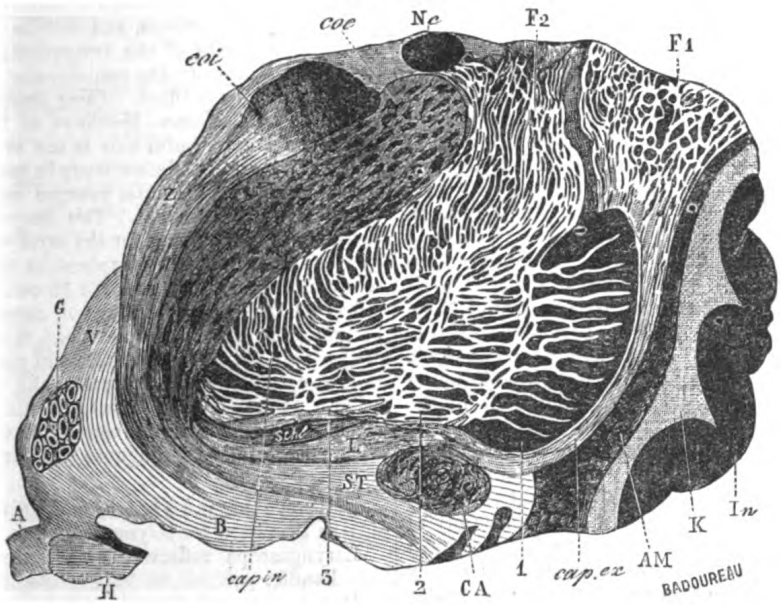
This error has been removed by MM. Luys and Kölliker. These authors have shown that some of the fibres, starting from the "foot," stop on their way to enter the various nuclei. Still, I think they have gone too far in saying that the internal capsule is entirely made up of—(1) fibres of the peduncle, ending in the ganglia ; (2) and of fibres running from the ganglia to the radiating corona.

MM. Meynert, Henle, and Broadbent are of opinion that there is a *third* class of fibres, which are, on the one hand, directly continuous with the "corona," and on the other side with the grey cortex, and the "crusta" of the peduncle.

We shall see that the existence of these last fasciculi rests on a certain number of pathological facts. Among others are certain cases of descending degeneration observed by M. Vulpian and myself.

In the cases to which I allude, we have to do with yellow patches, which had destroyed a large extent of the median convolutions, without any corresponding alteration of the corpus striatum, and had

FIG. 13.



1, 2, 3, Lenticular Nucleus; B, Basilar Portion of the Caudate Nucleus; IV, the Island; K, White Substance between the Island and the Grey Matter; AM, Anterior Wall; Caps. ex, External Capsule; Caps. in, Internal Capsule; CA, Anterior Commissure; H, Optic Nerve and Optic Ganglion; A, Commissure in the Central Cavity of the Mass of Grey Matter; V, Grey Substance of the Third Ventricle; Col and Coe, Internal and External part of the Optic Thalamus; NC, Caudate Nucleus; F, Fibres emanating from the Tapetum; F2, Fibres emanating from the two Internal Segments of the Lenticular Ganglion; ST, L, Schl, and Z, the four layers of the Substantia Innominata.

given place to a descending degeneration, which could be followed through the isthmus, to the lowest parts of the spinal cord.

We are indebted to M. Gudden for a series of confirmatory cases.

Henle probably goes too far when he writes, in his description of the nervous system, that the internal capsule is *especially* composed of fibres prolonging those of the foot. The facts, both pathological and experimental, in favour of the existence of these fibres are numerous and important. We shall be able to demonstrate further on that some of the fibres (the anterior ones) are centrifugal, and are connected with movement of the limbs, while the posterior ones have to do with the transmission of sensory impressions.

According to modern researches, the internal capsule is composed of—

(1) Of direct fasciculi from the peduncles, which traverse the capsule (without stopping) to the ganglia.

(2) Of indirect peduncular fasciculi, some of which run to the corpora striata, approaching them by the lower surface; others go to the lenticular nuclei, penetrating the first segment. Very numerous in the first, they are less and less so in the second and third segments, and it is to this fact that the difference in colour in the three parts of the nucleus is due.

We have nothing to do with peduncular fibres starting from the *foot* of the corona, to the thalamus, as this latter only receives fasciculi from the tegmentum of the cerebral peduncles.

These fasciculi, which pass from the crusta of the peduncle to the grey central nuclei, are succeeded in the upper part of the internal capsule by fasciculi, which, having origin in the grey nuclei, coalesce for the formation of the *corona radiata*, and pass towards the grey cortical substance. These fasciculi are known as "radiating fasciculi."

We must distinguish (1st) the radiating fasciculi of the corpus striatum, (2nd) those of the thalamus opticus, (3rd) those issuing from the lenticular nucleus, which start chiefly from the upper edge of the second and third segments.

It follows from this exposition that four kinds of fasciculi enter into the composition of the corona radiata, and connect the internal capsule with the cortex of the convolutions. These are—

1. The radiating fasciculi of the thalamus.
2. Those of the corpus striatum.
3. Those of the lenticular nucleus.

(These three kinds connect the grey cortex with the central nuclei.)

4. The direct fasciculi which pass from the crusta of the peduncle to the grey cortex without stopping in the grey nuclei.

In the internal capsule itself, and even in the crusta of the corona radiata, one may perceive these arrangements of fibres in their hardened sections slightly magnified—truly the examination is not easy. A little above this point all the fasciculi intermix and cross in all directions, giving rise to an inextricable network called the central white matter.

SOME PRACTICAL REMARKS ON AURAL AFFECTIONS.

By H. MACNAUGHTON JONES, M.D., M.Ch., F.R.C.S.I. and Edin.,

Surgeon to the Cork Ophthalmic and Aural Hospital, with Special Throat Department.

Introductory Remarks.

MANY years have gone by since Sir William Wilde drew attention to the general ignorance which exists amongst medical men on the subject of aural disease. Yet to the present day how few medical men do we find who do not view interference with any aural complication, save the simple blocking-up of the meatus with cerumen, as "meddlesome" and dangerous? How constantly do we hear physicians, well informed on other matters, speak of

any interference with the ear as "poking" and "meddling." The cause of this is not far to seek. To the same source of ignorance is attributable the want of knowledge of ophthalmic and laryngeal affections. The teaching of all the three organs—eye, ear, and throat, is too much neglected in the schools generally. An accurate knowledge of their diseases and pathology is not sufficiently insisted on. Students are satisfied with the most superficial idea of these special branches. Certainly, in this respect the term "speciality" is an unfortunate one. Most students view what they are pleased to regard, and are taught to look on, as special studies, as outside the pale of general surgery. They calculate that at most a question or two in an examination is all they have to fear. They know that most examiners in general surgery are themselves devoid of an accurate special knowledge of these branches. Hence comes neglect in the study of them, and the deplorable result that yearly the great majority of men are obtaining qualifications to practise who are totally ignorant of the advances which have been made in recent years in the diagnosis and treatment of the diseases of three of the most important organs in the body. The remedy is simple and obvious. Students should be practically taught the stress which the examining bodies lay on a sufficient study of these parts. They can only be brought to feel this by a practical examination in all three branches before they obtain their licence. This would speedily cause a greater interest in, and result in a more diffused knowledge of, these subjects. We should not then, as is now frequently the case, have men starting in practice, who have never seen an ophthalmoscope, never looked through an aural speculum, and have never applied a laryngoscopic mirror. To return to the particular organ under discussion, it is my object in these remarks to furnish the student and general practitioner with some brief, but practical, hints on the diagnosis and treatment of aural affections. The many valuable treatises now published on the ear are of course replete with information on this branch of surgery. But from several years' experience, and from constant consultation with medical men I find that such are not carefully or widely read, and hardly at all by students. Hence, through the medium of this journal some concise rules for practice, and useful hints on treatment, may be acceptable both to the practitioner and student. In order to do this I shall endeavour to make these observations as simple as possible, and deal principally with those diseases of every day occurrence, for the treatment of which all practitioners are being constantly consulted. It will not be necessary for this purpose to enter into vexed questions as yet unsettled, but simply to point out the leading principles which should guide the surgeon in arriving at a quick and safe diagnosis in any aural case. Nor is it necessary to distract attention by repeated reference to authorities. The mode of examination which I follow and detail is that usually pursued by aural surgeons; but more especially is that line of practice recommended which was adopted by unquestionably the leading English aurist since Toynbee's death, the late James Hinton. His zeal in the cause of aural surgery, and his anxiety for the spread of knowledge in this department, have attracted many to labour in this field. It was through this same disinterested kindness on the part of Mr. Hinton that I was, many years since, first brought to take an interest in aural surgery, and to feel, in his own words, "that very few fields of practice afford subjects of greater interest to study, or give a larger reward to the exercise of skill."

Those who desire a more extended knowledge of the subject, I would refer to the works and papers of Hinton, especially his "Questions of Aural Surgery," published in 1874, and those of Toynbee, Von Tröltsch, Dalby, St. John Roosas, Turnbull, and others. It is not here necessary to spend time on the anatomy of the organ. Those who are deficient in knowledge on this point had better make good their deficiency before they attempt the treatment of affections of the middle and internal ear. This, however, they can readily do from any standard work on anatomy, in which study they will be materially assisted by models, and the prepared sections of the petrous portion of the temporal bone: 1. The section showing the meatus, membrana tympani, ossicles, and middle ear; 2. The section showing the cavity of the tympanum, and its openings; the internal ear with the semi-circular canals, and cochlea, and the various orifices. These temporal bones may be obtained from Messrs. Matthews, of London, and will be found extremely useful aids in the study of the anatomy of the ear. It must be necessary in many cases to combine the treatment of the nasal passages and throat with that for affections of the ear. This frequently happens, and therefore it is necessary for the aural surgeon to have some special apparatus for the exploration of the nose, the posterior nasal orifices, and the throat. In fact, when we reflect on the large percentage of cases of deafness caused by unhealthy throat complications, it is apparent that one of the main points in the successful management of such is to look carefully to and correct any morbid state of the latter. It may be well here to mention, in order, the apparatus which it is essential should be possessed by all who wish successfully to diagnose and treat affections of the ear.

Bull's eye argand burner, and universal bracket (same as that used for laryngoscope).
Laryngoscope reflector, with spectacle frame, or on handle.
Double otoscope.
Aural specula (three sizes).
Tuning forks.
Pneumatic speculum.
Eustachian catheters (three sizes).
Two of Noyes' catheters (right and left).
Bougies.
Politzer's bags.
Ear syringes.
Small syringe for Eustachian catheter.
Ear forceps.
" Toynbee's lever ring.
" Toynbee's rectangular.
" Hinton's rectangular.
Knife for incising membrane.
Iris hook.
Turnbull's Eustachian forceps.
Wilde's snare for polypus.
Turnbull's rheophore.
Artificial membranes.
Absorbent cotton wool.
Tongue depressor.
Nasal specula.
Nasal douches (syphon and bag).
Laryngeal mirrors.
Mirror for rhinoscopy.
Laryngeal brushes.
Tonsil guillotine.

Though this to some may appear a formidable list, it must be remembered that it includes nearly every instrument requisite for the treatment of any aural affection, certainly most that would be required in ordinary practice.

With a speculum, tuning fork, otoscope, Eustachian catheter, and Politzer's bag, the great majority of aural lesions may be diagnosed with comparative certainty. The remaining instruments are not so much diagnostic as therapeutical, and for the purpose of treatment. We shall consider the method of employment of, and the most improved form of each of these instruments as we are dealing with the various states necessitating their use. We now pass to the best plan of examination, and the steps in consecutive order, which it is necessary to take in proceeding to form a diagnosis. The following method of examination is the one I usually adopt:—

1. History of case.
2. Present symptoms.
3. Hereditary influences.
4. Hearing distance (HD).
5. External meatus (EM).
6. Membrana tympani (MT).

7. Tuning fork (TF).
8. Eustachian tube (E T).
9. Throat.
10. Past treatment.

This can be done in tabular form thus :—

No. of Case—Name—Age.
History, &c.
Symptoms.

	Right ear.	Left.
HD	"	"
EM	"	"
MT	"	"
TF	"	"
ET	"	"
Throat.		

We will now take a given case of deafness and investigate the mode of ascertaining the condition of the various parts of the organ of hearing above tabulated.

(To be continued.)

NOTES ON DIPHTHERIA. (a)

By H. Kennedy, M.B.

As the author did not intend to do more than speak of his own experience of the disease, he, in the first instance, drew attention to the fact that diphtheria prevailed in England for some months previous to its appearance here, just as had occurred with the cholera in 1832, and with the great fever epidemic of 1847-48, the origin of which the public originally attributed to the famine in this country, whereas the truth was that fever had existed in England far above the averages for months previous to its appearance in Ireland. The author then detailed the first case of diphtheria which came under his notice. It occurred in a woman of 40, labouring at the time under a very severe attack of typhus fever. The great feature which struck him in this case was the marked change which took place in the fever when the diphtheria appeared, and more particularly in the pulse, which became full and bounding. After a severe struggle this case recovered. He then drew attention to the fact that cases had come under his notice where no exudation showed itself, and yet the sore-throat was diphtheria, for other children of the same family, and at the same time, had the exudation. This he thought important, for it was clear that in these cases the diagnosis might very readily be erroneous, and that this did sometimes occur he knew as a matter of experience. In a case he had seen with Dr. Wyse, where dysphagia and inability to put out the tongue were the only striking symptoms present, the diagnosis was very obscure, nor could any history of a previous attack of diphtheria be made out. Yet these symptoms were most probably due to this disease, for almost at the same time a second child in the family exhibited diphtheria in a well marked form. The author then drew attention to the complications which might occur with diphtheria. He had often met it in both typhus and typhoid fevers. Murchison had noticed it in the latter, but it occurred in both, nor did he (the author) consider it a very fatal complication. Diphtheria seemed also to have some very close connection with scarlatina, though it was by no means unusual to see only some of the members of the same family exhibiting the specific exudation at a time when all were ill of scarlatina.

But the chief point the author wished to notice was the question of the identity or non-identity of diphtheria and croup, on which a great discussion had lately taken place in London, and the conclusion being that they were the same disease. In this view the author could not at all agree. He considered one essentially a constitutional disease, and attended very constantly by marked asthenic symptoms, whilst he looked on the other as a simple inflammation of the larynx and trachea, and occasionally the bronchial tubes. He had not seen diphtheria begin in the larynx, nor in any case which he regarded as croup had he seen the inner throat engaged, or the glands of the neck. He further drew attention to the different ways in which death occurred in the two affections, and to the marked contrast of the treatment suitable to each, as well as to the fact that out of nearly twenty specimens of croup in the museum of the College of Surgeons two only were spoken of as being diphtheric, the inner throat being healthy in the others. He stated further, too, that in Cheyne's description of croup it was expressly noticed that the internal fauces were healthy. For all these reasons he could arrive at no other conclusion but that the two affections were essentially different. Speaking of the treatment of diphtheria, the author observed the little advantage which was derived from the use of poultices, as contrasted with other affections of the throat. He had also found that in many cases the throat was unusually slow in getting well, and in these he had used the Fowlers solution with very striking benefit.

(a) Abstract of a paper read before the Dublin Obstetrical Society, Dec. 9, 1876. The discussion will be found at page 67.

NOTES OF, AND REMARKS ON, CASES OF CARDIAC DISEASE.

By James Barr, M.B., L.R.C.S.Ed.,
Late House Surgeon, Northern Hospital, Liverpool.

I.—*Case of Peri- and Endo-Carditis—Dilated Hypertrophy of both Ventricles—Death—Autopsy.*

In your issue of November 15th I published two undoubted cases of *idiopathic* pericarditis, and in some respects the following one might seem worthy of a similar appelation, but the history of injury in the case, and the fact of the pericarditis being associated with endocarditis make me hesitate to rank it in the same category.

J. P., æt. 9, admitted under the care of Dr. Dickinson, October 7th, 1875, with very urgent cardiac dyspnœa. His lips and face are pale ; countenance very anxious and distressed ; he requires to be propped up in bed, lies on his left side, and appears to suffer intensely from severe orthopnœa. Respirations 60 ; pulse 120, small and easily compressed.

There is bulging of the cardiac region, and the percussion dulness is very much increased, extending from the right of sternum to 2½ inches beyond the left nipple line, and measuring transversely 7½ inches. A diffuse heaving impulse is felt over the greater part of the dull area. The heart's rhythm is regular ; the sounds are obscure ; and at several points over the cardiac area there is heard a fine double creaking friction murmur, and also along the left cardiac limit there is much louder and coarser friction corresponding with the respiratory rhythm. At the apex there is a soft blowing ventricular systolic murmur (mitral regurgitant).

His mother states that about two months ago he fell from a high wall and injured his left side, and to that she ascribes his present complaint, which she says dates from that time. She says he never had rheumatism.

Oct. 8th.—Face livid ; there is great distress, and orthopnœa is very urgent. Respirations 72 ; pulse 120, very small and weak. The physical signs are as before noted, but in addition there is very loud snoring-rhonchus heard all over both lungs, which obscures the cardiac murmurs.

Paracentesis pericardii being determined on, it was performed in the fourth left interspace with a fine needle of Dieulafoy's aspirator, but nothing came away, except a few drops of blood.

Died this evening. At the autopsy, seventeen hours after death, the pericardial surfaces were found adherent over the whole anterior and greater part of the posterior surface by a soft gelatinous material. The pericardium contained about four ounces of fluid, which was chiefly located in two pouches, one along the right cardiac margin behind the sternum, and the other behind the left ven-

tricle. The walls of both ventricles—especially the left—were hypertrophied and their cavities dilated. The right ventricle was filled with dark clotted blood, and extending into the pulmonary artery there was a large semi-decolorized clot. The left cavities were almost empty. The border of the mitral valve was covered on its ventricular surface with fine fibrinous vegetations. At the commencemencement of the aorta there were several small atheromatous patches. The heart weighed 16 ounces. Lungs very œdematous. Liver, spleen, and kidneys normal.

Remarks.—The etiology of this case is obscure, and notwithstanding the definite history of a fall on the left side yet it is very doubtful if such was the cause of the complaint, for in that instance we would have expected some local evidence of the injury sustained, but there was none present. The fact of there being also endocarditis would lead us to seek for the *origo mali* in some diathetic condition of the system, but there was no history of any general disease. However, as every effect must have its cause, and in this case the cause was most probably not a local one we are led to the conclusion that the pericarditis and endocarditis were local expressions of a general disease, most probably a low form of subacute rheumatism, whose local manifestations were limited to the serous membranes of the heart, or, if more general, were, in other respects, unobserved. Dr. Stokes saw a case of pericarditis precede rheumatic arthritis by ten days, and Dr. Graves saw one where it preceded the joint affection by five days, the pericardial symptoms subsiding before joint affection began.

Not only was this case interesting from an etiological point of view, but also from the nature of the lymph effused into the pericardium, which was of a jelly-like appearance, and quite different in its physical qualities from the more firm honey-combed lymph ordinarily found in recent cases of pericarditis. Dr. Blakiston says, the former variety of lymph—to which he has given the name "gelatiniforni"—"is usually found in the milder forms of inflammation. It is highly organisable, and for this reason being rapidly filled with blood-vessels, it soon forms a connection, partial or general, between the visceral and parietal layers of the pericardium. The similarity between this effusion and that observed by Bizot as the forerunner of horny deposit on the lining membrane of the arteries is striking.'

The cause of failure of the paracentesis was very evident at the autopsy, but the condition which was then revealed could not be foreseen during life.

II.—*Case of Sub-Acute Rheumatism—Mitral Incompetency and Choreic Movements of the Right Upper Extremity.*

D. M., admitted under the care of Dr. Dickinson, November 10th, 1874, with swelling of the knee-joints of three weeks' standing, evidently due to a low sub-acute attack of rheumatism. He has also a mitral regurgitant murmur and choreic twitchings of the right hand and arm. These movements have not been noticed by the patient or his relatives until their attention is now drawn to them.

He has never been a stout boy, and when only ten weeks old had abscesses in the neck. At the age of two years he suffered from scarlet-fever.

His mother is an anæmic-looking woman, who says she had rheumatism when a child, but never chorea. She is not aware of any of their relations having ever suffered from this or heart disease. She says her husband is healthy. This boy is the eldest of six children, two of whom died of "decline," and the others are rather delicate.

His knee-joints are much swollen, painful and tender on pressure. Temperature moderately febrile. Tongue slightly furred; appetite fair. He has a scrofulous appearance, but there is no glandular swelling. The upper incisor teeth are distinctly notched. The choreic movements are limited to the right hand and forearm, and are most marked in the thumb, fore, and middle fingers.

The heart's apex is situated in the fourth interspace within the nipple line. Transverse dulness, 2¾ inches. There is a loud mitral systolic murmur, and the second sound is accentuated at the pulmonic cartilage. Pulse 100, weak. Urine normal.

He was ordered cod-liver oil, with syrup of the iodide of iron; a liberal diet; and had iodine ointment rubbed on his knee-joints.

Dec. 4th.—He is better of the rheumatic symptoms, but there is some swelling of the thyroid gland to-day, for which he is to have that painted with tincture of iodine.

Jan. 20th.—He is now pretty well, but the choreic twitchings and mitral murmur still remain. He was sent to-day to the Convalescent Institution for three weeks.

Remarks.—This case is very interesting as presenting three diseases at the same time, which have been long known to have some peculiar relation to one another. Opinions have differed as to the nature of the association and as to the order of the sequence, some hold that the chorea succeeds the heart affection, while others ascribe the mitral regurgitation to choreic or irregular contraction of the papillary muscles. This latter hypothesis is too absurd to require any comment.

If, with Dr. Hughlings Jackson, we believe chorea to be due to embolic lesions, then we have a ready interpretation of the phenomena in this case; but my purpose here is not to enter into a discussion on the subject, but merely to state the facts as I observed them.

A CASE OF POST-PARTUM SMALL-POX.

By W. T. Greene, M.A., M.D., &c.

On the 23rd of December, 1876, I was sent for to see Mrs. B—, pregnant with her first child, and who expected to be confined about the end of the month. The nurse stated that the patient had been in labour all night, but on making an examination I found the os uteri quite closed, and that the woman had barely completed eight months of her time. I prescribed an anodyne mixture, and thought I should hear no more of the case for some weeks. The pains, however, continued more or less, chiefly in the back, until the evening of the 26th of December, when they assumed the character of true labour pains, and the patinnt was delivered on the following morning, about nine o'clock. In the evening she was very feverish, passed a bad night, and next morning I found her covered thickly with a papular eruption, unmistakeably variolous. The room was very warm, and the patient delirious. I at once had the fire put out, and ordered half the blankets to be removed from the bed; the delirium vanished as if by magic, and the patient made an excellent recovery. The eruption began to fade on the fourth day, and had quite disappeared by the end of a fortnight.

I vaccinated the infant on the second day (not having been able to obtain any lymph before), but small-pox appeared with the vaccination vesicles; the two diseases ran their course, *pari passu*, and the child died exhausted on the tenth day from its birth.

Clinical Records.

ST. MARY'S HOSPITAL.

Under the care of Dr. Handfield Jones.

Suppurating Arachnitis resulting from long-standing Disease of the Ear—Death.

Reported by Swain Scriven, L.S.A.

No. 933.—M. A. C., æt. 19, was admitted into St. Mary's Hospital on the evening of Dec. 4, 1876. Female, single, domestic servant. Had had a discharge from the left ear since childhood. A fortnight before admission she became suddenly faint, and would have fallen, but a fellow-servant caught her; she fainted, and also had rigors several times subsequent to this and prior to admission. Suffered a good deal from head-ache, and talking

or looking at a candle gave her great pain; she also complained of throbbing in the head and double vision, and said that formerly she had strabismus.

On admission, has severe head-ache, feels sick, and has pain over the second cervical vertebra, great pain below left ear and pain above left pinna. Chest normal on percussion and auscultation. Bowels confined. Temp. 101·4. Sees double, complains of general pains, but no want of co-ordination of muscles, and moves limbs with ease. The left ear was syringed out with tepid water, containing one grain of carbolic acid to the ounce. A blister applied over painful part of neck and hydrag. sub-chlori. one grain, and pulv. opii, one-sixth of a grain ordered every two hours.

During the night patient was wandering and slightly delirious, complaining of great pain in the head. The wandering ceased a little before eight o'clock on the morning of the 5th December, and she talked rationally; her tongue was now brown, and coated with thick fur. At half-past eight a.m., the sister in charge of the ward gave her some milk, which she drank. She then spoke rationally to the sister, who on turning away to put down the cup, had scarcely reached the table, when she was recalled by the nurse to find the patient dying.

A *post-mortem* examination was held 28 hours after death, when the following points were made out. Head.—Scalp and calvarium normal; the left lateral sinus, at the point nearest the mastoid cells, where it is curving round, was distended by ante-mortem clot. No clot in internal jugular vein. On removing the dura mater the bone corresponding to the clot was found discoloured and somewhat softened. On opening the ear pus and cheesy material were found in the middle ear, and extending backwards into the mastoid cells, where the bone was much softened. The brain weighed 2lb. 11oz. Pus was seen oozing over the surface of the brain; on raising it out of its bed, the pus was found to come from the under surface of the tentorium cerebelli. There was a layer of lymph, with extreme congestion on the surface of the brain immediately below it, *i.e.*, on the upper surface of the lobes of the cerebellum, the part in direct contact with the inflamed tentorium. The inflammation was localised, not spreading over the base, where the membranes were normal. The brain tissue was normal throughout, except a little softening about the velum interpositum and septum lucidum; inflammation having apparently extended along the membranes from the adjacent spot of disease, and turned into the ventricles.

Enlarged glands were found on each side of the trachea and outside the sheath of carotid arteries and jugular veins, the chain extending down into the thorax, and at lower end of the trachea several cretaceous and cheesy glands were found.

The thoracic and abdominal viscera were normal except as follows:—The left side of the heart was very firmly contracted. A calcareous gland was found in the mesentery. The capsule of the liver was thickened and dulled. The liver was much increased in size, weighed 4lb. 2oz., was congested and rather mottled, soft, apparently fatty, but did not burn with a flame. Spleen was much enlarged, weight 15 oz., and excessively soft, breaking down with its own weight. Kidneys extremely congested, weight 14½ oz. Supra-renal capsules: in one was a cheesy nodule, size of a marble, destroying the cortical and medullary part. At left lower lung there were some few old and slight adhesions of pleura.

In this case there was no violence to account for the arachnitis. The disease of the ear was an old standing one, dating from childhood. Yet the patient, though suffering from head-ache, &c., as shown above, was able to continue to discharge her duties as a housemaid till within a fortnight before her death. It was evident that the brain mischief was only of recent date, and it may also be noteworthy that she wandered in her mind at times only on the night preceding her death, whilst a few seconds before she died she was talking rationally to the sister.

Students' Column.

LECTURES ON HUMAN ANATOMY—DESCRIPTIVE AND SURGICAL.

By Walter Rivington, M.S. Lond., F.R.C.S. Eng.,
Surgeon to the London Hospital, and Lecturer on Anatomy at the London Hospital Medical College.

Lecture XI.—(*Concluded from* Medical Press and Circular, *Dec.* 16, 1874.)

Specimens of Curvatures of the Spine; Fractures of the Ribs and Sternum.—There are several specimens in the Museum which illustrate the alterations which occur in the thorax as the result of curvatures of the spine. Here is a specimen marked Fb. 25. It is an angular curvature, taken from the body of a female. The portion of the spinal column above and below the seat of disease form an acute angle with each other, and the apex of the angle is at the spinous process of the 10th dorsal vertebra. There appears to have been a destruction of the bodies of the dorsal vertebræ from the 7th to the 11th or 12th, and the remains of these vertebræ have united to each other. It is a little difficult to determine precisely the limits of destruction in a dried specimen like this, but it is evident that the ravages of disease have been considerable. The alteration in the shape of the thorax is very striking. It looks as if the ribs had been forcibly compressed laterally between the hands, so as to straighten them, and to cause a considerable decrease of the transverse diameter of the chest and a corresponding increase of the antero posterior. The sternum, including the ensiform cartilage, measures rather more than 6½ inches, and is much arched forwards, the highest point of the arch being about 1⅞ inches. In consequence of the projection forwards of the cervical vertebræ, the upper opening of the thorax is very much contracted, measuring less than an inch in the centre from the top of the sternum to the 4th cervical vertebra. The 1st, 2nd, and 3rd ribs curve upwards, so that their anterior ends are considerably higher than their posterior. All the ribs are very close together, and on the left side the 2nd, 3rd, 4th, and 5th ride over each other from want of room in front of their angles. The costal cartilages are but little affected. The chief change consists in a flattening of the upper ribs, from a point near the angles to the cartilages, and of the lower ribs from the tubercles to the cartilages. The 11th ribs run down and rest on the crests of the ilia. The antero posterior diameter of the chest from the hollow formed by the destruction of the bodies of the vertebræ to the sternum, between the 4th costal cartilages, measures nearly 7 inches—the transverse diameter measures 6 inches. The longest antero posterior diameter is from the hollow at the side of the bodies of the vertebræ to the cartilages of the ribs, and in the centre of the chest reaches 8 inches.

I take next the specimen marked Fb. 44. It is a posterior curvature of the spine, apparently from a male subject, the result of the disease known as mollities ossium, or softening of the bones. Unfortunately, there is no further history or description, for it is an interesting and venerable specimen, used for many years by the distinguished men who taught surgery in the London Hospital School for the illustration of their lectures. In this specimen the dorsal vertebræ form a rounded curve backwards. Just such a curve as might result from an exaggeration of the natural curve in this region. Accompanying the posterior curve is a lateral curvature of the bodies of some of the middle dorsal vertebræ to the right, the spinous processes and the right transverse processes being turned towards the left side. There is no caries or breach of surface: the vertebræ are simply compressed in front and at the sides. The ribs are much distorted: the prevailing alteration in shape is similar to that seen in the last specimen. It is a lateral flattening, but in combination with irregular indentations. The transverse diameter of the chest is reduced much more than in the last case. It measures about 4 inches only, whereas the antero posterior diameter is 8 or 9 inches. The sternum is much arched and distorted. The manubrium is bent backwards at the lower part, the gladiolus and ensiform cartilage project, and the cartilages of the ribs are pressed backwards and inwards. The upper opening of the chest measures an inch and three-quarters, and the lower opening is much altered in shape by the cartilages of the false ribs being drawn inwards towards each other.

Some of the ribs have the appearance in places of union after fracture. The costal cartilages of the 9th and 10th right ribs, and the 10th left rib, are free and curled at their

extremities. On the whole it seems as if the distortion of the ribs in this case had arisen chiefly from the action of the diaphragm on bones deficient in earthy matter. The pelvis is also distorted. Several specimens illustrate lateral curvature both in slight and in extreme degrees.

Fb. 45 is a slight case. The ribs are cut off short, but it is easy to see that the bodies of the vertebræ are rotated towards the convexities of the curves, that this involves a deflection of the spines to the opposite side and that in the dorsal region the transverse processes and ribs on the right side where the convexity of the dorsal curve appears, are thrown back and project beyond the corresponding parts on the left side. In Fb. 47, which is a more severe example, the bodies of the dorsal vertebræ are rotated so much to the right side, that some of the ribs are in contact with them; on the left side the ribs are very close together. This rotation of the vertebræ and projection of the ribs further back on one side than on the other, causes generally a corresponding obliquity of the sternum. The costal cartilages and edge of the sternum on the side of the convexity of the dorsal curve are further back than on the other where the similar parts form an unnatural projection.

Fb. 46 is a very interesting specimen. It is a link between a lateral and angular curvature. As in the lateral curvature, there is no caries of the bodies of the vertebræ, but there is rotation of the vertebræ to an extreme degree. As in the angular curvature, there is a sharp bending backwards of the spine in the dorsal region. The apex of the curve is at the 8th dorsal vertebra. Compression and absorption of the sides of the bodies of the 7th, 8th, and 9th vertebræ are apparent. Unlike the ordinary lateral curvature, there is no corresponding curve in the lumbar region; and unlike the angular curvature there is rotation and bending to the left side. During life this deformity would probably have been mistaken for a true angular curvature resulting from caries of the bodies of the vertebræ.

Fractures of the ribs may result either from direct or indirect violence. Fractures from direct violence occur at the seat of injury; fractures from indirect violence, as for instance, when the patient has been squeezed between two bodies, will commonly be found at or near the angles. The ribs most liable to fracture are the fourth, fifth, sixth, and seventh. The first rib is so well protected by its natural strength, its depth below the surface, and by the superjacent structures, especially the clavicle, that it is rarely broken except in severe injuries, such as the passage of a cart over the chest, or the fall of a heavy weight on to the back. Gbd. 4 is a fracture of the first rib, caused by the wheel of a vehicle. There is an irregular fracture about the middle of the bone, and it was associated with fractures of several of the other ribs. Fractures of the ribs are only dangerous accidents when they result from great violence, and are associated with wounds of the pleura and lungs, caused by the broken ends of the bones. The patient from whom the specimen Gbd. 5 in our museum was taken, died of acute pleurisy, the consequence of laceration of the pleura by the sharp ends of the last rib. In this case the 10th, 11th, and 12th ribs were broken by direct violence 3 inches from the spine. One or two similar cases have occurred under my notice at the hospital. It is not uncommon to find bridges or buttresses of bone stretching across between ribs which have undergone fracture. Such is the specimen in the museum marked Gbd. 2, and showing portions of 2 ribs which had been fractured transversely, about 2 inches from the sternum, and are well united by bone. The 2 ribs are three-quarters of an inch apart, but at the site of fracture a strong bridge of bone a quarter of an inch thick, passes obliquely from one to the other, and joins them both most firmly together.

The costal cartilages may be broken by the same violence which fractures the ribs. Union sometimes occurs by means of bands of fibrous tissue, and false joints may be formed. Gbd. 3 is an excellent instance of the repair of fractured cartilage. It is a transverse fracture of one of the costal cartilages on the left side, about half an inch from the end of the rib. "The costal extremity has been displaced in front of the sternal one, which it overlaps for a third of an inch. The displaced portions are firmly bound together by fibrous bands, and a sort of false joint is left, which, however, permits of but little motion. No bone has been deposited, and there has been no absorption of cartilage." Sometimes these fractures remain ununited, and the two ends of the cartilages continue freely movable. For an example you may refer to Gbd. 7, a specimen presented by Mr. Hutchinson, and showing an ununited fracture of the fifth costal cartilage which had taken place ten years previously to the patient's death. In this case also the costal end of the cartilage is displaced forward. This is interesting because Hamilton states that the anterior or sternal end is generally found in front of the posterior or "spinal," a remark not improbably made on insufficient data. The proper method of union is by bone and not by cartilage or fibrous tissue; but failure of bony union is certainly not uncommon. Hamilton gives one case which he had seen at the end of a year. "The fracture had occurred in the united cartilages of the tenth and eleventh ribs," and in this case also "the posterior fragment overlapped the anterior, and they played freely over each other at each act of inspiration and expiration."

The costal cartilages may be divided by cutting instruments, and so may the ribs themselves. Gbd. 6, presented by Mr. Curling, is an excellent example. The seventh rib has been cleanly divided. The injury was a suicidal stab made with a shoemaker's knife, and the wound in the skin was only an inch in length. The diaphragm was wounded at the same time.

Fractures of the Sternum are not of very common occurrence, but they are met with either separately or in conjunction with fractures and dislocations of the spine. Under the head of fractures some would include the separation of the manubrium from the gladiolus, which is a frequent form which injury to the sternum assumes. The ordinary condition of parts found in displacements of the first two segments of the sternum is riding of the upper end of the gladiolus over the lower end of the manubrium. For examples of this accident you may refer to the specimens marked Gbe. 5, and Gbd. 8. Gbe. 5, was taken from a man who fell into a pit from a great height and fractured his spine. The manubrium is displaced backwards, and overlapped by the gladiolus as much as half an inch, and the ligamentous structures both in front and behind remain entire. In other cases the anterior ligament is torn, whilst the posterior remains entire. The 2nd pair of ribs is generally found attached to the manubrium, and the posterior ligament is stripped up from the sternum as low as the level of the third pair of ribs. These peculiarities result from the anatomical disposition of the parts. You may remember that the salient angle or spur of the cartilage of the first rib is united to the cartilage covering the lower end of the manubrium, and that the union of the 2nd rib with the manubrium is stronger than it is with the gladiolus. Hence the 2nd rib accompanies the manubrium in displacements. The periosteum is not stripped up below the level of the 3rd ribs, because its fibres are more intimately connected with the bone at that spot than they are above it. In those cases in which a diarthrodal joint has existed between the manubrium and the gladiolus, you will find the ends of these segments each covered by a distinct layer of cartilage.

The sternum may be broken in any part. The weakest part of the bone is in the immediate neighbourhood of the third costal cartilages, and fracture is most common in this situation. For examples of fracture you may refer to Gbe. 2 and Gbe. 3.

Fractures and displacement of the sternum may be caused either by direct or indirect violence. Examples of direct violence are—gunshot wounds, falls of heavy bodies and severe blows on the bone, the passage of a cart over the chest, and (as some suppose) the forcible descent of the chin on to the manubrium from blows or falls on the head. Instances of fractured sternum, in connection with fractured spine, will be found in specimens Gbe. 2, 3, 4, and 5.

Examples of indirect violence are—falls on the feet and nates, falls and blows on the back. It is not easy to understand how a mere fall on the feet or nates could fracture the sternum, when we consider the slight flexibility of the dorsal region of the spine and the firmness with which the ribs are fastened to the bodies and transverse processes of the vertebræ. Nor is it necessary to accept such a cause, for in some of the recorded cases, at any rate, the patients rolled on to their backs after alighting on the feet or nates. A rigid analysis would probably succeed in reducing most, if not all, cases of indirect violence into force applied directly to the dorsal vertebræ. David, Sabatier, and Roland have each described a case of a fall on to the back resulting in fracture of the sternum. David's case was that of a mason who fell from a height on to a crossbar; and the explanation given of the fracture (which was situated between the upper and middle portions of the sternum) is the stretching to which the sternum was subjected between the sterno-mastoid

muscles above and the abdominal muscles below. I am inclined to think that this explanation is not entirely sufficient. A man was admitted, under my care, in the hospital with a separation of the manubrium from the gladiolus. A heavy bag of seed had fallen from a height, and struck the patient's back between the scapulæ. At the post-mortem we found the six upper ribs on the left side broken beyond the transverse processes, the spinous processes of several of the upper dorsal vertebræ detached, and the bodies of the vertebræ fractured. In this case, it is evident that the force of the blow was conveyed through the ribs to the sternum. The manubrium being comparatively immovable, and the upper ribs shorter and less efficient as levers than the lower, the gladiolus would be driven more forcibly and further forward than the manubrium, and thus the displacement would be caused. The fixation of the two ends of the sternum by the muscles attached to them would act as auxiliary forces. This I believe to be a more correct explanation of the occurrence of displacenent or fracture than mere stretching between the muscles. I do not, however, absolutely deny that the sternum *may* be fractured by muscular action in other instances. Cases are related of fracture from the expulsive exertions of women in labour, and from sudden action of the muscles in the opposite sex. In these cases, however, the muscles were manifestly in violent action, whereas in falls from a height it is by no means certain that they do more than oppose a passive resistance, insufficient, probably, to cause the injury.

The ensiform cartilage may be broken or driven inwardly by a direct blow. Hamilton relates a remarkable instance. A man, twenty-eight years of age, fell forwards and struck the lower end of his sternum upon the top of a candlestick. The xiphoid cartilage was driven backwards, and remained permanently displaced and pointing towards the spine. For two years after the accident the patient suffered from violent and distressing attacks of vomiting, which occurred every five or six days. Excision of the cartilage was recommended by his medical advisers, but declined by the patient. Ultimately he recovered perfectly (*a*).

Mr. Hilton has drawn special attention to the immunity of the costo-vertebral articulations from injury and disease. Isolated disease or isolated ankylosis of these joints is of exceedingly rare occurrence. A case of complete anchylosis and immobility of the ribs, due to a blow on the lower part of the cervical region of the spine, in what manner is not at all clear, was met with by Mr. Hilton. The subject of it lived twelve years after the ribs became fixed, and was actively engaged in business. The work of respiration was carried on solely by the diaphragm and abdominal muscles. Mr. Hilton attributes the immunity of the costo-vertebral joints from disease to their immunity from injury, and to their enjoying rest during sleep. The immunity strikes us the more when we reflect on the number of times that these articular surfaces are rubbed upon each other during respiration. I have, says Mr. Hilton, in his beautiful volume on "Rest and Pain," taken the case of a child five years old, and the number of respirations at thirty in a minute (about twenty-six is said to be the number); this would give 1,800 in an hour, 43,200 in a day, and the enormous amount of 15,768,000 respirations in a year. Every respiration consists of two movements—inspiration (ascending), and expiration (descending), so that the friction must be double. Consequently, at five years of age the number of movements is about 31,536,000 in the year, and yet these joints are never diseased.

Rare also is disease between the manubrium and gladiolus. When it occurs it may generally be traced to previous injury. An instructive case is related by Mr. Hilton in the work just quoted. Ankylosis at an early age in this joint is not nearly so uncommon as has been supposed. I have met with several examples.

I cannot conclude this lecture without briefly referring to the advantage which the surgeon takes of the elasticity of the ribs and costal cartilages to preserve the lives of those threatened with death from apnœa. Artificial respiration, as it is termed, is carried out in one of three ways, the manual method, the method of Marshall Hall, and the method of Silvester. The manual method is based on the familiar fact that air may be expelled from the thorax by pressure on the chest. When the pressure ceases air rushes into the lungs in consequence of the elastic recoil of the osseo-cartilaginous hoops which form the wall of the chest. The pressure should be applied rythmically to the lower part of the chest wall, and to the abdomen. Dr. Marshall Hall imitated the movements of respiration by alternately moving the body into the prone and lateral positions; motion from the lateral to the prone position representing expiration, and motion in the other direction inspiration. Silvester imitated inspiration by extending the arms upwards by the side of the head, the muscles passing from the arm to the chest elevating the ribs; and expiration by bringing the arms down again to the side of the chest. Silvester's plan is considered superior to Marshall Hall's, and has received some unimportant modifications at the hands of Professor Pasini and Dr. Bain. The application of either of these methods to rescue our fellow-creatures from death by drowning or suffocation from other causes is practical anatomy and physiology in the highest sense of the words.

Transactions of Societies.

PATHOLOGICAL SOCIETY OF LONDON.

President's Address.

Dr. Murchison, the newly elected President, said. The remarks which I have to make in taking the chair for the first time will be so brief as not, I hope, materially to interfere with the success of the experiment to be made to-night of a new mode of conducting our business. My first duty is to return my thanks for the great honour which I feel you have conferred upon me by electing me President of the Pathological Society. I am deeply sensible of the responsibility which is involved in the endeavour to tread in the steps of the distinguished men who have preceded me, and to discharge satisfactorily the duties of this office at the present stage of the Society's history. This feeling of responsibility is enhanced by knowing the ability and urbanity with which my immediate predecessor has presided over you, and by the conviction that many others might have filled this chair with greater distinction and advantage to the Society than myself. More than thirty years have elapsed since the first meeting of this Society was held on October 13th, 1846, at 21 Regent Street, under the presidency of one of the foremost pathologists of the day, Dr. C. J. B. Williams. Since its foundation, its career has been one of continued prosperity. You have only to read the account of the first meeting to see that the founders of this Society who survive are now leaders of the profession; and, from the first, it may be said that this Society has been the nursery of our rising physicians and surgeons. It is here that they have imbibed that love for pathology which must be the foundation of successful diagnosis in practice, and to the prosecution of which we mainly look for progress in our art. It is not only true that an experienced pathologist can rarely attend the meetings of the Society without learning something new to him; but the very existence of the Society has indirectly contributed to stimulate, outside its precincts, a line of investigation which, before its foundation, was disregarded to an extent that few of our younger members would readily believe. The fashion of treating symptoms, rather than in the first place of endeavouring to discover their cause, has been exploded in a great measure by the labours of the Pathological Society, which has thus been the means of effecting a great revolution in therapeutics. *Nec silet mors* was the expressive motto adopted by our founders, and for thirty years the dead body has been invoked to reveal every fact bearing upon the pathological process which has terminated life. It has been a characteristic feature of this Society that its labours have been restricted to the rigid investigation and record of facts, and that no communication has been received unaccompanied by drawings, microscopic preparations, casts or models of the morbid appearance, or by the actual specimens themselves; while the statements of exhibitors have constantly been subjected to confirmation or correction by duly qualified committees. The result of our labours has been twenty-seven volumes of *Transactions*, which embody the most important facts observed in the dead-houses of our metropolitan schools, and which have obtained a world-wide reputation. Our present danger is that of an embarrassment of riches, and a multiplication of specimens differing little, if at all, from those already exhibited and recorded. The result is that, in order to get through the list in the short time allotted to our meetings, the discussion

on really interesting and important specimens is often choked; and there is thus a want of life in our meetings. To obviate this inconvenience, the Society has more than once been advised to make a selection from the specimens offered for exhibition. This, however, would not only be a very invidious duty for the Council or the Secretaries to undertake, but, after some experience of the practical working of the Society, I have no hesitation in saying that I believe such a plan would be fatal to its popularity and its best interests. The remedy rests with the members rather than with the office-bearers. Our junior members more especially ought to bear in mind that specimens which are interesting to them may not be calculated to advance pathological science at its present stage, and if so, are not fitted for exhibition to this Society, or for being recorded in its *Transactions*. On the other hand, a specimen which is a very ordinary one from a purely anatomical point of view, may acquire great importance from the history, or from observations made during the life of the patient, or may be of great interest in reference to prognosis. The clinical features of the cases, so far as they bear upon the specimens exhibited, come strictly within the province of this Society, but are sometimes lost sight of. It has also often struck me as remarkable, how deficient medical literature still is in a careful record of well authenticated cases, illustrating the possible duration of various anatomical lesions, and how far they are compatible with life and a fair amount of health; and, yet, a large number of cases of this sort are necessary for the foundation of the still neglected department of prognosis. This is a want which the Pathological Society might well supply, by a record of specimens exhibited in this room where the history has left no doubt as to the duration of the lesion before death. It is to those of our members engaged in family practice that we mainly look for assistance in this matter. But what I especially wish to call attention to, is the desirability of each member, before he brings forward the specimen, asking himself whether it is calculated to advance our knowledge of pathology. In the event of his being satisfied on this point, he ought in the next place to keep in view the main object that he has in bringing it forward—what, in fact, it illustrates—what previous statement it confirms or refutes, and that object he ought to state to the meeting clearly and prominently, and yet concisely; avoiding, as far as possible, newly-coined German words, and using language which will be intelligible to his seniors. Long anatomical and microscopical descriptions are better reserved for publication in the *Transactions*. In endeavouring to follow them at the meeting, the audience often loses the point of the case, and consequently there is no discussion. If each exhibitor would prepare himself beforehand to give the pith of his case, he would save the time of the meeting, and he would be repaid by the greater attention bestowed on his communication. With the object of promoting discussion, the Council has of late years set apart certain evenings for debates on special pathological subjects; and that they did not misinterpret the feeling of the Society is shown by the great success which attended the debates on tubercle, cancer, and bacteria, and that the contagion of syphilis, introduced respectively by Dr. Wilson Fox, the late Mr. Campbell de Morgan (whose recent loss we deeply deplore), Dr. Bastian, and Mr. Jonathan Hutchinson. They are now making an attempt to classify certain specimens by setting apart special meetings for the purpose of bringing up from different sources a number of specimens of the same class of pathological lesions, so as to facilitate comparison, and to elicit remarks from those who have paid particular attention to the subject in question. The first experiment will be made to-night by exhibiting a series of specimens illustrative of visceral syphilis, a subject the knowledge of which (thanks to the labours of Dr. Wilks and others) may be said to have originated and grown in this Society. From the list before us, the experiment bids fair to be a great success. Due notice will be given of other subjects to be treated in a similar manner. While this improvement in the mode of conducting our business must, in a great measure depend upon individual members, the Council have not been unmindful of their duty in the matter. From the remarks I have made, it must not be inferred that the work for which the Pathological Society was founded is well-nigh completed. On the contrary, notwithstanding all that has been done, we are but on the threshold of pathological knowledge. The volumes of our *Transactions* contain the replies which death has made in thousands of instances to the inquiries put to her; but in the large majority of diseases she has been hitherto silent as to the cause. Indeed, very often the morbid appearances which we do find in a dead body, and which are exhibited to this Society, are merely the coarse anatomical results, and not the intimate course of the morbid process which has terminated life. We are still in the dark as to the mode and the origin of these morbid processes, as to the beginnings of the disease. In a still larger number of cases, as, for example, in the whole class of the acute infective diseases, death also has not yet revealed either the origin or the mode of operation of the pathological process which has led to the fatal result. Students of our *Transactions* will see that the microscope, to which we are so much indebted for our knowledge of the minute structure of the coarser pathological lesions, has of late years greatly assisted us in unravelling the mysterious changes by which healthy is converted into diseased tissue. Nevertheless, for disclosing to us the intimate pathology of most diseases, we must look for assistance to chemistry and experimental pathology, and it must be confessed that in this direction our Society has as yet done little. Some years ago the Council appointed a Chemical Committee, for analysing and reporting on such specimens as might be submitted to it. Various reasons may be assigned for the fact that its labours have been hitherto few: but the chief has been the difficulty of obtaining material in a condition fit for successful investigation. With death the chemical processes of disease end, and those of dead matter begin, and hence, before the morbid tissues are brought to this Society, they are too often useless for chemical investigation. It may, therefore, be worthy of the consideration of the Council how far it would be possible to assist members, either by a grant of money, or by the assistance of the Chemical Committee, in determining the chemical nature of secretions or morbid tissues in certain cases of importance before they are submitted to the Society. The chemical or some special committee might also be requested by the Council, from time to time, to undertake certain pathological investigations involving chemical research, which it would be difficult for individuals to carry out. It is, however, to experimental pathology that we mainly look for progress in our knowledge of many of those diseases respecting which death has hitherto been silent. It is certainly a matter of regret that few of those brilliant researches in experimental pathology, which of late years have been made in this country by Dr. Burdon Sanderson, Dr. Klein, Professor Lister, Dr. Bastian, Dr. Richardson, Dr. Kirkwood, and others, have been communicated to this Society. In fact, if we except the valuable communications on artificial tuberculosis made by Mr. Simon, Dr. Burdon Sanderson, and Dr. Wilson Fox, that of Dr. Burdon Sanderson on infective agents in pyæmia, those of Dr. Bastian on the migration of blood-corpuscles through the walls of the blood-vessels, those by Dr. Cobbold on the production by experiment of cystic entozoa, and those by Mr. William Adams on the reparative process in the tendons of rabbits after division by subcutaneous or open wounds—if, I say, we except these, our Society has contributed little towards the advancement of what, without fear of contradiction, I may call the most important branch of modern pathology. It might possibly promote researches of this nature among its members, were the Society to institute a medal to be awarded once in two or three years, to the gentleman who, in the interval had communicated the most valuable results obtained from such researches. I throw this out as a suggestion, without any authority from the Council; but it seems to me that the very existence of such a medal would be a standing evidence of the desire of this Society to encourage investigations of the description I have referred to. At all events, of this I am sure, that many of our members are thoroughly competent to undertake and carry to a successful issue such investigations. And now that laboratories for practical chemistry and physiology exist in most of our medical schools, I trust that the Society will no longer incur the reproach of lagging in the rear in this matter; and that, before long, we shall have communications before us which will reflect lasting honour on the contributors, and redound to the credit of the Society. Meanwhile, I am glad to be able to inform you that a commencement has already been made in the direction I have indicated. The Council have to-night decided to apply to the Government Scientific Grant Committee for a grant of money, to enable the Council of this Society to undertake and organise investigations into the intimate pathology of the morbid processes commonly designated pyæmia, septicæmia, and purulent infection, having special reference to their various causes. Should the scheme be carried out, we have

reason to anticipate results of the highest possible importance. After reading the list of the papers to be brought before the Society during the present session, the President said: In conclusion, I feel confident that this Society, which in the past has done so much to advance our knowledge of pathology, will continue to do so in the future; that it will maintain its claim to be, not merely a society for the prosecution of morbid anatomy, but to be truly, as its name implies, The Pathological Society; and, more especially, that it will not be unmindful of its mission to promote the elucidation of those important problems, which are not only the most important and interesting in modern pathology, but the solution of which is of surpassing importance as fraught with incalculable benefit to the human race; so that, in time to come, when most of us have perhaps passed away, it may truly be said of all diseases, *Nec silet mors.*

SURGICAL SOCIETY OF IRELAND.

THE Third Meeting of the Session of this Society was held on Friday, January 7th, 1877.

In the absence of the President and Vice-President, the chair was occupied by Professor STOKES, Senior Member of the Council present, and then by Mr. HENRY TYRRELL.

OPERATION FOR THE RESTORATION OF THE LOWER LIP.

Mr. TYRRELL made a communication to the Society on the restoration of the lower lip, when the old lip has been entirely destroyed by ulceration. He did not pretend to say that he had anything original to communicate, but he thought that the method he had devised would tend to render the operation capable of being more easily performed, and, perhaps, done with greater precision. Mr. Tyrrell exhibited two photographs of a patient, sixty years of age (one taken before, and the other after the operation), who was admitted for treatment into the Mater Misericordiæ Hospital during last summer. He had been the subject of epithelioma of the lip for three years, and had been under the care of several quacks, who applied blisters, &c., to it, and at the time of his admission to hospital the entire lip, from commissure to commissure, was destroyed, and before any operation could be effected, the square portion constituting the entire face from the lip to the chin should be removed, otherwise there would have been no use in operating, and he thought at first it would be very difficult to restore the lip. In the operation that was most frequently done, Symes' operation, in those cases of extensive disease, he advised the surgeon to make a triangular incision from the commissure of the lip, on either side, down to the chin, and then to prolong it upwards, but it was quite evident in this case that no triangular incision that could be made would include the entire of the disease, or that that operation was not to be commended. Then Buchanan's operation, of which his (Mr. Tyrrell's) was somewhat of a modification, as the Society were aware, consisted in making two incisions, but that operation, also, would not answer in this case, as sufficient of the soft parts would not have been procured to fill up the enormous gap. The breadth of the lip was three inches, and he naturally had to obtain sufficient to cover the teeth, so that he made a vertical incision, first having removed the entire of the diseased part from commissure to commissure, towards the bone, and it struck him that the length of the incision should be half the breadth of the lip. The point, therefore, that he wished to insist upon was that, in order accurately to determine the length of the vertical incision, it should be half the breadth of the lip, because the two halves made a whole, and when those two halves were applied (refers to diagram) they would exactly form the proper size. The operation was completed after Buchanan's method, there being, as he had before observed, a single vertical incision, the length being half the breadth of the lip, and then continuing it outwards, right and left, and dissecting the flaps, they were turned round to the two points (diagram), so that the lip was formed. That the operation succeeded was evident from an examination of the photographs, which showed that it was very successful indeed. If the incision were made too short in the first instance, it could not be rectified, inasmuch as it had been prolonged outwards, and if they made it too long, they did more than was necessary. Six months prior to this case he had a very similar one, in which he performed Buchanan's operation, but the mouth in that case was too small. He wished to remark that that operation, although an admirable one, and one which should be undertaken, was, after all, a very poor one; that was to say, that although they might call it restoration of the lower lip, it was indeed so in a very limited sense. If they could get sufficient of the soft parts to cover the teeth, and to prevent saliva and food from dribbling over the mouth and chin, that was all they could effect. They could not have a lip in the true sense; it would not be a muscle of expression, it would be fixed and not expressive of emotion. Such was the fact in the case that he had now brought before the Society. Before the operation he took care to ascertain that the glands below were not engaged, and that it was a case in which some operation should be attempted. He had looked into the books for information bearing on the cases as far as he could, but he did not find any reference to this mode of proceeding; and he had also asked one whom they all knew was an authority, Mr. B. W. Richardson, one of the hon. secretaries of the Society, and he, too, was not aware that this peculiar mode of operating had been brought before the profession previously. He desired to take that opportunity of mentioning that he had written a paper upon what he called needle guards. He wished to state that he did not now believe they were worth anything. When needles were difficult to remove they disturbed the wound in cutting the needles with the ordinary pliers. In the Mater Misericordiæ Hospital he had used a very simple method of breaking needles, which any practitioner without additional instrument could effect. The needle which they used for hair lips and these plastic operations was the ordinary triangular spear-shaped needle, which he believed was acknowledged to be the best, and if they took and transfixed a piece of chamois leather to represent an ordinary suture, of course the object was to cut it off sufficiently short without disturbing the soft part, all they had to do was to grasp the needle at one end, or seize it with an ordinary forceps, and by the method he recommended to break it off with another forceps, in which it remained.

The CHAIRMAN said that there were no operations in surgery in which the ingenuity of surgeons had been so much engaged as these plastic operations; and the one that Mr. Tyrrell had brought before the Society appeared to be a new one that was given them in addition to the large number already existing. Unquestionably, the photographs showed the result of the operation to be most satisfactory.

Mr. TUFNELL asked did Mr. Tyrrell find the exposed surfaces to contract and manifest a disposition to draw down the mouth?

Mr. TYRRELL replied that when the parts were brought up there was no tension.

Mr. RICHARDSON could corroborate everything that Mr. Tyrrell had said regarding the advantages of this operation, having seen the man in the Mater Misericordiæ Hospital. He never saw a better artificial lip, if he might use the expression, than this one.

(To be continued.)

DUBLIN OBSTETRICAL SOCIETY.

THE Second Meeting of the Session was held on Saturday, December 9th, 1876, the President, Dr. DARBY, being in the Chair.

Dr. HENRY KENNEDY read some Notes on Diphtheria, which will be found on page 61.

Dr. M'SWINEY said they had in England, France, Italy, and Germany a pretty general consensus to the statement of the identity of pseudo-membraneous croup and tracheal diphtheria; but the physicians of those countries were careful to discriminate when they spoke of croup and said they meant the disease, the pseudo-membranous exudation from the mucous membrane. On the question of the identity of inflammatory laryngitis with true exudative croup, the supporters of that theory were challenged to produce a single example of exudation, the result of inflammation of the larynx. Sir William Jenner asserted that no anatomist could by possibility discover the smallest difference between the false membrane of diphtheria and the so-called exudation of inflammatory croup. Notwithstanding these facts, Dr. Kennedy had manfully come forward to sustain the opposite view, and verify the statements of Dr. West, a distinguished authority, who maintained with Dr. Kennedy that they were two distinct affections.

Dr. MONTGOMERY said that a member of his family, a boy, 11 years of age, when in the fourth week of an attack of

typhoid fever, was affected with diphtheria. He had distinct aphonia for a long time afterwards. and his recovery was very slow. The liquid extract of yellow bark was used in that case, and he (Dr. Montgomery) thought that might be looked on as a very favourable preparation given in proper doses. On a review of the case he thought that though the appearance of the diphtheria was very alarming, certainly after its appearance the severe symptoms of the fever began more or less rapidly to subside.

After some observations from Dr Byrne, Dr. Kennedy replied.

MEDICAL MICROSCOPICAL SOCIETY OF LONDON.

At the last meeting of the Medical Microscopical Society, Mr. Golding-Bird read a paper

ON RODENT ULCER,

illustrated by drawings and specimens. Having reminded his hearers of the generally-accepted clinical characters ascribed to the disease, he proceeded to analyse the cases published by the principal writers upon the subject from the time (1827) of Dr. Jacob, of Dublin. Referring only briefly to their clinical aspect, he dwelt upon the descriptions given of the histological appearances; but it was much to be regretted that so few of the large number of cases reported had been submitted to reliable microscopical investigation. From this he, however, concluded that the principal English authorities are agreed now upon the disease being non-cancerous and non-epithelial, but a small-celled growth comparable to the edge of an ulcer rather than to anything else. Some observers make a special arrangement of the cells into columns or circular aggregations, considering this latter essential. With this the author of the paper did not agree; he did not think such a precise arrangement essential, but rather accidental—or, if essential to some varieties of the disease, we did not know yet what clinical distinctions corresponded to them. Dr. Warren, of America, Billroth in Germany, and Ranvier in France, all class the disease under cancers, and describe the presence in greater or less degree of epithelial infiltration. Such a view the writer had, from microscopic investigation, not been able to uphold; and he thought that everything—at least from the clinical aspect—militated against it. Dr. Warren was the only writer, as far as he knew, that had insisted upon a peculiar arrangement of the fibrous tissue. This he had also noticed. Mr. Golding-Bird then gave a detailed account of three cases, in one of which there were two returns of the growth after extirpation, and in these he had found an excessive infiltration of small round cells, similar to those of ordinary inflammation rather than to true epithelium; no definite arrangement of the cells; no transition between them and the epidermis, and no projection unduly of the latter down into the cellular tissue; a great abundance of fibrous tissue, formed apparently from the intercellular material; it lay as much under the granulating part of the ulcer as under the skin around; its direction was mostly ascending towards and at right angles to the free surface. It seemed to come from bundles, that threw out bold curves of the tissue on either side, so that under a low power almost a tree-like appearance was seen. It is this that is referred to and figured by Warren. In all cases the great excess of fibrous tissue making its way where the induration extends, even close under the free surface of the granulations, was remarkable. In short, he agreed with English observers generally in the non-epitheliomatous character of rodent ulcer, but thought that the great excess and peculiar situation of fibrous tissue as much a distinctive mark as any peculiar grouping of the cells, and ventured to suggest that the so-called nests of epithelium described by some writers may only have been normal epithelium—*e.g.*, of hair follicles, very obliquely cut.

Mr. Fred. Durham expressed his belief in rodent ulcer being a small-celled growth and non-epitheliomatous.

Mr. Giles quoted an instance of normal epithelium having been mistaken for nests of epithelium in a sarcomatous growth.

Mr. Henry Morris, rather from the clinical aspect of the disease, considered rodent ulcer as quite distinct from epithelioma, though not able to say what microscopic diagnostic character it might possess. He had only that day examined a case of thirteen years' duration that had excavated the face, and he had found a markedly tabular arrangement of the cells, similar to the cases described by Mr. Hulke and referred to in the paper.

Registered for Transmission Abroad.

THE
MEDICAL PRESS AND CIRCULAR
is published every Wednesday morning. Price 5d. Post free, 5½d.

Post Free to Annual Subscribers £1 2 6
,, If Paid in Advance 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—
A. A. Tindall, 20 King William Street, Strand, London, W.C.
A. H. Jacob, 23 Ely Place, Dublin.
Maclachlan and Stewart, South Bridge, Edinburgh.

Subscriptions for France are received by Messrs. Bailliere, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

Subscriptions for the United States are received in New York, by Messrs. Willmer and Rogers; Baltimore, by Messrs. Kelly and Piet; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 24, 1877.

UNQUALIFIED MEDICAL ASSISTANTS.

We, and the profession generally, may thank our correspondent, "An English Practitioner," for drawing attention to a subject which has now been for a long time treated with a great deal of neglect; so much so, indeed, that the evil to which we refer is the same now as it was many years ago, when it, as we well remember, excited much discussion among members of the profession. The scandal attached to the practice of medicine by unqualified assistants is to be particularly deprecated at a time when not only illegal and irregular practitioners are being called to account and prosecuted more than they have ever been before, but so much is being done to raise the standard of medical education, and to guarantee the qualifications of those into whose hands the health of the public is to be entrusted.

Recently, as our columns have shown, the Medical Defence Association has attracted much attention, and obtained much credit for the persistency with which it is ferreting out some of the more notorious quack and medical impostors who, in this and other large towns, are for ever trading upon the ignorance and credulity of the masses. But as our correspondent very justly observes, however laudable it may be to carry on a crusade against men who usurp the functions of the physician, *outside the pale of the profession*, it will still better serve our interests and elevate our dignity, when it is dedicated to internal reform, and when the practice of visiting and prescribing by unqualified men, under the sanction of Fellows and Members of our Colleges." Although we hope there are not many practitioners who engage assistants who have not so much as undergone a course of medical education, we have only to look over the advertisements in the different medical journals to see what a number of men there are practising our profession, who have no more claim to practise it than any one of those

who have been recently prosecuted under the Medical Act. Nor can this system of engaging as assistants unlicensed practitioners be defended on the plea that these assistants only act under the supervision of their employers, and that therefore patients run little risk of suffering through their ignorance or neglect. The practice of medicine is one of those arts in which a great deal of mischief may be done in a very short time. It is only necessary for the principal to be absent or professionally engaged, to give the assistant an opportunity of displaying his inability to take charge of the patients entrusted to his care, or of committing some great blunder that may jeopardise not only his own reputation, but that of his employer also. Many years ago we heard of an assistant prescribing two or three grains of elaterium, but, fortunately, the prescription was seen by the principal in the day-book before it was made up. In this case the assistant was actually a M.R.C.S. In another instance, we recollect five grains of powdered squills being ordered for a parish patient, a mistake which was followed by alarming symptoms. Besides, it should not be forgotten that very great responsibilities often attach to the position of a medical assistant. He may have a difficult case of midwifery under his care, and far away from any help. He may have to take the entire charge of the practice during the temporary absence or illness of his employer ; and, what is of more frequent occurrence, many of the parish and club patients are placed almost entirely under his care.

It follows, therefore, that there is a large class of men practising medicine in this country with little or no qualification, and who, nevertheless, are not only not interfered with, but are really protected by the very members of the profession who are ready to bring down all the vengeance of the law upon certain illegal and irregular "Drs." practising on their own account. The inconsistency of this conduct on the part of the profession, their apathy in the matter, and still more the apathy and indifference of the great medical corporations, are to be much regretted; and we perfectly agree with "An English Practitioner" in thinking that the time has now come to strike a blow at an evil that has developed in our midst in spite of protestations, and in defiance of all the laws that have been framed for our own protection.

The question, however, is how best to put a stop to the system complained of. The subject is a difficult one to deal with, and, in our opinion, the difficulty must be surmounted either by the voluntary action of medical principals themselves or by the interference of the Government. One reason why there are so many unqualified assistants abroad is the difficulty of getting fully qualified assistants, and the comparatively low salary at which unqualified men may be engaged. Considering, however, the large income of most practitioners who are in the habit of keeping assistants, there is no reason why the salary of a fully qualified man should not be much higher than it is ; especially as the increased outlay on the part of the principal would be amply compensated for by the greater liberty he would enjoy. Hundreds of country practitioners are now prevented from ever taking a holiday and recruiting their severely taxed frames through not having a qualified assistant in whose abilities and good faith they can put implicit confidence. If, however, our country *confrères* make no move in the matter, in all probability it will not be long before the Government will be induced to take some steps to remedy the evil. It was, as our correspondent observes, clearly the intention of the legislature, when it granted the Medical Act, that none but those who had passed a proper examination and obtained a licence should either visit or prescribe. Nevertheless, even were there any one—as we very much doubt—disposed to do so, none of these unqualified assistants could be prosecuted under the Medical Act. The law is quite silent on the subject of medical assistants, and the words "who wilfully and falsely pretend to be . . . a practitioner in medicine, &c.," would not apply to them. It is, however, to be hoped that there will be no need of any Government interference, and that through the representations of the medical press, or the influence of the Medical Council and other medical corporations, members of our profession will be induced to forego altogether the employment of unqualified assistants, and will no longer connive at a practice which they condemn in others, which is attended with much mischief to their patients and inconvenience to themselves, and which, moreover, is of so derogatory a nature as to bring medicine down to the level of a trade, instead of raising it to the dignity of a science.

PROFESSOR TYNDALL'S MOTES AND GERMS.

On Friday evening last, Professor Tyndall once more indulged the members of the Royal Institution with a discourse on "Motes and Germs." On a previous occasion he stated that, besides repeating the experiments of others, and taking such additional precautions as suggested themselves to him to ensure reliable results, the principal apparatus on which he should rely was that in which his tubes containing the infusions were placed in boxes with their insides smeared with glycerine, which caught and retained the "motes" as they settled. Glass windows in the sides of the boxes allowed the passage of a beam of light from an electric lamp. This was the test employed for the purity of the air, there being no trace of the beam through the box when there were no "motes." In all cases the air was allowed time to purify itself by the settlement of the "motes" before the infusions were introduced by a pipette into the tubes inserted in the bottom of the boxes. Five of the cases of tubes shown last year (containing pheasant, herring, pork, beef, and mutton) were now exhibited and appeared to be as perfect in clearness as they were a year ago.

Another series of experiments was commenced in September last consisting essentially of repetitions of last year's experiments, but, to the professor's great astonishment, all the earlier ones produced very unexpected results. The first referred to were infusions of fungi collected by "two members of the institution" in Heathfield Park. The infusions were made with the usual precautions on Oct. 30, and they all showed turbidity, and immediately after were swarming with animal life. Of infusions made on Nov. 1 some remained clear, others went bad. Cucumber and beet-root were tried on Nov. 7, and in three days all went

bad; they were turbid and covered with a fatty scum. On Nov. 20, infusions of cucumber, beet-root, turnip, and parsnip were prepared upstairs in another room, and the additional precautions of filtering the turnip and beet-root through 24 layers of filter-paper, the cucumber through 120 layers, and the parsnip of 300 layers, were adopted. For convenience, however, the boiling with the oil-bath was performed in the laboratory. Soon all the tubes were swarming with life. Again, on Nov. 25, experiments were repeated, with the additional precaution that the boiling was also done in the upper room, still all went bad. Again, the process of calcining with platinum was adopted, with increased heat and greater time than usual, with a like result.

Results so diametrically opposed to those of last year were sorely puzzling, and Professor Tyndall at once looked for the cause in the impurities of the air of his laboratory. Closer investigation also showed that there was a risk of air entering the tubes with the liquid. The usual pipettes were therefore discarded, and a modification of what is known as Robert's tubes was adopted. No bubbles of air were allowed to pass, and then the infusions remained good. A point of interest about the investigation was that the air of the laboratory was found to be full of dried particles of old hay—hay that had been used during the last twelve months; and direct experiment proved that the time found sufficient for boiling infusions of new hay is not sufficient to render sterile the "motes" of dry old hay. Here was the explanation of the difficulty. The air of the laboratory was infested with germs from the old hay.

To make quite sure of his facts, Professor Tyndall had his experiments repeated at the new house at Kew and elsewhere, and these so far proved confirmatory of former results. It is not, however, for a moment contended by his opponents, as he seemed to insinuate, that he has prejudices against the doctrine of spontaneous generation. Neither is it a matter of dispute that hermetically sealed boxes or tubes do remain an indefinite time entirely free from all liability to change, but it is doubted whether Professor Tyndall's beam of light shows that in his opinions spontaneous generation will not take place, and whether the motes and germs he lays so much stress upon are a necessary element in the production of life. It is pretty evident that other proof than that afforded by his searching beam of electrical light must be forthcoming before it demolishes the experiments and theory of Bastian.

CERTIFICATES OF DEATH FROM SMALL-POX.

In one of his last official Reports the Registrar-General asks:—To what extent has vaccination, as it is usually performed, protected the population of London against death by small-pox? The returns of the year 1876 answer this question to a certain extent. 735 persons of all ages died of the dire disease; 325 were returned in the medical certificates as unvaccinated, 219 as vaccinated, while of 191 the fact is not spoken to. Thus, in 544 deaths the proportions in every 100 were found to be, 60 of persons unvaccinated, 40 of persons vaccinated. The proportions of the unvaccinated were greater in the hospitals, where every case was classified; so that out of 735, including the due proportion of the uncertified, 439 or more were unvaccinated, and 296 were vaccinated at some time, and in some way or other. If the numbers unvaccinated and vaccinated among the living were known, it would be easy to determine the mortality of the two classes; but in the absence of an actual enumeration of the vaccinated, all that can be asserted is, that out of a comparatively small number of persons unvaccinated 439 died, while out of the great mass of the vaccinated population 296 died.

With regard to these observations, we shall in the first place remark that the bare statement that a certain number of "persons vaccinated" contracted and died from small-pox, says very little against the protective power of vaccination, unless it were shown that in nearly all the cases the younger patients had been properly vaccinated in infancy, and that those who had arrived at adult age had been also re-vaccinated. This fact, and the possible fallacy it involves, show the necessity of ascertaining more exactly the degree of protection which our patients apparently enjoyed at the time they were fatally attacked with the disease.

Then, again, the large number of cases always "unaccounted for," should be deserving of serious consideration, more especially as this failing in our medical statistics is made a handle of by the anti-vaccinators to bring the operation altogether into disrepute. Thus in the 35th Annual Report of the Registrar-General, it is stated that 19,094 persons died of small-pox, and that 1,888 were vaccinated, and 3,782 unvaccinated, thus leaving 13,424 cases unaccounted for. In reply to this fact, which has been retorted by the Anti-Vaccination League, the Registrar-General replies that this large number is unaccounted for simply because he had no information on the subject. But this unavoidable defect in the Registrar-General's statistics is stigmatised by the League as a "bare-faced fraud, which discredits not only the Registrar-General himself, but the whole body of medical vaccination statistics, trumpeted abroad in defence of a murderous law!" The insolence and absurdity of such a charge are so evident that it would be a waste of time and trouble to refute it. The above quotation is to be found in a handbill which the "President of the National Anti-Compulsory Vaccination League," a clergyman of the Church of England, has allowed his wife to sign; and as this precious handbill is said to be doing harm among the ignorant people in the neighbourhood in which it is circulated, the Registrar-General has been urged to prosecute the woman who wrote it. He very properly, however, declines to do anything of the sort, or to do more than to bring it under the notice of her Majesty's Government.

If we had no better proof of the efficacy of vaccination than that afforded by the imperfect certificates of death made out during great epidemics of small-pox, the anti-vaccinators might have some reason to complain. Fortunately, however, the proof of the all but perfect protection afforded by vaccination and re-vaccination, rests upon other evidence of so strong and convincing a nature, as to render the imperfection of these certificates, and the want of information complained of by the Registrar-General of much less moment than might be supposed. Nevertheless, inasmuch as the more recent the evidence, the greater influence does it have on the mind of the

people, especially at a time when hundreds are dying from the disease, the careless manner in which certificates of death are made out is much to be regretted. Not one weekly return of the mortality due to small-pox has been published since the commencement of the present epidemic, but there has been a large number of cases in which there was no information given as to whether the unfortunate patient had been vaccinated or not. We are therefore glad to see that in his last Report the Registrar-General strongly urges medical practitioners to append to their certificates of death after small-pox, whether the deceased had or had not been vaccinated. Our confidence in the protection afforded by vaccination is too great to fear the most searching inquiry that can be made on the subject, and therefore, it is to be hoped that both in this, and in future epidemics, every member of the profession will comply with the above very reasonable request. And indeed, not only should it be stated whether the deceased had been vaccinated, but in the case of adults, whether they had been *re-vaccinated;* and, further, whether the "marks" of vaccination were, or were not, of a satisfactory nature. In cases where there is any doubt about the matter, such doubt should be duly registered. By this means, we hope to have in time a large body of reliable statistics, which would not only be a further proof of the protection afforded by vaccination, but would also show to what extent, and with what efficiency, the operation, voluntary or compulsory, was practised throughout the kingdom.

Notes on Current Topics.

Army Medical Department.

THE future of the Medical Service of the Army is now hanging in the balance and must soon be decided, to end in a bright future or premature and undeserved decay. The importance of a contented, united, and efficient medical corps is too well known to require comment from us. To reconcile the different views held by officers of various grades on the best form of its organisation we will not attempt, but of one thing we are assured, that no staff corps will be accepted by the service or the profession which does not grant to the officers of the department every privilege, pecuniary allowance, and honour of the corresponding relative rank in the army. The day is rapidly passing away when members of the medical profession will consent to be placed in positions of inferiority to boys just out of their teens, or to others whose only claim to social position is their combatant commission. The Army Medical Department numbers amongst its members many amiable and estimable men, and others who in any walk of life would have succeeded to positions not inferior to the most brilliant which have been accorded to many of their civil contemporaries. There are, of course, the tares, who are neither an ornament nor an advantage to their department. On the whole comparatively few they soon sink to the level best suited to their tastes and acquirement. For such discontented spirits we have little sympathy, and it would be an immense advantage to the army, in our minds, if they were allowed to leave the service with a recompense proportionate to their merits, to make a fresh start in more congenial spheres. As to the many officers who are endeavouring by their example and work to bring their department to the front, we would wish them every success and encouragement in their efforts, for upon its professional status the department must stand or fall in the estimation of the army.

We concur in every expression of a contemporary as to the causes which have conduced towards making the Army Medical Department unpopular. The causes lay with the Horse Guards and War Office to a very great extent. Numerous warrants granting privileges with one hand while taking away with another. Miserable, misplaced, and petty economies, impeding efficiency, and leading only to discontent. A niggard distribution of honorary distinctions, which the surgeon was equally entitled to with the combatant. No increase of pay to the senior officers, nor inducement to retire at an earlier period. Half-pay before an officer has had time to recover from the effect of some serious disease contracted in and by the service; and last, though not least, a salary contemptible for an officer holding the high and responsible position of Director-General of the Medical Department of the Army, and we should not forget to add the non-command of their own corps subordinates, the charge of stores which might be more suitably delegated to commissaries of hospitals. We would commend these facts to the War Office, and advise a speedy return to the wise and generous policy of sixteen years ago, if they wish to obtain medical candidates for Her Majesty's service.

Munificent Bequest for a New Hospital in Paris.

M. EMMANUEL MOIANA, lately deceased, has bequeathed to the city of Paris the sum of one million francs (£40,000), 500,000 to be devoted to the construction of a hospital, 500,000 to be invested for its endowment. Commenting upon this, the editor of *Le Paris Medical* thinks the money would have been better employed in founding a free school of medicine, to which the name of Moïana would have been everlastingly attached. As, however, M. Moïana has not done so, he hopes some other rich and generous millionaire may adopt the suggestion.

An Adulterator's View of Anti-Adulteration Law.

A CORRESPONDENT of the *Chemist and Druggist* designates the existing method of detecting frauds as "one of the most degrading, inquisitorial and odious social organisations in this country, viz., that of public analysts." This is the most forcible testimony we have yet had to the good effect of Mr. Sclater Booth's Bill, and a sad instance of ingratitude to that gentleman who certainly exerted his ingenuity to frame a measure which would give the dealers in falsified goods very little trouble.

THE death-rate has not been so low in London for several years past as at the present time, notwithstanding the great increase of small-pox. Probably, no large city or town in the world has so low a death-rate as 20 per 1,000 at this season of the year, thanks to its sanitary administration.

Medical Council Blundering.

THE Medical Council is certainly erecting for itself an edifice of professional disapproval the grandeur of which few public bodies have ever emulated. It is absolutely without a friend, and while—in professional circles—the mention of the august body is sure to evoke a chorus of sneers and abuse, not even the most lenient critic is heard to say a word in its defence. Truly it does not deserve an advocate; and that it exists at all is due to the fact that the profession has no power to abolish it, but is bestridden by its Old Man of the Sea, and, *multa gemens*, must carry him. The Medical Council seems to court unpopularity. Recently it had a little office to give away, and a concourse of capable medical candidates from whom to select, yet it insulted its own principles and the medical profession by passing over the whole of them in favour of a schoolmaster. Still more lately it has acquired fame by its discreditable conduct towards the Defence Association. This Association applied to the Council to give up its claim to the fines which might be recovered from quacks in order that these sums might go towards the cost of prosecution. The Medical Council benevolently conceded the point, and the Association proceeded with more numerous and more expensive prosecutions on the strength of the concession. Having incurred heavy expenses, it again appealed to the Council for the money, when it discovered that the Council is not entitled to the fines at all, and *that the Council knew that fact at the time the promise was made.*

A Cure for Dipsomania.

UNDER this heading, the *Globe* calls attention to a remedy for drunkenness, which a correspondent of the *Manchester Courier* declares he has personally employed on his own spouse with the very best results. Having found rougher treatment (especially what is called by his countrymen in Yorkshire "puncing") to be of little use, he bethought himself of an expedient which would have done credit to much wiser heads than his. He neither whipped, nor kicked, nor otherwise brutally assaulted his better (?) half. He merely procured a pot of black paint, with which he so thoroughly besmeared her face as to convert her at once into a negress. This had the desired effect. She, who had previously been so incorrigible and had resisted all attempts at reformation, remained sober for a whole month. Whenever the woman has a relapse he administers another dose of the same specific, and he reports that it never fails to secure him the same period of domestic happiness. With respect to this ludicrous, yet happy, expedient, the *Globe* suggests that it would be well if the law stepped in to paint the faces of drunken husbands; but our contemporary must have forgotten for the moment that such a punishment would act very unequally in the two cases, and that what would be most acutely felt in the one case would be only laughed at in the other. Our rough, but honest, Yorkshireman had evidently a keen knowledge of human nature, and especially of the little weaknesses of the fair sex, when he planned this excellent manœuvre. The vanity of women, charming as it often is, is a feature of their character which is daily taken advantage of in more ways than one; but that a knowledge of this frailty should be made use of in such a low and prosaic matter as that of drunkenness is a novel episode in the checquered history of modern society. To disfigure a woman's face, even for a time, is an offence which she will not readily forgive, or a punishment which she can scarcely bear; and if all cases of dipsomania in the female sex went so far as to produce insensibility to such an operation, we should soon hear the last of those distressing cases which are bad enough in men, but which are still more deplorable in women.

Sanitation at Cambridge.

IF we may judge from a report of a recent meeting of the Cambridge Improvement Commissioners, held at Guildhall, the authorities of that town are quite alive to the necessity of doing all in their power to improve its sanitary condition. Their Sanitary Committee reported that the surveyor had laid before them amended plans for disinfecting-house, apparatus, and sheds, proposed to be erected at a cost of about £500. Moreover (according to the report of Mr. Anningson, the medical officer of health), Cambridge is just now fairly salubrious. The total number of deaths for the quarter ending Dec. 31st was 135. Exclusive of members of colleges, this gave a death-rate of 16·4 per thousand, which may be considered very satisfactory, considering that the average death-rate of towns of similar size is about 19·37 per thousand.

The Water Supply of London.

IT might have been confidently predicted that the serious inundations of the past month would produce some dangerous contamination of the water drawn, for domestic purposes, from the Thames and other rivers by the several water companies. We are, therefore, not surprised to learn, from Major Bolton's report, that the state of the water in the Thames and Lea was very bad during the month of December. From an examination of the River-books kept at the intakes from the Thames, it appears that this is the worst flood that has occurred in that river for many years. While these floods prevail the water companies unprovided with sufficient storage reservoirs are compelled to take in dirty water, and distribute such as they can get through their filter-beds, imperfectly filtered; there is a considerable amount of solid matter in the water, and as it is too fine to settle, removal by filtration alone becomes a difficult matter, as the impurity can *only practically be got rid of by subsidence previous to filtration.*

The reports by Dr. Frankland during the past year tend to show that the deterioration of the waters of the Thames and Lea by sewage pollution continues, and point to the necessity of measures being adopted to prevent the contamination of these rivers and their tributaries by the people living on the upper reaches, who now treat the tributary streams, as well as the rivers, as common sewers, both at their sources and during their course. The Thames was in high flood during the whole of December, and its water was loaded with organic impurities of the most disgusting origin. The Southwark and Vauxhall Water Company are, it appears, adding insult to injury in their dealings with a large

suburb of the metropolis. The Richmond Vestry, it will be remembered, objected to pay for dirty water, and protested against the unfair way in which the company treated the inhabitants. The directors were indignant, and threatened to stop the supply; and this has actually been carried into effect during the past week. The papers teem with letters of complaint, but all to no purpose; for the great water company has determined to turn the water down the public sewers rather than that the people of Richmond shall partake of it. Such arbitrary conduct on the part of a water company plainly shows that the water supply of towns should not a day longer be left in the hands of private speculators, and of those who care far less for the public health than for dividends.

Poor-law Medical Officers' Association.

We are sorry to see that this excellent Association is not prospering so well as might have been expected; want of contributions and of unanimity amongst Poor-law medical officers, apathy, and the fear of offending authorities being the alleged cause of the want of success. The objects of the association are :—The adoption of the dispensary system in all large towns and rural districts; compulsory superannuation after twenty-five years' continuous service, and increased remuneration for services where clearly called for. The Association also forms a board of reference in all cases of oppression on the part of authorities. For convenience of their provincial members, they have secured 3 Bolt Court, Fleet Street (the rooms of the first Medical Society of London), where members (whose subscriptions are only 5s. per annum) can meet each other from twelve to five, and where Council and General Meetings will be held at stated intervals.

Medical Aspects of Drug Adulteration.

The very indiscreet palliation of drug adulteration by the *Lancet* in its recent editorial remarks upon the "milk of sulphur" frauds has been speedily seized upon by the *Chemist and Druggist* and the *Pharmaceutical Journal*, the special organs of the adulterators, and placarded in their columns as the opinion of the medical profession. "Medical opinion," says the former journal, "if the *Lancet* is to be taken as an authority, has at last veered round." We venture to assert, and to appeal for proof to the dictum of all other professional and scientific journals, that the *Lancet* is *not* to be taken as an authority in the matter, and we believe we may state that the views of our contemporary are entirely at variance with the feeling of medical men upon this subject. All medical practitioners, except the residuum of the old drug-and-drench, gratis-advice-and-dear-medicine school, are agreed that precision in prescribing is above all things to be cultivated, and, setting aside altogether the morality of such a trade, the profession discourages all drugs on which it cannot depend, and of which it does not certainly know the constituents. Thus, tincture of hyosciamus, laurel water, and sarsaparilla are being gradually dropped out of use, and we believe that such a mixture as "milk of sulphur" is never thought of by a physician of any intelligence. The *Lancet*, therefore, does not speak the mind of the profession on the subject, and the adulterators need not suppose that they have any party amongst competent medical practitioners.

Sanitary Improvements in London.

We are glad to see that the provisions of the Artisans' Dwellings Act are soon to be carried out in some of the most unhealthy districts of the City. A deputation from the City Commissioners of Sewers had an interview with the Home Secretary recently, respecting the mode in which they proposed to carry out the provisions of the Artisans' Dwellings Act in the City. Mr. F. Cox, chairman of the Commissioners, laid before Mr. Cross proposals for bringing under the Act three different areas. The first proposal had reference to Fetter Lane, which would deal with houses accommodating 260 persons, at a cost of £32,000. The second referred to St. Luke's district, and would remove houses that accommodated 1,230 persons at a cost of £90,000. The third scheme would deal with property in the district of Whitechapel, removing houses that accommodated 1,150 persons, the cost of which was estimated at £162,000. These three areas would entail an ultimate cost to the City of £284,000. In a long speech, which he made in reply to the deputation, Mr. Cross showed the great and active interest he takes in the matter. He has himself gone over and closely inspected the special localities which the Metropolitan Board of Works proposed to deal with, and he did not think there was a single corner in the City scheme, or in that of the Metropolitan Board, which he had not personally visited. In conclusion, he repeated what he had said in Parliament —that he believed the City of London would set an example to other corporations, and in a few years would show there was not a single place the medical officer could put his finger on that could be termed a plague-spot.

Metropolitan Hospital Sunday Fund.

At a meeting of the Council of this Fund, held at the Mansion House on Friday last, the Lord Mayor presiding, the following noblemen and gentlemen were unanimously elected as the managing body for the current year :—Committee of Distribution—The President; Sir Sydney H. Waterlow, Bart, M.P.; Vice-Presidents, Lord Ashley, Messrs. Alderman McArthur, M.P., Thomas Hankey, M.P., Samuel Morley, M.P., G. W. Callender, F.R.C.S., W. S. Saunders, M.D., J. Smith, and T. Turner. General Purposes Committee—The President and Vice-President, *ex officio;* Bishop Claughton, Cardinal Manning, the Revs. Canon Miller, J. Thain Davidson, J. Kennedy, Professor Marks, G. Bowden, J. F. Kitto, and R. H. Marten; the Earl Cadogan, the Hon. R. Capel, Sir R. Alcock, Mr. Alderman Finnis; Messrs. J. Boodle, H. Brooks, R. B. Carter, F.R.S., S. Hoare, Jabez Hogg, F.R.C.S., J. G Pitcairn, W. S. Saunders, M.D., and E. H. Scott. Hon. Secretaries—Sir E. H. Currie and Mr. R. B. Martin. Secretary—Mr. H. N. Custance. Dr. Glover expressed his opinion that the sums hitherto collected annually in aid of the fund were altogether unequal to the amount that could be desired from all metropolitan churches and chapels, and proposed the following resolution :—"That it be an instruction from this Council to the General Purposes Committee to consider whether any, and if so what,

means can be taken to excite the interest and co-operation in this fund of congregations which have never yet contributed to it, and to increase the interest already kindly displayed in it by the great majority of London churches."

Hospital Accommodation for Small-pox Patients.

ACTING upon a recommendation of Dr. Thomas Stevenson, who some weeks ago, in his capacity as medical officer of health for St. Pancras, reported that there was a deficiency of accommodation for small-pox patients of the non-pauper class, and it was desired that isolation should be carried out to its fullest extent, the sanitary committee took prompt measures to meet the difficulty, by the conversion of a building in Cambridge Street, Agar Town, into a non-pauper small-pox hospital. A sub-committee was appointed to accept tenders for the fitting up of the building, to engage a staff of officers, make arrangements for removals, &c., who carried out their functions with despatch, and on Saturday the building was formally opened by the entire committee inspecting the whole arrangements, which appeared to be of a very satisfactory and adequate character. The necessary preparations for the reception of 40 patients are complete, the nurses and other officers being already in residence. Dr. Harley, of Haverstock Hill, has been appointed medical officer to the hospital, which opened its doors to patients on Monday. A shed for the shelter of infected clothes brought to the disinfecting chamber, to be covered with felt, is to be erected, Dr. Stevenson stating that the present reduction in the number of small-pox cases in the parish was due not only to prompt removals to hospitals, but to the means adopted for disinfection. It is believed the accommodation for non-paupers will now be ample.

A New Theory of Whooping-Cough.

AT the last sitting of the French Academy of Medicine, M. Gueneau de Mussy broached a new theory of the nature of whooping-cough. He considers it an exanthematous fever, the eruption taking place on the mucous membrane of larynx, trachea, and bronchi, causing tumefaction of bronchial ganglia. These ganglia compress and irritate pneumogastric nerves, producing the characteristic convulsive cough. He assigns the persistence of the cough after the *pyrexia* has subsided, to the continuance of the ganglionic engorgement. The vomiting that so often accompanies this disease is also assigned to this cause. He supports his theory by the fact that enlargement of the bronchial ganglia from other causes also produces a convulsive cough analogous to that of pertussis.

We have had many theories on this malady; unfortunately, we have not one remedy.

The French Medical Protection Bill.

THE *Times*, commenting on the measure which is before the French Senate to exclude English doctors from practising in France, says :—

"The system of protection is to be introduced into that which ought to be one of the most liberal of professions, and, as medical men of position will scarcely consent to go to school again and prepare for a foreign examination, medical skill will become practically a prohibited import in France. In fact, we can have little doubt that the ultimate result of such a law as is in contemplation would be to drive, at all events, English visitors away from French watering-places to similar resorts in other countries, where no such oppressive and unreasonable restrictions were imposed on them. Italy and Spain are not so inaccessible as to render Nice and Cannes indispensable. The rights of practitioners already established are said to be respected by the proposed regulations; but when these rights have expired, and when submission to the treatment of none but French physicians becomes a condition of residence in the south of France, there can be little doubt the popularity of this favourite region would soon fade—at least, with English visitors. Such a law would, in fact, like all protective laws, sacrifice the interest of a community to a class; it would ruin places like Cannes and Nice, in order to furnish a delusive gain to the French medical profession."

Magisterial Decisions in Favour of Quacks.

THE quacks must indeed live "in clover" at the present time. Our readers are familiar with the recent decisions in the London police courts in favour of bogus diploma holders. As might be expected, provincial magistrates have followed the lead of their metropolitan *confrères*, by dismissing the charges as soon as they are brought before them. Another instance of this was adduced at the Burnley Police Court last week, when William Brown, of Burnley, was summoned for having wilfully and falsely called himself a doctor of medicine, he being at the same time an unqualified practitioner. The offence was alleged to have been committed on the 11th December last. Mr. Richardson, of Bolton, defended, and showed that the defendant had diplomas from the Pennsylvanian Medical School and the British Medical Reform Association. He was styled in his diploma from the former place as a doctor of medicine, and did not profess to be a member of the Royal College of Surgeons of England, or to be registered under the Medical Act of 1858. The case of Ellis *v.* Kelly, heard before Mr. Knox, at the Marlborough Street Police Court, with the decision upon it, and also the decision in the case of Dr. Hamilton, were quoted to show that the defendant was not liable to a penalty for calling himself a doctor under a foreign diploma, that the case might have been different if he had been summoned under the Pharmacopœia Act.

Following such precedents, there was no alternative but to dismiss the case. It needs but little foresight to predict what terrible consequences will result to the general public by these daily recurring decisions, unless Parliament at once steps in to amend the Medical Act, which is found to be so utterly useless.

Suicide by Poison.

READERS of the daily press cannot fail to have noticed the alarming increase of late, of suicides by poison, especially in London. When the restrictions on the sale of drugs first came into force, deaths from this class of violence occurred so seldom that it was hoped that legislation had at last successfully grappled with the terrible evil. But, unfortunately, that portion of the public bent on suicide soon found means to gratify their propensity; a loophole in an otherwise beneficent Act was discovered, and plenty of shopkeepers were ready to "turn

an honest penny," regardless of the tragic end. In a six-penny packet of "vermin killer" the deadly dose can be bought with impunity, and the seller is not bound by any but a moral law, to ask of the purchaser questions as to its destination. Can it be longer tolerated that five suicides by poison in London alone in almost as many hours should be again possible, as was the case last week? And since suicide is made so easy by enterprising manufacturers and obliging tradesmen, other deaths than self-inflicted ones suggest themselves with an awful significance. So long as vermin exists means will naturally be resorted to for its destruction, but as an unlimited sale of the remedy has hitherto resulted in a terrible cost of human life, "vermin killer" should, as soon as Parliament meets, be placed under the restrictions imposed by the Sale of Poisons Act, and its procuration made as difficult as any of those deadly drugs mentioned in the Schedule.

Mr. Glaisher states that the total fall of rain during the month of December was 5.92 inches, and that there is no instance since 1815 when the fall in tha- month was so large.

There were one hundred deaths from small-pox in London last week; forty-eight of which occurred in the special hospitals, and fifty-two in private houses. These deaths were fewer by sixteen than the previous week.

A monument is to be erected to Linnæus in Stockholm, and will be unveiled on January 10th, 1878, the centenary of the great naturalist's death. The sum of 36,000 crowns has been collected.

The appeal of the English Chemists and Druggists' Trades Union against the judgment of the magistrates in the "milk of sulphur cases" was called on at the Knutsford Quarter Sessions a fortnight since. It was, however, remitted to the Spring Sessions, and will probably not be tried before April.

A "prescribing" chemist, named Frederick Nicholls, of Green Street, Victoria Park, has been fined £20 under the Apothecaries' Act. The defence was that the chemist was acting for a registered medical practitioner, but the evidence was insufficient.

The Home Secretary, replying to a memorial from the British National Association of Spiritualists, urging the "withdrawal of State aid" from the prosecution of Dr. Slade, says, that he can see no reason for altering the usual practice in Dr. Slade's case, and declines to receive a deputation on a question arising out of a criminal case still in progress. Another spiritualist was sentenced to three months' imprisonment, last week, for obtaining money by fraud.

Owing to the prevalence of excessive moisture over pasture-land throughout Europe, cattle plague has again broken out in several countries. In Germany the outbreak is officially confirmed, and the necessary measures to prevent its spreading have been ordered by the sanitary authorities. Cattle exports have been forbidden in many of the Danubian and Austrian provinces, with the hope of limiting and localising the disease.

The preliminary statement of the gross statistics of the Irish Poor-law which has just been issued by the Local Government Board gives the figures for the year ending September 29th. There was a decrease of £2,743 in the total poor relief expenditure, *i.e.*, the workhouse relief exclusive of the dispensary and sanitary expenses. Including these latter items, the total outlay from the rates was £1,049,464, or an increase of £74,420 on last year. Of this very large increase of expenditure nearly £60,000 is to be debited to national school teachers' payments, under the Act of 1875, the remaining £24,000 being almost altogether incurred for extensions of tee sanitary system, the Cattle Plague Act, the Burial Ground Acts, and so forth. The cost of the dispensary, vaccination, and registration systems were slightly less than that of last year, but there was an increase of £1,194 in the item of superannuation. The total amount of superannuation to medical men in the year 1875 was £5,719, so that it would seem that the grant has increased by nearly one-fourth in the past year. There was a decrease during 1876 of 26,000 paupers relieved within workhouses, while those voted out-door help increased by 2,286.

Literature.

MECHANICAL TECHNOLOGY. (a)

The first part of "The Practical Dictionary of Mechanics" is in keeping with the numerous ventures of the firm who issue it—admirably done. There is in it, necessarily, much that is not new, and much that is not true in a practical mechanical sense, but it is clear, comprehensive, and liberally well illustrated. It is in all senses a dictionary, and the present part commences with the "Abacus" and ends with "Air-Compressing Machines," intermediate between which titles we find many forms of instruments for various uses, including Aerators, Abdominal Supporters, Military Knapsacks and Accoutrements, Achromatic Lenses, Acoustic Instruments, and so forth. Should later numbers justify the promise of the first, the subscribers to the issue will have occasion to be well pleased.

Correspondence.

THE ANTI-VIVISECTIONISTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In the last number of your journal there appears an article, entitled "The Antivivisectionists Again," in which you are pleased to mention my name, in connection with an opinion of mine which you quote and characterise as "untrue," following this up with the further statement "exaggeration may pass unnoticed, but not lying."

It is not my intention here to point out how far beyond the limits of legitimate journalism your article goes, when, without asking my reasons for such an opinion, or giving your own in contradiction of it, you give me the lie in the most offensive terms.

When I wrote the opinion quoted by you as follows:—"No student can be expected to come forward as a witness

(a) "The Practical Dictionary of Mechanics." By Edward H. Knight. Part I. London: Cassell, Petter, and Galpin. Pp. 32. Royal 8vo. 1877.

(to these atrocities) when he knows that he would be hooted, mobbed, and expelled from amongst his fellows for doing so," I did so openly and honestly, taking the greatest care to avoid any personality, and with what I considered to be good reasons for my opinion; but while every one was free to differ from me, to suggest that I was mistaken, or to ask me to give my reasons, I was still entitled to expect respectful opposition.

Moreover, by the addition of the words "(to these atrocities)" you connect my opinion in an unauthorised manner with certain exaggerations which I deplore, perhaps, even more than you do, and if, instead of demanding curtly that reparation to which I consider myself entitled, I vouchsafe the reasons I had for expressing myself as quoted, I shall none the less expect the *amende honorable* to be made.

On three different occasions, during my student days, it was my lot to experience treatment such as I have depicted for having dared to give shape to opinions at variance with those of the worst part of my fellow students.

The first occasion was when I remonstrated strongly with some of them against the unmanliness of pelting women and children during a snowball riot.

The second was when I organised and directed a vigilance committee, for the purpose of protecting a most worthy but too amiable professor from the pelting with peas, paper arrows, and even squibs, with which the rowdy portion of our fellow classmates used to annoy him.

The third occasion was while escorting the lady students home through the first great riot in Edinburgh to which they were subjected by their gentlemanly classmates. On this present occasion the treatment referred to was supplemented by a severe kick, administered to me, as I afterwards learnt, by a famous University athlete, who chose the dark, a crowd, and a position behind my back for his purpose, (by a strange coincidence he afterwards died in the Royal Infirmary from the effects of a kick).

Each of these cases would form an interesting historiette if related at length, and, although I feel proud of them and certain that they (as they did in the past) would meet the full approval of the mature members of the profession, they would by no means tend to raise the general character of a large part of the body of medical students.

After such an experience, few unprejudiced persons would hesitate to admit that I had good warrant for the opinion I gave, and in the time which has elapsed since then, things have happened which fully confirm it.

Within the past year I have received several letters from students giving me certain information about cruel vivisection, but begging that neither their names nor the precise cases should be mentioned for reasons similar to those quoted by you. Without, however, insisting on these, I shall offer a good case in point, which happened only a few months ago, and was reported and commented upon by the public press at the time.

Last month Mr. Childs, an F.R.C.S. of England, went to Edinburgh to deliver two lectures against vivisection. The first came off very well and harmoniously, a fact which seems to have attracted the notice of the medical students in that city, for on the occasion of the second lecture, on the 20th of the month, they assembled in force to prevent it. Then ensued one of those disgraceful scenes with which the citizens of Edinburgh are periodically furnished. A howling, hooting mob of students held possession of the hall, and in spite of the entreaties of the venerable Dr. Duff and of Mr. MacLaren, M.P. for the city, who occupied the chair, they refused to allow the lecturer to proceed, and he was forced to leave the hall with his lecture undelivered and unheard.

I therefore submit that I was fully justified in expressing myself as I did, and that the term "*distinct falsehood*," which you have applied to my remark, is utterly inexcusable.

If, instead of referring the matter at once to the proper tribunal, I have taken the trouble to justify my own opinion in your columns by requesting you to insert this letter, I must request that you will give it the same publicity as was given to the libel complained of, and that you will further add to it such an apology as will fully compensate for what was at once an outrage against professional etiquette and medical journalism.

I have the honour to be, Sir,

Your obedient Servant,

GEORGE HOGGAN, M.B. and C.M. Edin.

7, Trevor Terrace, Rutland Gate, London, S.W.

20th January, 1877.

[In justice to Dr. Hoggan we insert the foregoing letter, as we have no reason to doubt the accuracy of his statements. Readers of this Journal will bear us out that we never refuse a hearing to both sides of a question, however much we in our public capacity may feel compelled to condemn the one or the other. We doubted and have reason still to doubt the accuracy of nine-tenths of the statements put forward by the anti-vivisectionists, and we are glad to hear that such exaggerations are quite as strongly deprecated by Dr. Hoggan as by ourselves. We have Dr. Hoggan's assurance that what he has expressed is his opinion and the truth, we therefore willingly withdraw all imputations so far as he is concerned, and regret having mentioned his name in connection with the subject.—ED. M.P. and C.

THE MEDICAL DEFENCE ASSOCIATION AND UNQUALIFIED PRACTITIONERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your issue of the 17th inst. "An English Practitioner" speaks in a very kind manner of the Medical Defence Association, and I am desirous of thanking him for so doing, but he is mistaken in supposing that our operations are directed only against those who are "outside the pale of the profession." We are alive to the necessity of internal reform, and have endeavoured in several instances to put a stop to the practices of those among us who encourage unqualified men in usurping the function of the physician. For instance, we have remonstrated with some medical men who allow unqualified assistants to have sole charge of branch practices, dispensaries, &c., and in cases where persons die who have been attended in their last illness by unqualified assistants, we endeavour to bring about a coroner's inquiry. In one case where a qualified man was in the habit of signing death certificates in cases solely attended by his unqualified assistant, we prosecuted him for issuing a false certificate, but were unable to obtain a conviction. We believe, however that the prosecution has had a very wholesome effect not only on the defendant in the case, but on others who were in the habit of giving similar false certificates.

"An English Practitioner" is quite right in supposing that we ourselves are much to blame for the existence of quacks. They would undoubtedly soon have to seek for the means of subsistence in some other calling than that of medicine, were it not for the encouragement and support they receive from members of our profession. I trust that the day is not far distant when medical men generally will recognise and fulfil the duty they owe to themselves, the profession, and the public in the matter of employing unqualified assistants.

I am, sir, your obedient servant,

GEORGE BROWN, M.R.C.S.,

Hon. Secretary, Medical Defence Association

12 Colebrooke Row, N., Jan. 22, 1877.

Medical News.

Royal College of Surgeons of England. — The following gentlemen passed the primary examination in Anatomy and Physiology at meetings of the Board of Examiners on January 15th, 16th, and 17th :—D. A. Gomes, Bombay; W. Forrest, A. M. Easton, J. C. Baxter, S. M. C. Higgens, J. H. C. Mac and J. Pointon, Liverpool; E. Godson, J. W. Riley, J. W. Moore, and T. W. Colbourn, Birmingham; J. C. Saunders, Sheffield; W. A. Norman, Cambridge; A. W. Gibbs, Bristol; H. C. Shann and R. B. Morley, Leeds; P. Poett, Dublin; R. J. Dearden and S. Hampson, Manchester; J. Wishart, A. H. Wright, D. Fraser, and F. R. Eccl Toronto and St. Thomas's Hospital; W. M'Geagh, Belfast and London Hospital; H. W. Seager, F. D. W. Wheat and L. C. N. Nicod, St. Mary's Hospital; G. H. Russ Guy's Hospital; L. Wills, Middlesex Hospital; G. A. Roper, Cambridge and St. Thomas's Hospital; George Pilkington, Howard Hawkins, and C. J. Fooks, Guy's Hospital; J. H. Henchey, St. Thomas's Hospital and Laval University; A. Fordham, London Hospital; Oswald Roberts and S. C. B. Robinson, St. Thomas's Hospital.

The Clinical Society of London.—At the annual meeting of this Society, held on the 12th inst, the following office-bearers were elected for the ensuing year:—President—G. W. Callender, F.R.S. Vice-Presidents—Herbert Davies, M.D., C. Murchison, M.D., F.R.S., H. Thompson, M.D., R. Barwell, F.R.C.S., T. Bryant, F.R.C.S., C. Heath, F.R.C.S., Treasurer—E. H. Greenhow, M.D., F.R.S. Council—H. C. Bastian, M.D., F.R.S., G. Buchanan, M.D., A. Clark, M.D., D. Duckworth, M.D., C. H. Fagge, M.D., T. H. Green, M.D., J. B. Hicks, M.D., F.R.S., A. J. Pollock, M.D., R. Southey, M.D., C. T. Williams, M.D., W. H. Brace, M.D., F. H. Gant, F.R.C.S., J. W. Haward, F.R.C.S., W. MacCormac, F.R.C.S., F. H. Marsh, F.R.C.S., A. B. R. Myers, F.R.C.S., M. W. Rice, M.D., J. Rouse, F.R.C.S., E. Venning, F.R.C.S., J. S. Wells, M.D. Honorary Secretaries—W. Cayley, M.D., T. P. Pick, F.R.C.S. Cordial votes of thanks were accorded to Sir Wm. Jenner, on the motion of Dr. Patrick Stewart, seconded by Dr. Broadbent, for his services to the Society as President during the past year. Similar votes were also passed to the retiring Vice-Presidents and Secretaries.

Society for Relief of Widows and Orphans of Medical Men.—A Quarterly Court of the Directors of this Society was held on Wednesday, January 10th, in the rooms of the Royal Medico-Chirurgical Society. In the unavoidable absence of the President the chair was taken at 3 o'clock by Dr. Pitman, V.P. The treasurers reported that there were 58 widows and 11 children applicants for relief from the general fund, and 4 children from the Copeland fund. A sum of £1,257 10s. 0d. was voted to be distributed among them. The expenses of the quarter were £65 15s. 9d. The deaths of two widows were reported by the Secretary; one had been receiving grants since December, 1828, and the other since September, 1847. One fresh application from a widow was considered and admitted. At Christmas last a sum of £323 had been distributed as a present out of the surplus income amongst the widows and orphans, and 15 guineas were presented to the secretary as a compliment for his exertions in collecting the subscriptions of the members. Five new members were elected.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

"MEDICAL PRESS" DEFENCE FUND.

The Honorary Treasurers beg to acknowledge with thanks the following contributions to this Fund, which they have received since the publication of the last list in our columns:—

	£	s.	d.
Dr. Clapton, London	1	1	0
Mr. Curling, F.R.S., London	1	1	0
Mr. A. B. R. Myers, Coldstream Guards	1	1	0
Dr. J. Langdon Down, London..	1	1	0
Mr. Critchett, London	1	1	0
Dr. G. M. Dickinson, Pailton, Rugby	0	10	6

Dr. Dolan, Halifax.—Many thanks.

Dr. L.—We are afraid such a communication would hardly be suitable for our columns were you to send it.

"When Doctors disagree, &c"—Blood-poisoning is becoming common in the Melbourne Hospital. Nothing else can be expected from over-crowding, bad ventilation, and defective drainage. The members of the hospital committee are too busy bickering with each other. They have no time to think of the welfare of the patients; it is therefore quite proper that they should die.—*Melbourne Medical Record.*

"FOURPENNY DOCTORING."

To the Editor of the Medical Press and Circular.

Sir,—I shall be glad if you will allow me to state in explanation of what appeared in your last.

I disposed of my interest in the dispensary practice of 72 Worship Street, London, in May, 1875, to Dr. George Fearon, of 42 Craven Hill Gardens, Hyde Park. He has no authority from me to issue or circulate any handbill bearing my name. It is a pity he should derive any benefit from a style of practice which he has not the courage to acknowledge. My only way of arresting this would be through the rascally bill of costs of some attorney. You can confirm the accuracy of my statement by a reference to the Medical Directories of 1876 and 1877.

If you will give me space I shall be glad to place all the arguments in favour of the dispensary system before the profession, and exhibit to them the only true bulwarks against the gratuitous prescriber, the prescribing chemists, and Government nostrum-vendors.

Yours faithfully,

P. V. Timothy, L.R.C.P. Lond.

The Countess of Ebersburg.—Her ladyship must pardon our declining to insert her article for the following reasons: We only accept editorials by our recognised writers. We have never seen the "Food" or its "valuable effects in consumption," and cannot, therefore, stamp with our editorial authority that about which we know nothing. The article is an excellently drawn advertisement for the maker of the Food, to whom we commend it for advertising purposes.

Clinical Society of London.—On Friday evening next, at 8.30 Mr. Callender, F.R.S., the newly-elected President, will deliver his inaugural address, after which, Mr. Brodhurst will bring forward a case "Cases of Subcutaneous Section of the Neck of the Thigh-bone."—Dr. Greenfield, a "Case of Hydatid of the Lung;" and Mr. Pugin Thornton, a "Case of Tracheotomy thrice performed."

Unqualified Assistants.—Referring to the letter which appeared in our last, a correspondent suggests the publication of the names or numbers of *unqualified assistants* in all the towns and villages of England and Wales in order to stop their employment by members of the profession, and for the better protection of the public. The idea is a good one, but the difficulty of carrying it out would be almost insurmountable.

Communications, Enclosures, &c., have been received from—Dr. McGregor, Weaverham. Mr. Anningham, Cambridge. Mr. J. Netten Radcliffe, Local Government Board. Dr. Greene, London. Dr. Balthazar Foster, Birmingham. Mr. John Gorham, Tunbridge. Mr. Gibbings, London. Dr. Winslow, London. Mr. Francis Vacher, Birkenhead. Mr. J. Wickham Barnes, London. Dr. Symonds, Ormskirk. Dr. Dolan, Halifax. Mr. W. Jones, Liverpool Royal Southern Hospital. Dr. Croft, London. Dr. Macnamara, Dublin. Mr. Hornibrook, London. Mr. Macilwam, Gloucester. The Registrar-General. Mr. Grooves, London. Dr. Winn, London. Mr. Lennox Browne, London. Dr. Ogle, Derby. Dr. Kerr, Preston. Dr. Kiernan, Cardiff. Dr. Lowder, Ryde. Dr. Duncan, Glasgow. Mr. Pritchard, London. Mr. Jabez Hogg, London. Dr. Caton, Liverpool. Mr. Croft, London. Mr. Thicke, Westminster. Dr. Cornelius Fox, Chelmsford. Mr. Evans, London. Dr. Woltenden, Burton-on-Trent. Mr. James Dunne, Dublin. Dr. Lionel Smith, Royton. Mr. George Brown, Hon. Sec. to the Medical Defence Association. Mr Timothy, Barrow-in-Furness. Dr. Lane, Isle of Man. Dr. Hoggan, London. Mr. Lubbuck, &c., &c.

VACANCIES.

APPOINTMENTS.

Gibbings, Ashley, M.R.C.S., L.D.S., Assistant Surgeon to the Dental Hospital of London.

Hutchinson, S. J., M.R.C.S., L.D.S., Assistant Surgeon to the Dental Hospital of London.

Marriages.

Dixon—Cooke.—On the 18th inst., at Holy Trinity Church, Eastbourne, E. L. Dixon, M.D., M.R.C.P., of Preston, to Elizabeth Anne, caughter of the late Swinhoe Cooke, of Liverpool.

Lloyd—Williams.—On the 18th inst., at Trinity Church, Rhyl, E. J. Lloyd, M.D., of Bangor, to Mary, widow of O. T. Williams, M.R.C.S.

Webb—Cottrell.—On the 17th inst., at the Cathedral, Sydney, Australia, Dr. E. R. Webb, eldest son of Dr. Webb, of Eccleston Square, London, to Catherine Eliza (Kate), eldest daughter of James Mashall Cottrell, Brixton, S.W. (by telegram).

Deaths.

Adams.—On Jan. 18, at 2 Vanbrugh Park Road West, Blackheath, John Adams, F.R.C.S., Consulting Surgeon to the London Hospital, aged 71.

Bellyse.—On Jan 11, at Audlem, Cheshire, Richard Baker Bellyse, M.R.C.S.E., aged 67

Butter.—On Jan. 13, at Plymouth, John Butter, M.D., aged 85.

Cawley.—On Jan. 4, at Brailes, Warwickshire, John Cawley, L.S.A.L. aged 81.

Clarke.—On Jan. 2, at Barwickstead, Cumberland, William Barwick Clarke, M.R.C.S.E., aged 65.

Davies.—On Jan. 12, Henry J. Davies, M.D., eldest surviving son of the late Rev. Henry Davies, of Regency Square, Brighton, formerly of Devonshire Place, London, aged 62.

Hulme.—On Nov. 28, at Dunedin, Otago, New Zealand, Edward Hulme, M.D.

Lawrie.—On Jan. 1, at Bradford, Yorkshire, John Douglas Laurie, M.R.C.S.E., aged 34.

ARMY MEDICAL DEPARTMENT.

18th January, 1877.

AN EXAMINATION of CANDIDATES for COMMISSIONS in the Medical Department of Her Majesty's Army will be held in London, on the 12th FEBRUARY, 1877 and the following days: -

1. Candidates having two qualifications—one to practise Medicine, and the other Surgery- under the Medical Act, and who are not under 21 nor above 32 years of age, at the date of the London Examination, are eligible to attend.
2. Those gentlemen who may be selected for appointment will receive £250 per annum, and allowances in addition, after passing the Examination at the Army Medical School at Netley.
3. The tenure of appointment will be limited to ten years, and on the completion of that period of commisioned service, surgeons, unless they be specially selected for further employment in the Department, will be entitled to receive, in lieu of all pension on retirement (pension for wounds excepted) the sum of £1.000.
4. Application for admission to the Examination should be made in writing, without delay, to "The Director-General of the Army Medical Department, London," by whom a printed schedule containing further particulars will be furnished.
5. There will be fifty appointments offered for competition.
6. The list will be finally closed on Saturday, 3rd February next.

Signed, W. M. MUIR, Director-General.

GENERAL NURSING INSTITUTE for TRAINED HOSPITAL NURSES.
5 Henrietta Street, Covent Garden, W.C.
A. EBSWORTH, F.R.C.S., Director.

THE STEWART INSTITUTION FOR IMBECILES, AND LUNATIC ASYLUM, LUCAN.

PATRON:—H.R.H THE PRINCE OF WALES.

This Institution was founded in 1869, and has already attained a large measure of success. It is situated in a healthy locality, and is under the superintendence of a Resident Physician, with trained teachers, who endeavour by the most improved methods to develop the powers, mental and physical, of Imbeciles.

To the pupils who can receive such instruction useful trades are taught. In that of mat making, particularly, excellent progress has been made, and an inspection of the work is invited either at the Institution or at the office

The Institution is the only one of its kind in Ireland, and is mainly supported by voluntary contributions.

Pupils are admitted free by election, or by payment of £40 per annum. A higher rate is payable for separate accommodation.

Contributions to the fund for the erection of the proposed extensive buildings at Palmerston are earnestly solicited.

Each donation of Five Guineas gives the donor a life-vote.

Annual Subscribers are entitled to one vote for each half guinea paid.

An Asylum for Lunatic Patients of the middle classes, under a well organised administration, also forms part of the establishment.

Full particulars as to the working of both Institutions, terms, &c. can be had at the office,

40 MOLESWORTH STREET, DUBLIN,
W. O'NEILL, Secretary

ACCIDENTS BY FLOOD AND FIELD.

ACCIDENTS OF ALL KINDS
May be provided against by a Policy of the

Railway Passengers' Assurance Company,

The Oldest and Largest Accidental Assurance Company.
HON. A. KINNAIRD, M.P., Chairman.
SUBSCRIBED CAPITAL, £1,000,000. ANNUAL INCOME, £205,000.
£1,120,000 have been paid as Compensation.

A fixed sum in case of Death by Accident, and a Weekly Allowance in the event of Injury, may be secured at moderate Premiums.
Bonus allowed to Insurers of five years' standing.
Apply to the Clerks at the Railway Stations, the Local Agents, or 64 CORNHILL, LONDON.
WILLIAM J. VIAN, Secretary.

IRISH CIVIL SERVICE PERMANENT BUILDING SOCIETY.

OFFICES—52, LOWER SACKVILLE STREET, DUBLIN.
PRESIDENT—ALEX. PARKER, ESQ., J.P.

Established 1848.

PROFESSIONAL AGENCY AND MEDICAL TRANSFER OFFICE.

50 LINCOLN'S INN FIELDS, W.C.

J. BAXTER LANGLEY, LL.D., M.R.C.S., F.L.S.,

&c. (KING'S COLL.), and Author of VIA MEDICA.

Has always upon his books a large number of desirable Investments and available Appointments for negociation.

The business of the Professional Agency is based upon the general principle, that no charge is made unless work has been done and services rendered.

No Commission charged to Purchasers.

Full information as to terms, &c., sent free on application.

Office hours, from 11 till 4; Saturdays excepted.

COMPETENT ASSISTANTS provided without expense to principals. No Gentlemen recommended whose antecedents have not been inquired into.

LOCUM TENENS.—Dr. Langley has now organised a thoroughly reliable Staff of suitable Gentlemen to take full Charge of any Practice which may require it in the absence of the principal, at fees from £2 12s. 6d. upwards, according to age, experience, qualifications, &c. One of these gentlemen can be despatched by an early train after receipt of telegram or letter stating duties and terms. Office fee 10s. 6d., payable by the principal.

PRACTICES AND PARTNERSHIPS NOW OPEN for Negociation (in addition to those advertised in Dr Langley's List, which is sent post free on application).

A 264. IRELAND. Safe Transferable PRACTICE, specially suited for a doubly-qualified Catholic gentleman. Receipts, upwards of £600 a year. Patients, good middle class. Midwifery fees, £1 1s. to £3 3s. Visits £1 1s. No bad debts. Residence contains 11 rooms with good stabling, &c. Rent, £36. Great scope for increase. A good introduction will be given.

A 263. LONDON SUBURBAN NUCLEUS. In a most Desirable Situation, a rapidly increasing Nucleus yielding about £250 a year. Ten roomed corner house in a main thoroughfare. Rent, £50. Illness the sole cause of retirement. Furniture taken as it stands.

A 262. First-Class COUNTRY PRACTICE, within 6 miles of London. Receipts, £680 a year. Appointments, upwyrds of £200. Six months' introduction desired. Large house, with gardens, stabling, land &c. Rent, £57. No opposition. Railway station within half a mile. Premium, £700.

A 261. SUBURBAN NUCLEUS, producing £300 a-year. The connection is believed to be wholly transferable. Premium, £200, including surgery, fixtures, and drugs.

A 260. WILTS. Unopposed FAMILY PRACTICE yielding £400 a year. Appointments, £200. District agriculture. Expenses low. Premium, 1 year's purchase, half down.

A 258. First-class Suburban Partnership. There is a Vacancy for a Gentleman, with high class qualification in a PRACTICE yielding £300 a year. A Six Share is offered for £1,000, with option of further purchase at the end of the 5th year. Midwifery fees £5 5s. to £10 10s. Patients very good class.

A 257. CASH PRACTICE yielding £1,000 a year. No bills. No midwifery or night work. Patients, middle class. The Practice is carried on in a rapidly increasing town in the North of England. Introduction, months. Present Incumbent is going abroad.

NOTICE—DR. LANGLEY'S LIST OF SELECT PRACTICES AND PARTNERSHIPS FOR JANUARY IS NOW READY. Sent Post free on application.

IRISH POOR-LAW INTELLIGENCE.

DUNGARVAN GUARDIANS.

THE WORKHOUSE MASTER'S AUTHORITY IN DISPOSING OF PATIENTS.

THE medical officer reported last board day that the master sent for treatment to the fever hospital a patient named Thomas Dee, suffering from gout, a non-infectious disease, thus imposing additional duty on the fever hospital nurse, whose duties were in her own department sufficiently laborious, and also subverting the use for which the fever hospital was built. The necessity for reporting the occurrence, he stated, was rendered more urgent by the fact that on the same day a case of fever was sent to the house hospital, producing, as may be imagined, a very considerable amount of inconvenience and dissatisfaction to the occupiers of the ward in which the patient was placed.

The report was referred to the master, who sent in the following explanation :—

The patient was thought to be suffering from rheumatic fever (to which he is known to be subject). At his own request and that of Dr. Anthony, who attended him, he was placed in a vacant ward in the fever hospital. There is only one child sick there at present, so that the hardships to the nurse, who has three able-bodied assistants, could not be very great in the case, and the one patient in another ward necessitated the doctor's visit to the hospital. In the second case a patient came to the workhouce and presented a ticket, which stated that he was to be admitted to the hospital, being suffering from rheumatism. He was admitted to the general hospital, where the doctor saw him on the following morning, and pronounced him in fever. The medical officer, however, instead of ordering his immediate removal to the fever hospital on the workhouse grounds, thought it right to leave the patient in the wrong hospital, and report the master (or rather the dispensary doctor) for not being infallible. As the greater number of patients come into the hospital after the hour of the doctor's daily visits, the master and other officers act according to the best of their judgment as to the disposal and treatment of such patients till the doctor's next visit. He has not found fault with with this arrangement before, though a mistake as to the nature of the disease may have occurred from time to time. If he is dissatisfied now, or if he holds the master responsible for the life and death of patients admitted in his absence, there is only one remedy—viz., to send for the medical officer without delay, as in any case I believe I am bound to do, and let himself or the proper authority give directions in each case.

Both report and explanation were referred to the Local Government Board for their opinion.

SANITARY ADMINISTRATORS FOR IRELAND.

GUARDIANS OF NUISANCES.

AT the meeting of the Gorey Guardians last week Mr. Palmer reported that he inspected a quantity of herrings on the premises of Mr. Redmond, and considering them unfit for food, reported same to the sanitary officer, Dr. Webb, who also inspected them, and certified in writing that the fish was unsound and unfit for human food. He then brought the case under the notice of J. S. Scott, Esq. J.P., who declined to make any order on it, as he considered the certificate not sufficient,

Mr. Redmond said that probably the owner would buy more herrings and mix them with these herrings and sell them.

The Clerk read the Sanitary Act, and said from the Act and circumstances of this case, the sanitary board was open to a prosecution if they would not order the destruction of the herrings.

Mr. Morris—We have no proof that they are exposed for sale.

Clerk—But they are unsound and unfit for human food, and if ever they are offered for sale the board could be prosecuted.

Mr. Wolahan—In this very house herrings two years' old were boiled up for the paupers.

Mr. Morris—If these things occurred five years ago there would be nothing about it.

A Voice—You had not the Sanitary Act five years ago.

Mr. Morris—*It is a great mistake you ever had the Sanitary Act. It is the greatest piece of nonsence that ever was imposed upon us (cries of hear, hear).*

Mr. Creighton—That Act is in force ten years.

Chairman—If Mr. Palmer allows these herrings to be removed we are liable to a prosecution.

INCREASE OF POOR-LAW SALARIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your issue of the 20th December, 1876, and 17th January, 1877, I read with pleasure two letters referring respectively, in pleasing terms, to my letter of December 13th, signed "One of the Ill-paid."

Both these letters appear to me to contain very valuable suggestions ; but do even the most sanguine of our dispirited brethren hope to reach the good goal intimated, within any reasonable space of time? Verily, if we pull together with *that* object, many of us will die of starvation in the attempt before it is attained.

Are we then to do nothing?

I am far from undervaluing the importance of even remote improvements in our condition, but I do believe that our present efforts should be directed towards getting an *immediate increase of salary.* We cannot change existing laws without much trouble and *delay*, nor can we get rid of our liability to unnecessary "calls" and other hardships, but we can reasonably demand, and we might fairly expect, such increase of salary as would enable us to meet our calls and discharge our duties.

I cannot believe but that the Local Government Board, if reasoned with by our representative body, would give a favourable hearing to any reasonable request on our behalf, and I think it would greatly strengthen the hands of that body if we would unanimously call on them to take this step.

An official circular from the Local Government Board requesting Guardians to grant a minimum salary (with perhaps few exceptions) of £150 a year, would in many cases be sufficient, and a "sealed order" would readily complete the process.

If we aim at this, and this, *at present*, we ought to

succeed, and I venture to recommend that the matter be organised and tested without delay.

I am, Sir, yours truly,

"ONE OF THE ILL-PAID, AGAIN."

EXTRACTS FROM REGISTRARS' NOTES

For the Last Quarter.

BANBRIDGE; *Tanderagee.*—Fever had been very prevalent in this district during the previous quarter. There are a few cases of scarlatina in the neighbourhood at present. There are a considerable number of cases of whooping-cough about. The waters of the public pumps in Tanderagee have been lately analysed, and the majority of them have been pronounced bad.

BELFAST; *Castlereagh*, No. 1.—Whooping-cough was prevalent during early part of quarter. Some few cases of fever occurred in different localities.

COLERAINE; *Articlave.*—The sanitary condition of the district is vastly improved, all nuisances reporten to the sanitary board being removed immediately, and in many cases it is not necessary to make a report to the sanitary authority at all, as the offending parties are quite willing to remove the nuisance as soon as their attention is directed to it by the medical officer. The health of the district very satisfactory.

DOWNPATRICK; *Portaferry.*—I find that persons when "noticed" under the Sanitary Act to remove nuisances in the shape of manure heaps at their doorsteps, obey the letter of the law, but at the first opportunity renew the offensive collection.

KILKEEL; *Rostrevor.*—Out of the 14 deaths, 8 were caused by pulmonary consumption. Many cases of this disease seek in the sheltered village an alleviation of their symptoms. Thus the death rate is unduly loaded from this cause.

LURGAN; *Moira.*—The sanitary condition of the district is very good as far as relates to external nuisances; but the houses of the poor are still in such a wretched condition that, were it not for the mild weather, the death rate must be high. There has been no death registered from, and, as far as I am aware, no case of zymotic disease occurred within the last quarter in my district. Still there is want of power to enforce the necessary improvements to the dwellings: but we must hope that time will remedy this.

INISHOWN; *Malin.*—A child, aged 3 years, was burned or rather I should say roasted. It lived a few hours; there was no inquest or magisterial inquiry. A man went to fish in his usual health and was found dead on the weir; cause of death not known. No inquest or magisterial inquiry.

IRVINESTOWN; *Irvinestown*, No. 2.—Whooping-cough was extensively prevalent during the past two quarters; hardly a child in the district who had not formerly suffered from it escaped.

MILLFORD; *Rossgull.*—Fever very prevalent, but only one death caused by it. Diphtheria is again making its appearance, and, as usual, fatal almost in every instance.

OMAGH; *Dromore.*—The sanitary arrangements in the district are greatly improved under the recent Act, and it is now healthy and free from any epidemic disease, and the deaths registered during the quarter below the average.

SLIGO, *Carney*, No. 2.—The people comply with the sanitary laws in all cases. The district is perfectly free from any epidemic.

SLIGO; *Collooney.*—Sanitary state of district very bad. Not a single person has been prosecuted under the Sanitary Act.

SLIGO; *Riverstown.*—Scarlatina and fever (typhus very prevalent in this district. Sanitary condition of district improving rapidly.

(To be continued.)

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING JAN. 13, 1877.

Total registered deaths in Dublin and suburbs *		...	169
Ten years average of same week	... ...	...	190
Decrease of mortality below average	... ...	...	21
Ratio of deaths, suburb of Rathmines	...	19·5	per 1,000
" " " Donnybrook †		14·0	"
" " " Blackrock	...	14·4	"
" " " Kingstown	...	14·0	"
" " Entire Dublin district	...	27·9	"
COMPARATIVE RATIOS—London	... ...	20·1	"
" " Glasgow...	...	23·5	"
" " Edinburgh	...	21·4	"

* District extends over 10,050 acres, and contains 314,666 persons.

† This district includes City of Dublin and Incurable Hospitals.

The number of deaths from zymotic diseases registered during the week is 26; average number in the corresponding week of the previous ten years, 39·7. The deaths from these diseases registered last week include 1 from small-pox, 6 from fever, (1 typhus, 4 typhoid, and 1 simple continued fever), 8 from measles, 4 from icarlet fever, 1 each frem diphtheria, croup, erysipelas, diarrhœa, &c.

Five children died from convulsions.

Bronchitis caused 34 deaths, pneumonia 7, and lung diseases unspecified 2.

Eight deaths resulted from heart disease, 1 from aneurism, 4 from apoplexy, 3 each from cephalitis and brain disease unspecified, 2 each from paralysis and epileysy, 2 from jaundice, 5 from liver disease, 1 from nephritis, 2 from Bright's disease, and 3 from kidney disease unspecified.

Twenty persons died from phthisis, 3 from mesenteric disease, 2 from scrofula, and 4 from cancer.

Five accidental deaths were registered, viz., 3 from fractures and contusions, and 2 from drowning.

Eleven deaths from whooping-cough, 4 from measles, 3 each from fever and scarlatina, and 1 each from diphtheria and diarrhœa were registered in Belfast during the week.

Quarterly Return.

Births.—In the Dublin district, the ratio of births registered during the quarter was 26·4 in every 1,000 of the population.

The ratio of births in the city was 27·6 in every 1,000 of the population; and in the suburbs of Rathmines, Donnybrook, Blackrock, and Kingstown, only 22·2.

There was registered in London, during the same period, an annual birth rate of 36·6 in every 1,000; in Glasgow, 36·8 per 1,000; and in Edinburgh, 31·1 in every 1,000.

Deaths.—The number of deaths in the Dublin district during the quarter amounted to 1,759, affording an annual ratio of 22·4 in every 1,000 of the population; the average number in the fourth quarter of the previous ten years was 2,036. Omitting the deaths (55) of persons admitted into public institutions from localities outside the district, the rate for last quarter was 21·7 per 1,000.

The deaths north of the Liffey were 642, or 23·8 in every 1,000; south of the river, 732, or 21·3 in every 1,000 of the population. In the suburbs of Rathmines, Donnybrook, Blackrock, and Kingstown, 330, or 19·0 in every 1,000.

The number of deaths registered in London during the same period was 18,799, or 21·5 in every 1,000; in Glasgow, 23·1 in every 1,000; and in Edinburgh, 18·2.

Diseases. Dublin Registration District.—The deaths from zymotics were 345, or 19·6 per cent. of the total deaths, and equal to an annual rate of 4·4 in every 1,000. Those during the corresponding quarter of 1875 were 426.

Diarrhœa proved fatal in 48 instances: in the corre-

sponding quarter of 1875 the deaths from this disease numbered 83.

Fever caused 94 deaths (20 typhus, 59 typhoid, and 15 simple continued fever); scarlatina was fatal in 46 instances; measles in 39; croup in 19; whooping cough in 26, against 76 in the corresponding quarter of the previous year.

Erysipelas was the cause of 10 deaths.

Eight deaths resulted from small-pox; there was one death from this disease registered during the previous quarter.

Convulsions proved fatal in 131 instances, or 7·4 per cent. of the total deaths registered: in the fourth quarter of the previous year 151 deaths were ascribed to convulsions.

Bronchitis caused 253 deaths, or 14·4 per cent. of the total deaths registered—in the corresponding quarter of the previous year 335 deaths were ascribed to this disease; pneumonia caused 43 deaths; pleurisy, 7; astnma, 2; inflammation of the windpipe, 1; and lung disease unspecified. 26.

Twenty-six deaths were ascribed to apoplexy; 32 to paralysis; 12 to cephalitis; 5 to epilepsy; and 40 to brain disease unspecified.

To diseases of the liver were ascribed 31 deaths, including 2 from hepatitis, and 1 from jaundice; 8 deaths were ascribed to gastritis; 8 to enteritis; 5 to peritonitis; 2 to ascites; 5 to hernia; 3 to ileus; 1 each to intussusception and stricture of intestines, and 10 to stomach disease unspecified; disease of the spleen caused 2 deaths.

Bright's disease proved fatal in 10 instances; inflammation of the kidneys, diabetes, and cystitis each in 1; and kidney disease unspecified in 27.

Phthisis was the cause of 188 deaths, or 10·7 per cent. of the total deaths; cancer of 46; hydrocephalus of 27; scrofula of 15; mesenteric disease of 14; dropsy of 11; gout and mortification of 3 each; and noma of 2.

Fifty-three accidental deaths, 2 cases of manslaughter, and 2 of suicide, were registered.

Provincial Towns.—The following zymotic diseases proved fatal in Belfast during the quarter:—Whooping-cough in 57 instances, diarrhœa in 45, fever in 39, scarlatina in 33, measles in 7, and diphtheria in 3. There were 31 violent deaths. The annual rate of mortality afforded by the deaths registered in Belfast during the quarter was 23 per 1,000 inhabitants.

In Cork 16 deaths were caused by diarrhœa, 8 by fever, 3 by scarlatina, and 2 each by measles, diphtheria, and whooping-cough. The total deaths registered amounted to 519, representing an annual rate of mortality of 23 per 1,000.

There were 9 deaths from scarlatina, 10 from diarrhœa, 7 from fever, and 2 from whooping-cough registered in Limerick during the quarter. The annual death-rate represented by the number of deaths registered was 21 per 1,000.

In Londonderry the death-rate represented by the *registered* deaths was only 14 per 1,000; in Waterford the rate was 19; in Galway, 17; and in Sligo, 17. With the exception of 8 deaths from fever in Waterford, the deaths from zymotic diseases in those towns were few.

TWENTY-FIFTH REPORT ON THE DISTRICT, CRIMINAL, & PRIVATE LUNATIC ASYLUMS.

Abstract—continued.

At Cork the hospitals and adjoining airing courts authorised by Order in Council, July, 1873, were completed at a cost of £5,776; while the raising of portion of the boundary wall and means for securing a perfect water supply, were authorised in our report, at an estimated expense of £1,600.

At the Carlow asylum farm-offices were completed and structural alterations and repairs in part of the old asylum in progress, under an Order in Council, at a probable cost of £2,000, making a total expenditure on the institution at large of about £23,000 since the new buildings were commenced in 1873.

At Clonmel, the formation of a connecting tunnelled passage between the two asylums, separated by a public road, and improvements connected with the laundries and out-offices were authorised by an Order in Council, at an estimated cost of £1,995.

At Ennis sheds for patients and farm purposes have been completed, at a cost of £364 7s. 6d.

At Killarney fresh provision for 100 patients, with new dining hall, under an Order in Council, was commenced, on plans prepared by our own architect, the estimated cost being £10,000.

The detached hospitals at Letterkenny have been finished, the outlay being £4,955 5s. 9d.

At Limerick additional accommodation for 100 patients, with refectories and improved day-rooms, in the old structure, as planned by the architect of the Commissioners, were commenced—on contract for £14,500.

The abandonment of the present asylum at Londonderry many years ago had been recommended by the inspectors to the Executive, and constantly urged by them on the local board. At the last summer assizes the governor and grand jurors ofthe district finally, and all but unanimously, acceded to the proposition, with the sanction of his Gracet he Lord Lieutenant. The selection of a suitable site remains in abeyance, the citizens of Derry being anxious to have it near the town, while the great majority of the landed proprietors wish it in a more central position, and one of easier access for the benefit of the county at large.

The provision in the new asylum being intended for at least 320 patients, the cost of erection, furniture, &c., with the purchase of land, will probably amount to £48,000, less the value of the existing structure, and the highly desirable ground for building purposes, eighteen acres belonging to it, worth perhaps a third of the sum named. The progress of the city seaward, or in its most useful direction, has been hitherto barred by the institution, so a double benefit will accrue from the projected arrangements.

Plans have been prepared for enlarging and improving the laundries and kitchens at Maryboro', by the board's architect, at an estimated outlay of £2,000.

The late purchase of land has not been as yet enclosed, the govenors still objecting to incur the expense of erecting a suitable boundary wall along the public roads at either side, the necessity of which is obvious.

In the Mullingar Asylum two commodious dining-halls have been in process of erection, under an Order in Council of the 30th June, 1875, on an outlay of £2,000. The inspectors regard such adjuncts essential to the well-organised institution for the insane.

At the Richmond certain unfinished portions of the boundary walls were completed, and alterations in the lavatories with a view to a continuous supply of water undertaken, at an expense, under Privy Council order, of £800.

Increased provision for 100 beds with other necessary works was authorised by Order in Council, on the 22nd October, at the Sligo Asylum, the estimated outlay being £14,000. The plans, prepared by the architect to the govenors, were minutely examined by the Commissioners and in part modified.

The same order extended to the purchase of forty-eight acres of land valued at £4,580.

At Waterford also additional accommodation for 100 patients with some alterations in the principal buildings, according to plans drawn out and submitted by the architect of the Commissioners, was ratified by an Order in Council, 6th November, 1875, the proposed estimate of which was £14,000.

Private Asylums.

There has been but little variation between the respective number of patients in private asylums during the past and the year preceding it. At the close of 1874 an

aggregate of 672, between both sexes, was under treatment. In 1875, 186 were admitted, making a total of 858 under treatment during the year, of which 165 were discharged; one female escaped, and 39 died. There consequently remained on the 1st January 653 of both sexes.

The recoveries exceeded in the year under review those of the preceding one by five, while the mortality was less by three—both satisfactory results. It is also gratifying to us to report that no accident of a serious character occurred. On the management of these institutions generally we are enabled to report in satisfactory terms, the great majority of them being conducted with carefulness and a becoming attention to the well-being of their inmates. So much, however, depends on the cost of maintenance, and the means of families to meet it, that a perceptible difference cannot but exist in the interior organisation of private asylums, some of which are replete with domestic requirements for the higher and more opulent classes of society; while others, from lesser stipends, do not present a like appearance of comfort. To make amends as far as lies in our power for the difference, and particularly, too, as not unfrequently the friends of patients consider they have fulfilled their duty to afflicted relatives by placing them under a safe control, without taking further trouble in their regard, entails no inconsiderable amount of responsibility on the inspectors.

Our ordinary visits to private asylums are made quarterly, and at irregular periods, but under certain contingencies, and in furtherance of the provisions of the statute they are rendered much more frequent, so as thereby to secure not alone the liberty of the subject, but to guard against any irregular procedure either as to the admission or subsequent detention of the reputed insane, who possess unrestricted privileges to communicate with us by letter. It occasionally, but rarely occurs that a justifiable cause of complaint on investigation is brought before us for inquiry. In some few we have had much ground for hesitation in adjudicating on their merits, and when in the absence of actual delusions the causes of disease were what come under the designation of moral, or were distinctly referable to habits of dissipation or of an unsubdued indulgence in drink. An inspector in such instances can only exercise a fair discretion, and by temporary means as a warning, protect the individual from a repetition of his own culpabilities. Indeed it has happened on three or four occasions in the past year that persons themselves, feeling the impending chances of a return of insanity from drunkenness, and to escape an urgent tendency to it, have not only not objected to being placed under restraint, but voluntarily sought it; still, shortly after admission, threatened proceedings against the proprietors of private asylums for an illegal confinement. But of all the difficult cases to be dealt with, none so great as those of perverted minds, with a considerable amount of intellect, reasoning, and education, as found in the better classes, but whose acts, when free, offensive to others, and highly injurious to their own interest, are unrestrained by any sense of propriety or foresight. Discharged for a time, and comparrtively much improved, they frequently relapse, and for the most part with more discouraging symptoms.

Taking the large number of private patients in the licensed establishments of this country, we believe in no instance that has come under supervision since the date of our last report has an injustice been committed through an unduly prolonged detention.

Of the existing private asylums, four being on a charitable foundation continue exempt from the charge for licence, namely, Swift's or St. Patrick's hospital, the Friends' Retreat, similar to that in York, the Richmond Retreat for Ladies under the superintendence of a religious community of nuns, and the Lucan Spa institution. The residents in these on the 1st January, between male sand females, numbered 323. The new asylum for imbecile children, to be supported by voluntary contributions, and established through most liberal donations from Dr. Stewart, is in a very forward state towards completion, and in the coming spring will be fit for occupation. It is intended to accommodate 200 inmates, with all requisite appurtenances.

The site of the buildings themselves at Palmerstown, four miles from Dublin, in the centre of about forty acres of farm and pleasure grounds, is highly salubrious.

Pathological Anatomy of the Brain

LOCALISATION IN CEREBRAL DISEASE. (a)

By Prof. Charcot.

Chapter XIII.

Gentlemen,—You have not forgotten that the three great arteries of the brain take part in the formation of the arterial system of the central ganglionic masses, but the part they take is unequal.

(a) Thus: It is to the Sylvian artery that the predominance belongs. It supplies:—

1. The greater part of the nucleus caudatus.
2. The whole of the lenticular nucleus.
3. One portion of the thalamus opticus.
4. The whole extent of the internal capsule.

(b) The anterior cerebral plays a small part in this system. It supplies simply the head of the nucleus caudatus, and its division is not constant.

(c) The posterior cerebral plays a more important part, and is more definite. This artery, whose distribution is very extensive (since it sends branches to the choroid plexus, to the walls of the ventricles, &c.), supplies (as regards the central masses) the following parts.

1. The inner and posterior parts of the thalamus opticus.
2. The corpora quadrigemina.
3. The superior layer of the peduncle.

The diagrams that I am about to place before you (figs. 14 and 15), and on which the vascular territories are separated by dotted lines, will make the above details more intelligible to you.

(a) Translated from *Le Progrès Médical*.

Still, the description of the "striate arteries" needs to be more fully developed. When this is done, we shall be able to show you briefly that which it is essential to know concerning the central arteries, issuing either from the anterior or posterior cerebrals.

Emanating from the upper side of the Sylvian, the "striate arteries" pass through the foramina in the anterior perforated space, when they are soon lost to view.

But a very simple dissection enables us to follow them in the first part of their *intra*-cerebral course.

I call your special attention to the following description, because it is indispensable to a right understanding of important facts concerning common cerebral hæmorrhage.

This dissection consists in destroying successively the grey matter of the "insula," the white subjacent matter, the front wall, and last of all, the internal capsule. We thus lay bare the outer surface of the lenticular nucleus, in its whole extent. If the dissection has been carefully done, on a well injected brain (and this dissection is easy, because at any rate in the frontal portion the lenticular nucleus is (so to speak) naturally detached from the internal capsule), we may follow the first part of the distribution of the "striate arteries." We then see that they form a kind of fan on the surface of the grey nucleus; but at a short distance from the origin they bury themselves in the substance of the third segment and are lost to sight.

Now, gentlemen, we must follow the ultimate distribution of the striate arteries in transverse sections.

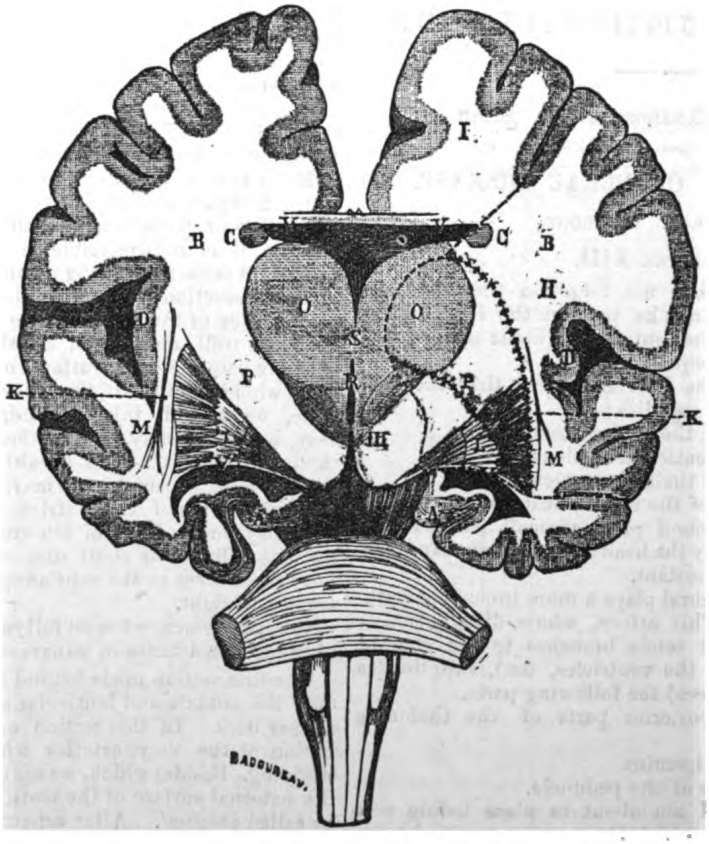
The first section made behind the commissure, shows us only the caudate and lenticular nuclei, the thalamus being farther back. In this section we find the deepest distribution of the very arteries which we have just been studying. Besides which, we see other smaller arterioles on the external surface of the lenticular nucleus, which may be called *internal*. After arising from the trunk of the Sylvian artery, they run almost vertically in the two first segments of the lenticular nucleus, and in the neighbouring parts of the internal capsule.

More interesting are the *external* striate arteries, which

FIG. 14.

Optic Commissure; B, Section of the Optic Band; L, Lenticular Nucleus of the Corpus Striatum; I, Internal case or foot of the radiating Corona of Reil; C, Caudate or Intra-ventricular Nucleus of the Corpus Striatum; E, the External Capsule; T, Taeniform Nucleus, front wall; R, Convolution of the Insula; V, V, Section of the Lateral Ventricles; P, P, Pillars of the Trigone; O, Gray substance of the Third Ventricle, which is continued behind the Optic Thalamus.—*Vascular Territories.* I, Anterior Cerebral Artery; II, Sylvian Artery; III, Posterior Cerebral Artery; I, Internal Carotid Artery; I, Sylvian Artery; 3, Anterior Cerebral Artery; 4, 4, External Arteries of the Corpus Striatum (Lenticulo-striate); 5, 5, Internal Arteries of the Corpus Striatum (Lenticular Arteries). The Lenticular Striatum Arteries are not represented here. (This figure is taken from a plate of Mons. Duret.)

FIG. 15.



Transverse Vertical Section of the Brain behind the Mamillary Tubercles and in front of the Peduncles.—S, Gray Commissure; O, O, Optic Thalami; U, Lateral Ventricle; U, Its Sphenoidal Cornu; P, P, Internal Capsule or Foot of the Peduncular Expansion; L, L, Lenticular Nucleus; K, External Capsule; M, M, Front Wall; R, Third Ventricle; A, Corner of Ammon; *Vascular Territories.* I, Anterior Cerebral Artery; II, Sylvian Artery; III, Posterior Cerebral Artery.

in the earlier part of their course run over the outer surface of the lenticular nucleus. They had better be divided into two groups: the first group is anterior, and includes the *lenticulo striate arteries;* the second and posterior group includes the *lenticulo optic arteries.*

One artery of the group is especially important because of its volume, and of the predominant part it takes in intra-cerebral hæmorrhage; one would be almost justified in giving it the name of "*the artery of cerebral hæmorrhage.*" After having passed the third segment, it passes through the upper part of the internal capsule, then reaches the substance of the caudate nucleus. It passes on then to the most anterior parts of this nucleus, tending from behind forwards. The distribution of this striate artery, of the lenticulo striate arteries should be studied on sections made in front of the last.

The *lenticulo optic* arteries are arranged on the same plan; only, after having passed through the most posterior part of the internal capsule, they reach the outer and anterior part of the thalamus, where they spread out.

I will remind you, gentleman, that we are concerned with *terminal arteries*, and that if the injections are pushed too far, little ruptures are produced at different points of the course of the vessels, thus imitating in seat and in formation the hæmorrhagic centres which are produced pathologically.

We have nothing special to say of the branches of the anterior cerebral, except to state that they are inconstant, and produce very circumscribed hæmorrhages, but of very great gravity because the rupture sometimes occurs in the ventricles.

The *posterior cerebral* will be studied here, only as regards its branches to the thalamus. These are of two kinds.

1. The *posterior internal optic* artery, which supplies the inner surface of the thalamus, and is capable in the latter part of its course of causing hæmorrhages; limited perhaps, but serious because they sometimes pass into the ventricles.

2. The *posterior external optic* artery, which traverses part of the cerebral peduncle, before entering the posterior part of the thalamus.

The ruptures of this vessel often lead to hæmorrhages into the substance of the cerebral peduncle.

THE COLD BATH IN TYPHUS ABDOMINALIS.(a)

Surgeon-Major Gore prefaced his remarks by alluding to the opinions of different military surgeons of the German army, strongly in favour of this mode of treatment, which (he said) was in general use in the garrison lazarettes. In Berlin, the cases were treated in a ward with open windows, the patients in winter being protected by screens from the direct effect of the cold air. The notes of the case of a soldier, treated in the Garrison Lazarette at Neuremberg, were given. His temperature on admission was 105·4° F. The first immersion reduced the temperature to 103°. Within two hours it had risen to 104°, and was again reduced by ten minutes' immersion to 101°; and so on during the progresss of the case, until the temperature ceased to exceed 102·5° F. This occurred a week subsequent to admission, during which the patient had been immersed in no less than twenty-nine baths. The chart of the case was exhibited, given to the author by Dr. Ullman, Oberstabsarzt.

(a) Abstract of a paper read before the Medical Society of the College of Physicians in Ireland.

Dr. Gore next alluded to the treatment of fever by cold effusion, as practised by Percival in the Richmond Hospital; when a temperature of 105° in the mouth was reduced to 98° by the direct cooling of the surface and withdrawal of its body heat, the excessive production of which led to the death of the greater number of those who succumbed to typhoid fever—death resulting from paralysis of the heart or paralysis of the brain, in such cases, without any special complication. Hæmorrhage from the bowels and perforation were contra-indications to the use of the bath, but not pneumonia or hypostatic troubles. Liebermeister's opinions were quoted, and his statement that "the entire appearance and bearing of the patients under the anti-pyretic treatment was such that the old picture of a typhoid fever-patient was no longer seen." The attendants did their part gladly, although the taking of temperature and giving of baths added immensely to their trouble, because the good results were so manifest, and because many of the annoyances of former times were, for the most part, done away with—such as involuntary evacuations on the part of the patient, violent delirium, bed sores, &c. Immediately after the bath the patient had rest, was wrapped up in a dry sheet, put to bed, lightly covered, and given a glass of wine. The temperature of the bath was 60° Fahrenheit, but in dealing with very feeble persons the bath might be gradually cooled down, beginning with a temperature of about 93°, and adding cold water gradually until the temperature was reduced to 72°, or below. Whenever the temperature reached 102·2°, a cold bath should be given: the duration of the effect of the bath was, to a certain degree, a measure of the obstinacy of the fever. In some instances a patient had taken 200 baths; but in the majority of instances, four to eight was sufficient. The use of antipyretic drugs (such as quinine, digitalis, &c.) obviated the necessity for the so frequent use of immersion. According to Liebermeister, where the antipyretic treatment of typhoid fever had been carried out with proper system it had yielded uncommonly good results, in the hospital at Basle reducing the mortality from 27·3 to 8·2 per cent.

Dr. Gore proceeded to review the more recent literature on the subject, referring to the experience of McCoombie, M. Sée (Professor of Clinical Medicine at the Hotel Dieu), Dr. Edeboel (of St. Francis Hospital, New York), &c., who gave only a qualified approval to the use of the bath. Experience at Homerton did not justify the belief that the cold bath would reduce the mortality from 20 to 3·5 per cent.; but it was considered there a valuable addition to the therapeutics of the disease and a valuable agent for mitigating the severity of the symptoms, and of retarding the rapidity of the morbid changes on which the symptoms depend—the remedy being only employed in severe cases. In New York, the bath was systematically used, when the patients possessed the "*average physical strength.*" If during the employment of the bath symptoms of great prostration supervened, the patient was immediately taken out of the water, rubbed dry, and warmly covered in bed. M. Sée, on the other hand, objected altogether to "systems" in the treatment of disease, condemned the bath as a useless remedy, and considered sponging with cold vinegar-and-water equally efficacious; quinine being according to him, the remedy, no agent (except alcohol) more effectually lowering the temperature of the body.

In conclusion, Dr. Gore compared the results of the ordinary mode of treatment in this country with the antipyretic treatment carried out in Germany and elsewhere, taking Liebermeister's figures as a basis of comparison. As a result of the comparison, he concluded that the ordinary treatment of enteric fever (as taught by the Dublin School of Medicine) yielded results which, in many instances, bore favourable comparison with those given by Continental physicians, giving statistics from several hospitals in proof of this opinion.

INFLUENCE OF ELECTRICITY ON THE LEAF OF DIONŒA—BEARING ON THE EXCITO-CONTRACTILE PROCESS IN ANIMALS. (a)

By J Burdon Sanderson, M.D., F.R.S., and F. J. Page, B.Sc.

Part I.—Mechanical Effects.

The mechanism by which the leaf of *Dionœa* closes after mechanical excitation has been already studied by Mr. Darwin and many other naturalists. It was, however, necessary in order to connect the electrical phenomena which form the principal subject of this paper, with this mechanism, to study the successive changes of form which the leaf undergoes in the act of closing. The investigations we have made relating to this subject have brought to our knowledge facts which have an imperial bearing on the general question of the nature of the excito-contractile process in plants and animals.

The smooth green outer surface of the leaf is concave, and the marginal hairs are thrown back so that they are nearly in the same place with the lobe from the edge of which they spring. If one of the sensitive hairs of a leaf in this condition is carelessly touched the leaf usually closes. If, however, this is done with great care with the aid of a camel-hair pencil, it can be predicted with certainty that no visible effect will be produced; and a similar gentle contact may be repeated several times before the leaf begins to answer to the irritation by any movement. Sooner or later, however, the marginal hairs bend inwards, and if the leaf is carefully watched it will be seen that each touch is followed by a slight approach of the lobes to each other. If the observation is continued, it is seen that each approach exceeds its predecessor in extent, until at last the lobes suddenly come together in the manner which is by this time familiar to every one.

It being our primary purpose to determine the time which elapses between each several touch and the immediately resulting jerk-like approach, and to measure the extent of such approach, so as to learn how much it contributes to the final result, we made it our first business to devise some method of measurement by which we could verify the conclusions to which we had come from rough observation, namely, that each several excitation of the leaf is attended by some mechanical effect. With this view we constructed an instrument consisting of a hinged clamp by which the leaf is held, as between the thumb and forefinger. On the lower jaw of the clamp, the one corresponding to the thumb, which is made of glass, the midrib of the leaf rests by its under surface. The upper jaw consists of an arch of copper wire, of which the curvature corresponds to that of the margins of a lobe of the leaf. The two jaws meet each other in such a way that when they are brought together by the screw, the two ends of the arch are in apposition with the ends of the midrib close to its upper surface. Each end is pierced by a pin; the points of these pins are directed towards each other, so that together they serve as an axis of rotation for a second similar arch of which the curvature is made a little smaller than the other, so that it may be comprised within it. From the middle of the second arch a wire springs at right angles, to which a light glass lever is attached. By means of this lever it can be rotated outwards on its axis, and thus made to diverge from its fellow at any desired angle.

The instrument is used as follows:—A leaf having been placed in position, that is with its midrib resting on the glass support, the two arches are brought down by the screw until they all but touch the trough of the leaf at opposite ends. This done, the arches are made to diverge until both are in contact with the internal surface of each lobe close to its border. All that remains is to fix a graduated arc against the lever, to select a sensitive hair for excitation, carefully to touch it at regular intervals, and to record the movements of the lever. Each approach of the leaf is thus indicated in magnified proportion by the end of the lever.

From this experiment, which was repeated several times and always gave similar results, it was learnt—1. That the first half-dozen excitations were absolutely without mechanical effect. 2. That the first effectual excitation was followed by so slight a movement that if it had not been enlarged by the lever it would have been imperceptible; and (3) that after this each successive approach of the lobes exceeded its predecessor. At the twenty-seventh excitation the leaf closed. The time of interval between excitation and effects were obtained by the following method:—

The apparatus employed for this purpose consists of—1, a recording cylinder; 2, an electro-magnetic chronograph made for us in Paris by M. Verdin, the perfection of which we owe to the kindness of our friend Professor Marey; 3, signalling keys, of which one closes, the other opens, the signal circuit—that of a battery of two Daniells. The cylinder, of which the surface is blackened in the usual way, revolves with great regularity five times per minute, and has a circumference of half a meter, so that the rate of horizontal movement of its surface is two and a half meters per minute (4·166 centims. per second); consequently a hundredth of a second (0·4166 mill.) is readily measurable.

In the present experiment it was necessary that the touching of the sensitive hairs should be accomplished with great gentleness, care, and exactitude, and always in the same manner. The touch in each experiment was made by one observer at an expected signal from the other, the arrangement being that A should count aloud 1, 2, 3, 4, 5, that B should touch at the moment 5 is said, and that at the same moment A should close the signal circuit, having his eye on the lever, and being ready to break the circuit at the first perceptible movement. Considering that the periods to be measured were of several seconds' duration, the method was quite accurate enough for the purpose.

The time-measurements, as will be seen at a glance, stand in a remarkable relation to the mechanical effects, showing that the delay between excitation and effect diminishes as the extent of the effect increases, both facts having the same meaning, namely, that in the plant, as in certain cases well known to the animal physiologist, inadequate excitations when repeated, exercise their influence by what has been termed summation, *i.e.*, that when any number of such stimulations, say *a*, *b*, *c*, *d*, *e*, &c., follow each other in succession, the effect of each is prepared for and aided by its predecessors. So that although, as in the present instance, *a*, *b*, *c*, *d*, may seem to produce no effect whatever, each of them really produces a change in the excited structure, and each contributes, when summed with its predecessors and successors, to the bringing about of the visible effect which follows *e*. During the remainder of the process the operation of the same law shows itself in the gradual augmentation of the increments, the last contraction, that by which the leaf closes, being the result of the summation of all the excitation which immediately preceded it, with all the previous excitations. Our conception of the nature of the process may be otherwise expressed by saying, that under the influence of successive excitations the latent excitability of the leaf gradually increases; for whereas before it either made no response, or postponed its response indefinitely, it now answers to the same stimulus by a visible motion of which the promptitude and the extent increase together.

In one of our experiments we arranged our apparatus in such a manner as to obtain a graphic record of the successive approaches of lobe to lobe by which closure is ushered in. It shows a fact which we had already ascertained by observation, namely, that in each approach the rate of motion augments rapidly at the beginning, and then very slowly subsides. It was for this reason that we allowed two minutes to elapse between each excitation and its successor; for if the interval were less, it began to act before the effect of the previous one had ceased. In the

(a) Read at the Royal Society.

experiments represented graphically the excitations were repeated every minute, so that the lever was still rising at the moment that each new ascent commenced.

It appeared important to ascertain whether, after the leaf is closed, it still continues to make mechanical efforts. We had already observed that a leaf which is repeatedly excited after closure, seems to be clenched with greater and greater force, and we thought it probable that mechanical work would continue to be done by a leaf after closure if it had the opportunity. To test this, all that was necessary was to attach weights to our lever sufficient to keep the lobes expanded. The result of a single experiment was quite conclusive. Each time, without exception, that the leaf was excited the weight (one gramme at a distance of 14 centims.) was slightly lifted, the extent of movement of the lever varying from one to three degrees.

As regards the interval between excitation and the resulting movement, our observations show that it varies from 2½ seconds (the shortest observed after numerous excitations) to 10 seconds. The last estimate is, however, probably exaggerated; for in the early stages, when the motion is of extremely small extent, it is not possible to determine exactly when it commences. In the later stages this source of inaccuracy does not exist, so that we may confidently take two seconds as the inner limit of the period of delay.

Clinical Records.

DEATH THE RESULT OF OBSTETRICAL PROCEDURE.

Translated from *Le Paris Medical*, Jan. 18, 1877.

By T. W. Dolan, L.R.C.P.E.

To record only the triumphs of obstetric medicine is a more pleasant task than to mention its failures, but cases of *malpraxis* may serve as useful lessons, and act as beacon lights to warn accoucheurs of the mistakes that may happen. Comment on the following case is almost unnecessary as it points it own moral.

On Nov. 22nd, a primipara, æt. 41, after some slight pains during the day was suddenly seized by violent contractions, followed in a minute and a half by spontaneous rupture of the membranes.

On the 23rd, at 4 o'clock in the morning, a doctor was called in—who having allowed the labour to proceed without interference until three hours after mid-day, suddenly asked for the assistance of a *confrère* as the application of the forceps was necessary, the head of the child being much too large. About 6 p.m., two doctors had applied the *forceps more than ten times*. These operations, according to the statement of the patient, were very painful. *Attempts at version* were even tried, although the head was very much engaged. A third physician was then fetched, who tried in vain to apply the cephalotribe *without having perforated the cranium*.

At length, in despair, the woman was sent to hospital, after forty-four hours of acute pain, and after having undergone numerous and violent measures.

On the 24th, at 8 a.m., M. Depaul finds the woman warm, but with a weak, thready, frequent pulse (130); tongue dry, and skin burning. The abdomen was distended, the genitals œdematous, very much contused, and presenting large eschars visible in all parts. The child no longer moved; heart-beat no longer heard. By the touch a considerable sero-sanguineous boss was felt, the bones of the contused head overlapped one another, the base of the cranium appeared retained. After the examination, M. Depaul no longer hesitated to apply the cephalotribe in order to diminish the head of the dead child, and to fatigue the mother as little as possible, she being already so worn out. The woman was chloroformed, the skull was perforated and the cephalotribe applied—and M. Depaul extracted a child weighing 3,050 grains without the brain.

In the evening the woman complained of violent pains in the abdomen, and died the next day.

At the autopsy they found lesions of the peritoneum, and on the right of the posterior cul-de-sac of the vagina *a perforation the size of a 5-franc piece*, and in many other places contusions and eschars.

The pelvis measured 10 centimetres in the antero-posterior diameter of the brim, after the uterus and appendages were removed.

We do not regard this case as a typical instance of French practice, though the writer in *Le Paris Medical* adds this suggestive observation, "We do not understand why the knowledge of similar facts does not induce the professors of the Faculty of Medicine to demand to have their chairs 'quintupled.'"

Transactions of Societies.

PATHOLOGICAL SOCIETY OF LONDON.

At the meeting of this Society held on the 16th January, and after the opening address by Dr. Murchison, which was reported in our last issue, several of the members exhibited some interesting specimens of visceral syphilis.

Dr. Greenfield brought forward specimens of "Syphilitic Disease of the Dura Mater and Cerebral Arteries of the Brain and of the Lungs," and others illustrative of the growth and degeneration of gummata. The specimens were chiefly taken from a series of *post-mortems* on twenty-two cases of syphilis which he had made at St. Thomas's Hospital during the last three years. An analysis of these cases showed that of those who died from the direct effect of the disease, the majority were comparatively young. The causes of death in fifteen of these cases were of a syphilitic nature, viz., thrombosis of the cerebral arteries in five cases, thrombosis of the pulmonary artery in one, syphilitic disease of the larynx in two, lardaceous kidneys in three, gummata in the brain and dura mater in one, syphilitic stricture of the colon in one, hæmoptysis in slight phthisis one, and pyæmia one. Lardaceous degeneration of the viscera was absent in eighteen out of twenty-two cases, but in two cases it was extremely advanced in all the organs. In ten of the cases there were no marks of skin eruptions or ulceration, in four there were several cicatrices on the legs, and in eight the skin was not thoroughly examined. But it was remarked that there was not the slightest evidence of skin affections in those cases where the cerebral disease was most marked and extensive, and that where the skin was most affected, there was little syphilitic infiltration of the internal viscera, lardaceous degeneration being alone present. Marked changes in the skin were observed in connection with changes in the larynx, rectum, and lungs; and in several cases there was marked atheroma of the aorta. In one specimen of syphilitic disease of the cerebral arteries, a small artery in the pia mater near a gumma in the brain presented the appearance of a whitish fibrous cord, and a section of it showed that the walls of the vessel were so thickened as to leave only a narrow channel. The outer coat was infiltrated with a cellular growth, the inner coat was remarkably thickened, while the middle coat was but little affected. The growth in the inner coat was found on closer examination to resemble a fully-developed gummatous growth, with capillaries of new formation running through it. In another specimen the thickening seemed to involve all the coats, although the inner coat may have been mainly involved. With regard to gummata, whose high degree of organisation and sudden decadence are very remarkable, Dr. Greenfield thought that their degeneration was due to partial occlusion of the small arteries by proliferation of their endothelium. Two specimens of apparent syphilitic disease of the lungs were also

shown. In these cases there was a contraction and puckreing of the pleura over certain parts of the lungs, due to fibroid bands passing inwards from the pleura along the course of the vessels. Dr. Greenfield remarked that this condition was only observed twice in over six hundred *post-mortems*, and in both other evidence of syphilis existed.

Dr. GOWERS exhibited some interesting specimens :—1. Syphiloma of the Brain, which springing from the dura mater involved the pia mater, and invaded the brain tissue itself by several processes which branched out into the convolutions around the blood-vessels. He believed that all intra-cerebral gummata sprang from processes of the pia mater between the convolutions. The structural continuity of the peri-vascular sheaths of the pia mater was well known. 2. Two syphilitic nodules growing from the dura mater of congenital origin, consisting of very small rounded nucleated cells, along with fusiform cells and a delicate fibrillary stroma. 3. Syphilitic disease of cerebral arteries, in which the basilar artery was much thickened by a growth outside it, and a large gumma in the anterior lobe of the brain. The nodule shown was from the middle cerebral. The affected arteries were either much reduced in size or obliterated. The diseased structure consisted chiefly of small cells and a delicate fibrillar stroma which appeared to originate in the outer coat, but which in one part penetrated all the coats. 4. Syphilitic nodule of the lungs from a patient who had also two gummata in the cerebellum. The nodule consisted of a small round-celled growth, partly surrounding the vessels and infiltrating the walls of the air-cells which were the seat of inflammatory products. Histologically it was not possible to distinguish it from tubercle, but it resembled the growth described in the cerebral artery. Dr. Gowers said that histological examination alone could not decide the syphilitic or tubercular nature of a growth in the lung, and that the combination of growths and inflammatory products closely resembled that seen in tubercular phthisis.

Dr. BARLOW also showed specimens of Syphiltic Meningitis and Choroiditis, from an infant who had presented many marks of external syphilis in the skull, there were several spots of adhesion between the arachnoid and dura mater. The pia mater was thick and fibrous, with vessels which looked like thread. In the choroid were found collections of corpuscles in the chorio-capillaries, but which were neither situated around the blood-vessels nor in a degenerate state. In the pia mater there was an excess of fibrous tissue, with an infiltration of lymphoid cells and almost closure of the blood-vessels by a growth in their inner and middle coats.

CLINICAL SOCIETY OF LONDON.

FRIDAY, JANUARY 12TH, 1877.

Sir WM. JENNER, Bart., M.D., D.C.L., F.R.S., President, in the Chair.

CASES ILLUSTRATING THE TREATMENT OF RHEUMATIC FEVER AND SOME OTHER FEBRILE DISEASES BY SALICIN AND ITS CONGENERS.

Dr. HERMANN WEBER, after alluding to the rapid establishment of the reputation of these remedies in the treatment of rheumatic fever, to the remarkable and uniform success of salicin in the hands of Dr. Maclagan and many of his followers, and to a similar success of salicylic acid in the practice of Stricker, Broadbent, and others, and also to some failures of these remedies in the hands of several observers, gave the result of his experience as well in rheumatic fever as in some other febrile affections.

1. He reported fifteen cases of *rheumatic fever*, treated eight by salicin, four by salicylic acid, and three by salicylate of soda. As he had not observed any essential difference in the effects of the three remedies, he analysed the results of the fifteen cases together. In eight of them, mostly mild cases, the disease was checked within two to four days, without any unfavourable accidental effects of importance, by doses of 15 to 20 grains, at first given every hour, afterwards every two or three hours ; in one case the attack was rapidly overcome, but all the phenomena of serious collapse, accompanied with delirium, attended the complete defervescence, although only a comparatively moderate dose had been given, viz., 255 grains of salicin in thirty-four hours ; in one, of subacute type, three relapses occurred, by which, though each single outbreak was rapidly subdued by the remedy, the duration of the disease extended over five weeks ; in three others, the first attack was checked by the remedy, but the relapses which occurred had to be treated without salicin or its congeners on account of the vomiting produced by them ; in one case the remedy caused vomiting almost from the first, before it had exercised any influence on the disease, and another plan of treatment had to be adopted ; and in one case, finally, the disease rapidly increased in severity and became complicated with pericarditis, in spite of large doses of the remedy given in short intervals during five days.

2. Of *gonorrhœal rheumatism* there were four cases, attended with slight pyrexia (99 deg. to 101 deg. Fahr.) so treated. One was sick after every dose of either salicin, or salicylic acid, or salicylate of soda ; one took for two days 15 grains of salicin every two hours, then for three days 20 grains of salicylate of soda every two hours, without obtaining more benefit than rest alone produces in most cases ; the remedy had then to be discontinued on account of nausea and giddiness ; in a third case, the pain and swelling in the joints and the pyrexia were much relieved after two days of this treatment, while the swelling of the joints and the state of the urethra were not materially influenced ; in the fourth case, after three days' use of salicylate of soda, 20 grains every two hours, the pyrexia, pain, and swelling were much reduced, the state of the urethra remaining almost unchanged.

3. Two cases of *acute gout, i.e.*, gouty inflammation of the knees, feet, and hands, accompanied by pyrexia (99·5 deg. to 101·5 deg. Fahr.), were not materially benefited by either salicin or salicylate of soda.

4. *Typhoid fever :* four cases. In three of them, of average severity in young adults of good constitution, salicylate of soda, in doses of 40 grains three or four times a day, or 60 grains twice a day, exercised a distinctly antipyretic influence, causing diminution of temperature from 1 deg. to 2½ deg. Fahr., together with a slight reduction in the pulse-rate, and the same was the case when enemata containing 120 grains were given ; when sickness and prostration in two, and intolerable nausea in the third case rendered the discontinuation of the remedy necessary, the pyrexia again increased. The duration of the whole disease was probably not materially influenced, but the drowsiness, the tendency to diarrhœa, and the dryness of the tongue were diminished while the patients were under the influence of the remedy, and nourishment was taken more readily. In the fourth, and fatal case, the symptoms were excessively grave from the beginning (stupor and vomiting), and salicylate of soda was given only on a few days, with the effect of diminishing the temperature, but neither the pulse-rate nor the grave nervous symptoms.

5. In two cases of *ague*, one of the tertian and one of the quotidian type, neither salicin in 30-grain doses three times a day, nor salicylate of soda in 60-grain doses three times a day had any curative effect.

6. In two cases of *hectic fever* in consumptive patients, two 30-grain doses of salicin given in the forenoon had several times the effect of diminishing the intensity of the evening pyrexia, but in one of the cases the remedy had to be discontinued on account of the prostration produced by it ; in the other, it seemed to lose its effect.

7. In a case of *chronic pneumonis* of the lower part of the right lung, a single 90-grain dose of salicylate of soda administered on several mornings reduced the evening pyrexia very considerably.

8. In a case of acute *cyanche tonsillaris* (quinsy), 30-grain doses of salicylate of soda were given every three hours, from the evening of the second day, followed by defervescence towards the evening of the third ; but as this complaint occasionally terminates on the third day without medicine, no inference can be drawn from a single case.

9. *Scarlet* fever in a boy aged 12, was treated from the first day of its manifestation (by sore throat and pyrexia) with 20-grain doses of salicylate of soda every two hours ; on the second day the pyrexia was diminished, and, on the fifth day there was complete apyrexia, followed by a satisfactory recovery.

10. In a case of *polyarthritis scarlatinosa* (scarlet fever rheu-

matism), the joint affection manifested itself on the seventh day from the beginning of scarlet fever symptoms, and was entirely checked within less than three days by twenty-grain doses of salicylate of soda every two hours; but here again the experience of isolated cases does not justify sanguine inferences.

In comparing his own experience with that of others, Dr. H. Weber arrived at the following inferences—1. That salicin and its congener are powerful *antipyretics*, equal to quinine, with the exception of the effects of the latter on ague, against which they are comparatively powerless. 2. That they are of more general value in the treatment of *rheumatic fever* than any remedies hitherto tried, although they are not applicable in all cases, and thus not always able to prevent complications. 3. That their antipyretic influence may be usefully employed in other febrile diseases, such as typhoid fever, in combination with other modes of treatment, such as alcohol and bathing. 4. That their use is occasionally attended with accidental symptoms, some of these being unimportant, as noise in the ears, various degrees of deafness, giddiness, nausea, abundant perspiration, and possibly a cutaneous eruption; while others are graver, such as vomiting after every dose, delirium, and collapse, pointing to the necessity of caution and watchfulness, especially in states of weakness of the heart and exhaustion. 5. That there is no essential difference in the action of the three remedies mentioned; but that salicylate of soda, being more soluble and more easily absorbed, exercises a more rapid effect, but requires to be given in somewhat larger doses than either salicin or salicylic acid; that amongst the two latter salicin possesses in so far the preference, as the taste is less disagreeable, and as it is more soluble than salicylic acid, which in its undissolved condition seems to be able to give rise to local irritation of the mucous membrane of the fauces and stomach.

A CASE OF ACUTE RHEUMATISM TREATED BY SALICYLATE OF SODA; INTERCURRENT SCARLATINA AND PECULIAR SKIN ERUPTION.

Dr. CAVAFY read notes of this case. A footman, æt. 33, was admitted into St. George's Hospital on June 1st with rheumatism of four days' duration. He was anæmic and nearly all his joints were painful. The knees and right wrist were red swollen. Heart normal. The temperature reached 103·8 deg. on the evening of June 2nd, on which day he was given half a drachm of salicylate of soda every two hours, beginning at 6 p.m. This was reduced to every four hours next day, as he complained of giddiness. Pain was much relieved, and the temperature fell to 101 deg. On the 5th he was quite free from pain, and the temperature was normal. He continued well till the 7th, when he had shivering sickness and headache, with slight sore-throat. The throat was worse next day, the soft palate, uvula, and tonsils being of a brilliant red. On this day also, he had a bright scarlet rash on the neck and chest. He complained also of great itching of the arms and legs, which were seen to be covered with raised red patches varying in size and shape. He was now given perchloride of iron. The erythematous patches became covered with a copious crop of vesicles resembling herpes, which soon dried up. The rheumatic pains reappeared on the 9th, and, on the 14th, were as severe as on admission, and the temperature to 102·6 deg. The sore-throat, rash, and itching having now subsided, he was again ordered salicylate of soda as before. This again lowered the temperature and removed the pain; but, on the 16th, the erythematous eruption reappeared, with great itching; the patches again became covered with vesicles, but much more scantily than before. Notwithstanding this and also some nausea, the salicylate was persisted in, and, on June 19th, the eruption had almost disappeared and there was general desquamation, more especially of the hands. The urine was free from albumen. As he was again free from rheumatism, he now took gentian and magnesia instead of the salicylate; but the temperature gradually rose again, and, on the 23rd, he had a sharp relapse. The salicylate was resumed, and again the temperature fell and the pains left him in three days. On this occasion he again complained of itching of the skin, but no eruption whatever appeared. He continued well till July 13th, when another relapse was treated in the same way, without any skin-eruption. He was discharged well on August 1st, the heart being normal. The case illustrated the antipyretic and anti-rheumatic action of salicylic acid and its salts, but was hardly favourable, as relapses occurred so frequently. It was a question whether these were due to the intercurrence of scarlatina; but the fever had probably no share in their production, as rheumatism was the initial illness, and relapses of equal severity sometimes occurred in ordinary rheumatism. The curious herpatic eruption was plainly caused by the salicylate of soda. This was certainly not a frequent toxic effect of its internal administration, but seemed to be not uncommon after external application of the acid, as shown by the cases communicated to the Society last year by Mr. Callender. A gradual tolerance of the drug seemed to have been established in the case under consideration, as the second eruption was not so severe as the first, and the third and fourth administrations were not followed by any eruption at all.

Dr. JULIUS POLLOCK said that he had successfully used salicylate of soda in about twelve cases of rheumatism. In one case only did it fail in controlling the temperature, while in the other cases the symptoms were much diminished in from two to four days. He did not think large doses were required, fifteen grains every two or three hours being in his opinion sufficient. Most of his cases were sub-acute; but in one severe case with pericarditis rapid improvement took place under the drug. In one obstinate case twenty grains of the salicylate of soda three times a day gave relief in two or three days. He believed that this medicine will be found to be as useful in the treatment of rheumatism as iodide of potassium in the treatment of syphilis.—On the other hand, Dr. ALTHAUS believed that the remedy did much harm in some cases. In one instance, a case of pemphigus was produced all over the body along with aphthæ in the mouth and fauces, and hæmorrhage from the bowels.—Dr. WHIPHAM spoke favourably of the drug, and said that cases of acute rheumatism sent from St. George's Hospital to the Atkinson Morley Hospital nearly always relapsed until the introduction of salicin.—Dr. ROGERS had given these preparations in nine or ten cases with very satisfactory results, and in one dose, a seventh attack, the cure was very rapid.—Dr. SUTRO thought that when the temperature was high the salicylate of soda was preferable to the acid; and with regard to the former, it should be borne in mind that soda itself was an anti-rheumatic agent.—Dr. BROADBENT had given salicylic acid and salicylate of soda in about twenty cases with very satisfactory results. For the first day or two he administered twenty grains every hour for six hours; but in one case he had to discontinue the remedy on account of giddiness and delirium taking place. If, moreover, pericarditis set in before commencing the treatment, the salcylate of soda neither gave relief nor controlled the temperature. It appeared to be of most use in well marked cases of acute rheumatism.—Dr. DUFFIN related a case in which the salicin treatment failed to lower the temperature, although it relieved the pain and the affections of the joints.—Mr. GEORGE BROWN doubted whether this new remedy was more successful than alkalies given in large doses.—Sir W. JENNER cited a case of severe burn, in which the local application of salicylic acid produced a general eruption resembling that of scarlet fever, and he thought the cases now related were of value in showing that eruptions do occur under its use. He had a most favourable opinion of the remedy, and said that while formerly he had failed to find a cure for rheumatism, and had given drugs more out of deference to the opinions of others, his scepticism had been very much shaken since he had given salicin and the salicylates. He thought that at any rate a case had been made out for salicylic acid and its compounds in favour of giving them a fair and impartial trial.

MEDICAL SOCIETY OF THE COLLEGE OF PHYSICIANS OF IRELAND.

THE Third Meeting of the Session was held on January 3rd, 1877,

Dr. HAYDEN, Vice-President, in the chair.

Surgeon-Major GORE (by permission of the Council) read a paper on

THE COLD BATH IN TYPHUS ABDOMINALIS,

which will be found on page 81.

The CHAIRMAN considered the paper one of the deepest interest. They were all aware that the mode of treatment of typhoid fever by cold or tepid immersion had not been very generally practised in Dublin. He confessed he was one of those who had a prejudice against it for many reasons: firstly, because in most cases of typhoid fever there was a chest complication of some kind, most generally bronchitic, and the mode of treatment for that complication that he had found most efficacious had been warmth to the surface. He should

dread, under such circumstances, even tepid immersion, quite irrespective of the exposure of the patient in the process of being immersed. He was not at all sure that if the treatment by cold baths be viewed in a philosophic spirit it would stand the test of inquiry. It was a treatment that doubtless led to at least an alleviation of the sufferings to the patient where the temperature ran up to 105° or 106°, but the question was whether it would tend to shorten the period of the duration of the disease or not, or in any degree tend to cure it. Repeated sponging of the face, neck, and hands with tepid vinegar and water would serve as a channel for the discharge of the caloric from the surface, without exposing the patient to the danger of a cold bath.

Dr. LYONS thought upon the enteric affection hung really the whole special interest of the history of typhoid fever. It did not appear to him that anything contained in Dr. Gore's paper tended to show that in the cold immersion they had found any means of materially checking, modifying, or in any way altering the progress of that very remarkable disease. He did not think the duration of the disease had been sufficiently touched upon in the paper. He had not practised cold immersion, but he had used the tepid effusion from the watering-pot, which was always grateful to the patients, which had a very remarkable effect in promoting artificial circulation, and which had, on the whole, a very beneficial effect. He did not think they had evidence before them to enable them to say that the adoption of the cold immersion would be anything like a safe practice to recommend generally. He thought himself that it was attended with serious danger, and they had nothing to show them that it had been used as the sole agent in the management of these cases.

Dr. GRIMSHAW had had some experience of the cold bath in enteric fever, but that experience was made small, for he believed the results to be so dangerous that he would not pursue it any farther. In every case in which he used the bath—only three or four—while the patients were in the bath their strength seemed to fail them so much that he had to remove them at once. He was happy to say, however, that he lost none of the patients. He had used the warm bath with satisfactory results in these cases, especially in the cases of children.

Dr. DOYLE had been in the habit of using local applications of cold—a napkin or towel—fitting exactly over the part affected, where the patient complained of tenderness in the abdomen, and over that a layer of flannel and a large binder tied round, and he found in these cases the patients complained very little of pain. There was no hæmorrhage or diarrhœa. In the two cases in which he applied the local application of cold the patients had not a relapse of the disease, and they were quite well in two months. In cases of pneumonia and pleuritis the same treatment acted remarkably well, and in no case did any unfavourable symptom happen. In scarlatina and affections of the throat he had also applied it successfully.

Dr. FITZPATRICK said the position of the patient's bed in most of the best of bedrooms was injurious to the treatment of fever cases. The bed was generally placed between the door and the fire-place, and he was confident that the neglect to prevent a draught on the patient was most harmful.

Dr. HAWTREY BENSON thought the question was whether the reduction of the temperature was occasioned by the use of the bath, or arose from the failure of heat consequent on the loss of vital functions.

Dr. KENDAL FRANKS drew attention to some interesting statistics compiled by Dr. Mayet relative to the treatment of enteric fever in the hospitals of Lyons by means of the cold bath from 1872-76. In 1872, 181 cases were treated on ordinary principles without the cold bath; the mortality was 26·51 per cent. In 1873, of 205 cases treated similarly, 26·34 per cent. terminated fatally. Of these cases 9 only were treated by the cold bath, which was now introduced for the first time, and these all had a favourable termination. In 1874 the treatment of Brand came into full operation; 712 cases were treated during a mild epidemic. The total death-rate was 11·23 per cent. Of all these, 279 were subjected to the cold bath treatment alone; they furnished 26 deaths, or a mortality of 9·31 per cent. Those cases which were not treated to the baths showed a mortality of 12·47 per cent. The cold bath was reserved exclusively for the more severe cases. During the following years the number of cases placed under the Brand treatment was greatly diminished, and though the results still show decidedly in favour of the cold bath, the difference is no longer so remarkable. This is partially due to the introduction of other and incomplete methods of reducing temperature, such as cold enemata, luke-warm baths, &c., in place of the cold bath. In 1875, of 163 cases of typhoid fever, the mortality was 18·45 per cent. Of these, only 34 were treated by Brand's method, and they were those alone in which threatening symptoms appeared; the mortality was 17·64 per cent. The milder cases, which were not subjected to this treatment, showed a death-rate of 18·65 per cent. During the nine earlier months of 1876, only 22 cases out of 104 were treated by the cold bath; they present a mortality of 18·18 per cent., whilst 18·29 per cent. of the remainder had a fatal issue. The limited number during this last epoch subjected to the Brand treatment does not afford a sufficient basis for comparison. From the foregoing numbers Dr. Mayet draws the following conclusions:—1st. The patients treated by the baths, though selected from among the more severely attacked, have invariably presented since the beginning of 1874 a death-rate inferior to that of cases otherwise treated; 2nd. The mortality among the typhoid patients in the hospitals of Lyons has been on the increase since the number of patients subjected to the cold bath treatment has been on the decrease.

Surgeon-Major GORE, in reply, said that the general impression in Germany was in favour of the cold bath, which was generally used, and seemed to be a system. Liebermaster considered that hæmorrhage from the bowels was less frequent with the bath than without it.

Dr. GRIMSHAW communicated to the Society some observations on the management of the bowels in enteric fever, and in the course of the discussion which followed,

The CHAIRMAN said that one of the greatest evils was the administration of purgatives in the early stages of the disease. He believed the mistake made in the administration of such medicines was the result of perfunctory practice. The habit was unfortunately too prevalent of treating constipation with purgatives and diarrhœa with astringents. He thought in most instances the object might be accomplished by unloading the lower bowel, and effecting the remainder by diet. There was one mode of treatment—blistering the ilio-cæcal region—which he had found of the greatest value. The astringent which he had found most useful in the treatment of these cases of diarrhœa was sulphurous acid—15 to 20 drops, with 5 drops of laudanum. One of the principal objects in the treatment of typhoid fever should be the regulation of the diet. Dr. Grimshaw had directed attention in his paper to the danger of administering solids too early in such cases; but as long as the temperature was above the normal standard, in his (Dr. Hayden's) opinion it was not safe to administer even a particle of solid food.

Dr. LYONS had seen in many cases the injurious consequences of the incautious administration of purgatives in the early stages of this disease. After alluding to the difficulty of diagnosis and prognosis in cases of this disease, the speaker gave it as his opinion, derived from the observation of a large number of cases, that diarrhœa was by no means a necessary part of the earlier history of enteric fever, and he had seen cases which had not been "spoiled," as it were, by the administration of purgatives go through a great part of the fever without any remarkable amount of diarrhœa at all. He had seen numerous cases in which there had been no diarrhœa; and he had seen cases in which the disease proved fatal without diarrhœa ever having been a symptom from the beginning to the end of the case. With regard to the use of purgative medicines, he would almost go to the length of saying that he thought, on the whole, less mischief would result from its adoption as a general rule—that purgatives should be tabooed in the treatment of enteric fever. Certainly purgatives by the mouth should not be given except after mature consideration and deliberation, and unless one was satisfied that something existed which demanded the administration of a purgative by the mouth, and in his experience that was one of the very rarest things likely to happen in a case of typhoid fever. He believed, in this class of cases, the use of enemata was to be most strongly recommended. For many years they had been in the habit of using the decoction of camomile flowers, about 20 ounces, with very frequently an ounce of turpentine mixed through it with the yolk of an egg. He had frequently been enabled to check diarrhœa by enemata. They should administer, neither in food or medicines, anything that was likely to injure the intestine. He did not agree with Dr. Grimshaw that the patient's bowels should be moved in the twenty-four hours in a case of typhoid fever. He (Dr. Lyons) would at most prefer that the bowels were

only opened three or four times during the whole illness after the preliminary diarrhœa had been got rid of. They had all met cases in which the administration of solid food had led to hæmorrhage of the bowels and a fatal result. He thought that with eggs, arrowroot, and farinaceous food of one kind or another, milk boiled and used with lime water—that that would be found quite sufficient to keep up the patient's condition, and in that manner he could be brought over the long period of the disease.

Dr. JAMES LITTLE agreed with Dr. Grimshaw that they should avoid interference either with purgatives or astringents, unless it was absolutely necessary. The cases in which it would be desirable to interfere with purgatives were certainly very rare ones. Unfortunately, his experience of typhoid fever that was now prevalent was that there was certainly a tendency to cerebro-spinal complication, and in cases in which the head was very much threatened he thought the purgatives were sometimes required.

Dr. GRIMSHAW said his opinion was that it was an advantage to the patient if his bowels were moved three or four times in the twenty-four hours; but he did not think they should be interfered with if they were not moved so often. He had sometimes used blisters for the purpose of controlling diarrhœa, but he had not a high opinion of their efficacy. He had used calomel with success, and also enemata for the relief of the lower bowel.

The Society then adjourned.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, JANUARY 31, 1877.

FOREIGN MEDICAL PRACTITIONERS IN FRANCE.

WE have just received from the President of the Medical Council an abstract of some interesting papers and other documents on the above subject, that have been forwarded to him from the Privy Council Office. A perusal of these abstracts shows that, in the editorial remarks we recently made on the regulations contemplated by the French Government in reference to the practice of medicine by English practitioners resident in France, they were not of so unwarrantable and so objectionable a nature as was first represented, although it is to be hoped that the French Government will be more disposed than they are at present to be influenced by the arguments and representations brought under their notice by Lord Lyons. On a previous occasion we observed that it was not unreasonable that the French authorities should require some test of the professional qualifications of foreign medical men who intended to practise in France, and as some provision or check against the practice of medicine by foreign adventurers, whose presence, great success, and large professional incomes might naturally create a certain amount of jealousy among the native practitioners. Accordingly, we are not surprised to find that in one of the French reports it is stated that the liberty which has been hitherto accorded to foreign medical practitioners in France, has led to many and grave abuses, and has been repeatedly complained of by the French doctors. It is stated that unqualified and incapable practitioners have assumed and borne the title of doctors; that even able physicians have come to live in France, not to cultivate science, but to "pour cultiver la clientèle ou, pour appeler les choses par leur nom, pour gagner de l'argent;" and that the new Bill protects sundry national interests, such as that of the higher medical studies, and, above all, "l'intérêt de nos médicins nationaux, a qui nous devons maintenir la pre-éminence qu'ils se sont justement acquise par des travaux perseverants et des épreuves multipliées et difficiles." At the same time the report says, it is no wish of the French Government to impose such a hardship upon foreign medical men of recognised standing, who wished to practise in France, as to make them go over the whole course of their studies anew, and therefore the new Bill provides that such men should be granted a dispensation from "scolarité," or the curriculum of studies pursued by the French students, and only be required to pass an examination before they are allowed to practise.

Under the fear, however, that the Bill would have, as represented by M. Waddington, the Minister of Public Instruction, the effect of "absolutely interdicting foreign medical men from practising in France," Lord Lyons was induced to draw the attention of the French Government to the illiberal character of the Bill and the alarm which the announcement of it had produced amongst English physicians and English invalids. To these representations the French Government seemed disposed to pay due attention, but they not unnaturally expressed a desire to be furnished with accurate information as to the actual law and custom with regard to allowing foreign medical men to practise in England. The required information was duly supplied by the President of the Medical Council, and we need scarcely say that this information showed the French Government that the English law on the subject was not a whit more liberal than that which has created so much alarm in this country. By the 15th section of our Medical Act of 1858 the persons mentioned in Schedule A to the Act are alone entitled to be registered, except foreigners practising in England before the passing of the Act, and those who "act as president, physician, or surgeon to any hospital for relief of foreigners in sickness, and who are engaged in no other practice." Nor can a more liberal construction be put upon the proposed amendments of the Medical Acts with respect to the liberty accorded to foreigners wishing to practise in England in one of those amendments which was after-

wards withdrawn, it was proposed that the foreign candidate should be "tested by examination" as to whether his diploma represents "the like degree of knowledge to that which is required for obtaining a license under this Act," and "that he should be more than 40 years of age, and should have practised medicine and surgery for not less than ten years out of the United Kingdom." Again, in a resolution adopted by the Medical Council so recently as last year, and in answer to a memorial from foreign graduates, the Council expressed their opinion that no qualifications should be entered in the "Register," "over the education and examination for which the Council cannot exercise the same supervision and control as they do under Sections xviii. and xx. of the Medical Act in regard to the qualifications granted by the British licensing bodies, mentioned in Schedule (A) to that Act."

Although, however, as the above will show, the alterations in the French law proposed by M. Roger Marvaise's Bill are not of a more illiberal nature than our own actual or proposed law on the subject, we readily allow that the respective working of these laws would be very different in the two countries, considering the large number of English residents in France, especially in the great health resorts of that country, and consequently the much greater demand for English practitioners abroad than there is for French practitioners in this country. We are, therefore, glad to see from the more recent communications between Lord Lyons and the Foreign Office that M. Marvaise's Bill is not likely to pass as it at present stands. The President of the Medical Council suggested to the French Government, through Lord Lyons, that the course of this Bill might, if possible, be arrested until a joint committee of foreign and English representatives can be convened to consider the matter. And in his despatch to the Foreign Office, dated Jan. 12, Lord Lyons states that he had called the attention of the French Government to this suggestion, and that he had for long been earnest in pressing upon the consideration of the Minister for Foreign Affairs and for Public Instruction objections to the illiberal restrictions contemplated by the Bill. In reference to these representations, the Duc Decazes has informed Lord Lyons that the Minister of Public Instruction has thought it inexpedient to resist the simple consideration of M. Marvaise's Bill, but that the Government had determined to offer a strenuous opposition to the Bill in its future stages. In all probability, therefore, we shall find that we have been more "frightened than hurt," and that after all, the decision arrived at by the French Government respecting foreigners practising in France will be marked by prudence and moderation.

THE CARE OF IDIOTS AND IMBECILES.

The impolicy, and we may say, injustice of relegating the afflicted classes of the community to the efforts of benevolent agencies is sinking deep into the minds of philanthropists, and we rejoice to know that the "Society for Organising Charitable Relief" has taken up the question in an earnest spirit. Some months ago this Society, it appears, appointed a committee from amongst its most influential members, to consider the neglected condition of idiots, imbeciles, and harmless lunatics, last week it presented its report, and which we are pleased to find in the main advocates the views that we threw out for adoption—as improved methods of education and training, classification, and separation, taking those capable of some improvement from those without any kind of capacity for instruction. Hitherto, the blind obstinacy of those in authority has incarcerated all these afflicted classes in huge asylums where scarcely any attempt has been made to ameliorate their sad condition. Benevolent societies some years since showed that a very large proportion of idiots and imbecile children were capable of education, and, if taken early in hand, could be made useful members of society. The time has now come for the fullest development of a system begun on a benevolent foundation, but which is now totally inadequate to meet the ever increasing numbers of those afflicted classes. It is estimated that there are upwards of 40,000 idiots, imbeciles, and harmless lunatics in England and Wales, and of these more than two-thirds, or about 32,000 are chargeable to the poor-rate. Of the remaining 16,000 and upwards, about one-fifth belongs to those classes just above the pauper. It will be seen, then, that nearly 36,000 have to be provided for. Earlswood Asylum, although it may be doing its best, can only yearly receive about 30 or 40 out of a 150 or 200 applicants, and it must be evident to the most benevolent that to subject the friends of the afflicted poor to a long and weary canvass, involving loss of time, neglect of home duties, and at the best, is an iniquitous course, neither benefiting the charity nor the candidate, while it gives encouragement to begging, and most cruelly and unnecessarily exposes domestic sorrows to the public gaze. It is, therefore, proposed to ask the Government to sanction an extension of the system of training and education adopted at Earlswood. The Metropolitan Asylums Board tried from the first classification, but nothing approaching to supervision and training of idiots and imbeciles has been attempted in our lunatic asylums, and upwards of ten thousand of these afflicted people are still scattered amongst the 600 union-houses of England, where nearly all the conditions required for their proper management are conspicuously absent. The Metropolitan Asylums Board has succeeded in separating children from adults, and many industrial occupations are carried on under proper regulations, while those giving no sign of improvement are very properly drafted off to proper asylums. It is now about to be urged on the Government, in accordance with this precedent, to remove all idiots, imbeciles, and harmless lunatics from workhouses and county lunatic asylums into separate asylums, and to train and educate the young of these classes, under the supervision of specially appointed and responsible governing bodies composed of magistrates, representatives of the guardians of the poor, and persons nominated by the Crown; and, further, to divide the country into districts, each sufficiently large to fill an asylum or school containing not more than 500 children, to defray the expenditure out of the public revenue, and to extend to these afflicted classes the privileges accorded by Act of Parliament to the blind and deaf-mute, viz., "that relief given to children should not be deemed to be parochial relief given to their parents."

It must be apparent that, while private establishments

offer every advantage to the better classes of society, and to persons belonging to the middle classes, the humbler classes are, as a rule, unable to pay the full cost of maintenance, and cannot decently appear before their boards of guardians to claim the benefit of the legal provision made for the destitute; for these it is proposed that institutions supported on the voluntary principle should, by the removal of objectionable restrictions, and a selection of the most deserving, be made available. This plan we hope to see carried out in its integrity.

ST. MARY'S HOSPITAL.

It has always been allowed that the hospital for the sick and maimed is the brightest and most useful ornament among the many charities which have long characterised the march of modern civilisation. And many a rich man, when disposing of the property that would be left after his death, has justly considered that he could offer no better gift to God or man, than a good legacy towards the support of one of these beneficent institutions. Nevertheless, this great blessing to the poor, and source of consolation to the rich—this bright spot in our social system—has, unfortunately, never been free from blemish. The congregation under one roof of a large number of patients, suffering from various forms of disease, has always rendered it a matter of great difficulty to keep the air of the different wards as pure as could be desired. To meet this difficulty, it is necessary that each ward should be as far as possible isolated from the rest of the hospital; that there should be a large floor and cubic space allowed for each person; that there should be a free circulation of air throughout the whole building; that the "air ought to be changed at the rate of 4,000 cubic feet per head per hour;" that each patient should be prevented, as far as possible, from breathing the air that has passed over the beds of other patients, and that all sinks, water-closets, and other sources of impurity should be removed entirely out of the wards. These, and other *desiderata* that might be mentioned, are by no means easy to realise, especially in hospitals that were built at a time when hygienic principles were not so much attended to in their construction as they are now, or in hospitals which are, as they often must be, placed in localities which abound in various sources of air contamination.

It is, therefore, all the more gratifying to find that one of our West-end hospitals has, through the unbounded liberality and foresight of its governors, been able to overcome most of the obstacles that have hitherto stood in the way of hospital ventilation; and if we compare the state of St. Mary's Hospital previous to the alterations with that which now exists, we have every reason to congratulate the authorities of that institution on the success which has crowned their efforts. Dr. F. De Chaumont, Professor of Anatomy, Army Medical School, and under whose superintendence and from whose designs the alterations have been carried out, found the hospital when he first inspected it in a very bad condition. In the wards the ventilation was bad and insufficient, the air actually supplied being unevenly distributed, and to a large extent wasted. This was shown by the large amount of carbonic acid and organic matter present, and by the character of the matter suspended in the air. In many cases, also, there was a current of air setting in from the closets, so that it was in part water-closet air that was supplied. In the "accident" ward there was a large screen which greatly interfered with the ventilation of the place, and in the vicinity of which a large excess of carbonic acid gas and organic matter was found, together with epithelium and even pus globules. The air of the great stair-case was remarkably impure. That of the ground floor contained 0·999 per 1,000 of carbonic acid, of the first floor 0·930, and of the second floor 1·091, thus giving a mean of 1·007 of carbonic acid Under one of the wards was the laundry, the steam of which found its way into the wards above. Moreover, the impurities that were found in the air of some of the wards were of a very remarkable and heterogeneous nature. The reports before us contain several careful illustrations of these impurities—illustrations which reveal a state of things that forcibly remind us of the magnified drop of impure water which used to be projected on the screen to juvenile audiences at the Polytechnic Institution. Among the floating particles examined under the microscope were—pus, scabies, larvæ, epithelium of mouth and skin, epidermis of hay, fragments of insects, and spores of fungi, all of which will be found beautifully pourtrayed in the plates which accompany these reports. This is enough in all conscience to account for the propagation of contagion, and it is only to be hoped that there is some flaw in the "germ theory" of disease, or otherwise the mischief that has been done by some of these floating particles must have been something incalculable.

If we turn now to the improvements that have been made, we find that the wards have been cleared of all irregularities of outline, that the closets, sculleries, &c., have been completely separated from them and placed in annexes connected with the wards by means of passages with cross ventilation communication between the wards and the lobbies or other rooms have nearly all been either closed or bricked up, while additional ventilation has been provided for by the introduction of Tobin's tubes, Shernigham valves, and more window place, as well as by the opening up of lobbies and passages which formerly ended in *culs-de-sac*. The out-patients' department has been remodelled and shut off from the rest of the building; and the "Accident" ward has been improved by the removal of the screen and the introduction of central ventilation tubes. The effect of these and other alterations have been to vastly improve the cheerfulness and salubrity of the wards, and to improve the air of the whole building. There is now no close smell on entering the wards, and the ventilation is perhaps better than that of any other hospital in London. Thus, to take one example, in the Victoria, or female medical ward, the mean of one night's observations indicated the extraordinary amount of 8,700 cubic feet of air per head per hour, and showed that the air was changed at the rate of forty-six times in the twenty-four hours. Besides, the good and practical results of all these alterations have been already in some measure put to he test. Since they were made, we believe that no case of pyæmia has occurred, although the usual sources of pyæmia have been—as they always must be—present, and

cases have been brought into the hospital suffering from that disease.

With regard to Tobin's tubes, it appears that they do not work so well as could be desired. There is a risk of the outgoing currents of air flowing over the patients as they rush to the tube, and it is difficult to keep up the temperature in the winter without closing some of them. Moreover, the ventilators are apt to get blocked up, and in one Dr. de Chaumont found a bundle of newspapers and an old flannel jacket.

On the whole, however, we may remark that although the ventilation of St. Mary's Hospital has not reached the theoretical standard of Dr. de Chaumont, it is more perfect than any that has been hitherto secured under similar circumstances, and perhaps it is not too much to say that through the labour, liberality, and thoughtfulness of the Governors of this hospital a new era will commence with regard to the ventilation of large public institutions. At all events, the authorities of St. Mary's deserve all praise for the great efforts they have made on behalf of the patients committed to their charge, and the munificent outlay they have incurred will give them fresh claims upon the generosity of the supporters of our great public charities.

Notes on Current Topics.

Verdicts by Guesswork.

We have frequently complained of the system under which medical men swear to, and coroners' juries give judgment upon, causes of death, without any evidence to guide them except a look at the body and a chat with the neighbours. A particularly objectionable instance of this proceeding is reported by the local papers to have occurred last week at the Limerick gaol, where an inquest was held upon a prisoner who had been admitted at half-past three in the afternoon and died on the night of the next day. It was suggested that he did not get sufficient nourishment, and it was admitted that he got no medicine. We cannot discover from the report any *post-mortem* was held, but the medical officer nevertheless is stated to have sworn that the man died "from failure of the action of the heart, or watery effusion on the brain, the result of alcoholism," and this although he does not state that he saw the man for ten hours before death, and at that time he was "free from physical disease, but his brain was weak." The jury, apparently with considerable reluctance, found a verdict "that deceased died either from weakened action of the heart or serous effusion on the brain."

We submit that an inquiry of this sort is a sham—and a pernicious sham. Possibly the cause of death may have been either of the conditions stated, but no one has any reason to know that it was, and the fact that the jury could not decide the question shows how much they needed proper evidence. If it be of vital importance to save the cost of a *post-mortem* examination in such a case, we suggest that the cost of the whole inquest may as well be saved at once. The Act might be amended so as to allow the coroner to settle the matter by tossing a shilling, with—of course—all the solemnities requisite to maintain the dignity of the Court of Inquest. The jury might be present to "see fair," and would, no doubt, in many instances, be more at home at such employment than in deciding anatomical difficulties. If our proposition be unacceptable, then, by all means, let us "bury our dead out of our sight," and say nothing about it, rather than make ourselves and our laws ridiculous by such proceedings as the Limerick gaol inquest.

The New "Ecole de Medicine."

The designs for the execution of the works at the new School of Medicine at Paris, which have been prepared in conformity with a law passed last August, have been completed, and will be at once submitted for approval to the Municipal Council, having been already passed by the Minister of Public Instruction, and Paris will soon have a medical school worthy of France.

The façades and court-yards with which English visitors are familiar are to be retained, but three new divisions are to be built, each opening on one of the three neighbouring streets. The execution of the works will occupy about four years, and the rebuilding will cost more than four and a-quarter millions of francs.

An Interesting Tree.

The *Jardin d'Acclimatation*, at Paris, has just received several specimens of one of the most interesting of the flora of Rio Nunez—the Teli. The tree is an almost unknown species, and produces one of the most violent of existing poisons, which has recently been tried with success in several cases of tetanus. The Teli grows from sixty to eighty feet high. Its wood is very hard and close, and is much sought after for the building of boats in consequence of its resistance to decay.

Its bark affords a violent poison. In important law suits amongst the aborigines of the country, and when the proof of the case by evidence fails, teli is administered as an infusion as an "ordeal" to both the parties to the cause. He who survives is declared innocent, but almost always both die. No antidote is known, but the natives combat its effects by means of the bark of the *boullé-beté*, a species of acacia which produces abundant vomiting.

Hydrophobic Cows.

The *Avenir des Landes* reports a fact which is very rare in the annals of veterinary surgery, and which has occurred at St. Columbie, in the canton of Hagetware, in Switzerland. Last October, several cows were bitten by a dog which was placed to guard them. The herd tied up the poor animal in its kennel, and shortly afterwards it died with complete paralysis of the lower extremities. On the 2nd of November three of the cows refused their food. An abundant viscous and adherent saliva flowed from their lips, and at the end of six days they died with well-defined paraplegia. During the course of the disease they made no attempt to bite, nor showed any symptom of madness, except that the presence of a dog excited them to an extraordinary degree. In two months eleven cows died or were killed. The incubation of the disease was 25 to 30 days in the first eight, and 56 days in the three latter.

Great Reductions! Further Bargains!

THE following handbill has been sent to us by a correspondent with his opinion thereon, which latter, for cogent reasons, we abstain from publishing. The get up and style of the placard irresistibly reminds one of drapers' windows when passing through the process of "selling off." The recommendation "Your Favourite Doctor for about One Penny a Week," in bold type, is exquisitely touching:—

No more trouble about Hospital Letters.

No more waiting among Out-Patients.

YOUR

FAVOURITE DOCTOR FOR ABOUT ONE PENNY A WEEK.

Medicine and Attendance, if necessary, at your own Home.

Whitechapel and St. George's-in-the-East MEDICAL CLUB.

Inhabitants may have Attendance and Medicine from either of the following Doctors:

Dr. LOANE, 1 Dock Street.
Dr. MAHONEY, 300 Commercial Road.
Dr. MORRISON, 57 Cannon Street Road.
Dr. SEQUEIRA, 34 Leman Street.
Dr. SWYER, 32 Brick Lane.
Dr. TAYNTON, 247 Commercial Road.

PAYMENTS.

For each person between 16 and 18 years of age.	5d.	a Month.
For each person over 18 years of age ...	6d.	do.
For a Man and his Wife	8d.	do.
For each child under 16, in a family where a parent or guardian is a member of this or a Benefit Club	4d.	do.

More than three Children in a family need not be paid for.

Apply at 194 COMMERCIAL ROAD,

On Tuesdays and Fridays from 8 *to* 9.30 *in the Evening.*

Staff Allowances and Regimental Quarters.

WHEN the War Office had made up their minds to accept the unification of the Army Medical Department, we would imagine staff quarters would have followed staff-allowances. As a matter of fact, we believe the last will not be obtained without a right to the former. If we are rightly informed, officers of the general staff, control and chaplain's department, are entitled to staff quarters; why not the doctors? To young officers just entering the service the matter may be a small one, but to the older and married officer it must make a very serious difference, we should think. Sooner or later such petty distinctions must cease under the pressure of the more advanced public opinion of the day, and the sooner Her Majesty's War Office accept the inevitable the better for all parties.

Infectious Diseases.

ON Friday last a deputation from the Society of Medical Officers of Health waited upon the Right Hon. G. Sclater-Booth, at the office of the Local Government Board, on the subject of epidemics and infectious diseases, and the difficulties experienced by medical officers of health in coping with such cases. Dr. Buchanan, President of the Society, explained that their object was to secure that means be established for limiting the spread of dangerous diseases. He complained that their work in this respect was much hampered by their not having knowledge of the existence of such diseases. It should be made a duty on the part of the occupier of a house, or the medical officer in charge of the case, to give information to the sanitary authority. Other members of the deputation having spoken, Mr. Sclater-Booth observed that all the suggestions made were present to the mind of the Government when the Public Health Act, 1875, was in preparation; they had omitted them, because they would have provoked opposition, discussion, and delay, which might have been fatal to the passing of that measure. Although public opinion was fast ripening in the direction of something more authoritative and vigorous in the way of interfering between the medical attendant and his patient, yet he was not at all of opinion that they could have pressed Parliament to go further than it then did. He believed the time would soon come when they would be able to introduce some improvements in the law with the general consent of the public. With regard to the wishes of the deputation respecting notice being sent in to the central authority of the existence of disease, he believed public opinion was tending that way. He felt sure, also, that the medical world were not neglectful of the duties imposed upon them of giving advice that would check the spread of disease. With regard to the question of medical relief to persons not paupers, he hoped to introduce some regulations upon the subject next session. He could not promise at that moment to take up the Public Health Act, but anything that could be done to secure publicity of infectious diseases undoubtedly would be done, and any suggestions that would improve the law in that respect would have his best attention.

We shall reserve our comments on the above till next week, as the very judicious answer of Mr. Sclater-Booth to the deputation is deserving of more consideration than can now be given to it.

Carbonic Acid Poisoning.

A MELANCHOLY case of carbonic acid poisoning has taken place near Coleraine. A man was engaged in sinking a well, and had worked by the light of a candle for several days. Just before leaving work in the evening he exploded a charge of dynamite, which dislodged a large part of the rock. Next morning he descended as usual, but without lighting the candle. It was immediately discovered that he was lying insensible at the bottom, and a man who was known to be experienced in such matters was sent for. He volunteered to descend; but no candle was sent down to test the presence of gas, and he refused any special protection. When he had been lowered a few yards he was heard to call out, and

at once the windlass was reversed for the purpose of bringing him up. He, however, seems to have lost sensibility before he reached the surface, for he let go his hold of the rope, and fell to the bottom. Then, and not until then, a candle was lowered, and found to be extinguished before it had been let down one-third of the depth. Bearing in mind that a man who had worked previously at the well had given up the job in consequence of the foul air, it is almost inconceivable that the parties concerned should have displayed such carelessness and ignorance. The coroner's jury found "no blame attachable to any person." Of course they did! Is blame ever attributable to any one by a coroner's jury under such circumstances?

Dublin University.

THE following resolutions were adopted by the Council at the meeting on Wednesday last:—

That the Council shall, on the 7th February, 1877, proceed to nominate to the vacant professorship of Zoology.

That the following resolution adopted by the board (and previously recommended at the meeting of Examiners in State Medicine) be agreed to:—"Candidates for State Medicine Diploma shall be allowed to present themselves for examination at any time after passing their M.B. and B.Ch. examinations, instead of waiting, as at present, for the standing of M.D."

That the following motion be referred to the Professors of the School of Physic, that they may report upon it:—"That the appointment of a special teacher of ophthalmic surgery in the School of Physic is desirable."

Stock Poisoning.

CONSIDERABLE alarm has been caused among agriculturists in the central districts of Scotland by the sudden illness and subsequent death of not a few animals of the farm, mostly cattle. Presently it was discovered that a new sort of cake had been obtained lately by those farmers whose stock had suffered, from an extensive manufacturing company in the vicinity of Edinburgh. The company had meantime ascertained that in the process of manufacture a quantity of the castor-oil bean had got introduced, and constituted the deleterious substance. The company communicated with several farmers whom they knew to have recently purchased this contaminated cake, but the warning, though in time in some cases, was late in others. It appears that the castor bean, when compressed for the purpose of obtaining oil, emits no poison, but some poisonous ingredients remain in the residue, and it was this that contaminated the cake referred to.

Our Dustbins.

LETTERS of complaint, says the *Telegraph* of last Saturday, respecting the difficulty in getting dust removed from dwelling-houses, reach us from most of the suburbs of London. A Kensington correspondent says it is a month since his dustbin was emptied, and that then the clearance was only effected after he had repeatedly written to the vestry on the subject. East, north, and south, as well as west, the grievance seems to be equally felt. Nor are the central districts altogether silent concerning the nuisance which is caused by want of regularity in the removal of dust and refuse of all kinds. The contractors' carts, it is said, are often to be seen in leading thoroughfares as late as half-past ten in the forenoon, and where they are seen they seldom fail to be also smelt. The use of disinfecting and deodorising agents does not appear to be habitual with the proprietors of shell-fish shops and eating-houses.

The above facts show how desirable it would be to abolish altogether the present system of allowing dust and all kinds of refuse to collect until they become both a nuisance and source of disease. While this system continues in operation it will be difficult to secure the attendance of the dust carts as frequently as the requirements of health and cleanliness demand, and it would be much better if we adopted the plan practised on the Continent, and had the dust and house refuse removed every day. Certainly, the adoption of this system would involve very little additional outlay on the part of our parish authorities, while the gain to the community would be immense.

Home for Incurables.

DR. ACLAND, of Oxford, writes to the *Times* of Saturday:—

"You would be doing a great service, with your usual kindness to the suffering, if you allow the following facts the great advantage of a place in your columns. A niece of the late Archdeacon Sandford has spent her all in building, near Oxford, a small hospital for incurables. It is furnished and ready for use. The lady herself is a faithful and good nurse. Nothing, therefore, is needed but that patients should enter. She cannot maintain them; but any whose friends can provide the cost of maintenance will find a bright home and devoted care. It is grievous that such a place should be unused. Miss Sandford will give detailed information in answer to applicants writing to the address at the head of this letter."

This is also deserving the attention of the profession, considering that professional men are so frequently asked by their patients whether they know of any institutions of this kind. Perhaps the necessity of a hospital for incurables is rather an opprobrium to us as medical men; but, nevertheless, the principle of their foundation is a very good one, and there are too few of them to admit of any of those in existence remaining unused for the want of publicity.

Aniline Hat-Linings.

IT would seem that that portion of humanity which enjoys the luxury of wearing clothes is imperilled at both extremities, by the tricks of competing tradesmen. Not long since we heard much of the risks of wearing pink stockings, which had been found to subject the owners to violent eruptions about the ankles and to involve serious inconveniences, if not actual dangers. It was then discovered that the *desagremen* of the dandy-socked gentry arose from the use of aniline in the pink dye. We now hear that the other end of our bodies corporate is threatened with the same infliction, from the same cause.

A shoemaker in Stettin had bought a felt hat from a well-known firm. Soon after wearing it, though the hat exerted no pressure, headache set in, with frontal swelling, followed by a pustular eruption. The eyes also became so inflamed that they closed, and the swelling began to spread to the lower part of the face. It was evident that these symptoms were due to the wearing of

the hat, and—the latter having been submitted to examination by a chemist—it was ascertained that the brown-leather lining was coloured with poisonous aniline.

Let us hope that aniline hat-linings will be made contraband, for an attack on our crania is a far more serious matter than on our toes; and henceforth it is only those whose lining is on the outside of their heads that will patronise the attractive decorations of Stettin.

Death from Eating Hemlock.

An inquest respecting the death of an Italian, who died at the Sailors' Home, Falmouth, was held last week. The deceased's comerades gave evidence, the former stating that he partook of what he believed were similar herbs to those that caused the death of the deceased, but he felt no ill effects, nor did the deceased show any alarming symptoms until two hours after he had eaten the herb, when they had arrived at Falmouth, having rowed there from St. Just.—Mr. Vigurs, surgeon, who waswith the deceased up to the time of his death, gave it as his opinion that he ate the leaves of hemlock, the symptoms being similar to those of hemlock poisoning, and other deaths having occurred in the locality through persons having eaten of that herb.—The jury returned a verdict of "Death from poisoning."

The appointment of Physician-Accoucheur to Her Royal and Imperial Highness the Duchess of Edinburgh has been officially gazetted.

The number of "plucked" candidates at the recent examinations at the Royal College of Surgeons of England was smaller than usual.

Dr. Handsel Griffiths, Lecturer on Chemistry at the Ledwich School of Medicine, has been elected Corresponding Member of the Pharmaceutical Society of St. Petersburgh.

Dr. Wm. Thornley Stoker, Professor of Anatomy in the Royal College of Surgeons in Ireland, has been appointed Medical Adviser to the English and Scottish Law Life Insurance Company in Dublin.

The Hunterian Oration will be delivered in the theatre of the Royal College of Surgeons of England by Sir James Paget, Bart., on Tuesday, the 13th of February, at 3 o'clock.

The soldier M'Connon, who about a month since, when intoxicated, killed a comrade with a kick, and was sentenced to death, has been respited. Both the medical and lay press took up his case warmly, and this act of clemency is probably due in some measure to their exertions.

Mr. Jardine Murray, F.R.C.S., who, for the last fifteen years has been on the honorary staff of surgeons to the Sussex Eye Infirmary, was unanimously elected Honorary Consulting Surgeon at the forty-fourth annual meeting of the charity last Thursday, cordial votes of thanks being at the same time accorded for his valuable services to the institution.

The next meeting of the Pharmaceutical Society of Great Britain will be held on Wednesday evening, February 7th, 1877, at eight o'clock. The following papers will be read:—

"On the Admixture of Veratrum with Valerian Root." By Professor Bentley.

"The Colouring matter of the Petals of Rosa Gallica." By Mr. Harold Senier.

A man, named Thomas Cave, living at Kensal Town, Hammersmith, was sent to prison, last Friday, for two months, for obstructing an order for the removal of two children suffering from small-pox to the hospital. The accused lived and slept with his wife and four children, in a kitchen; two of the children were down with the small-pox, and the parents continually passing in and out amongst the general public. The law has now taught him that it is stronger than his threat to knock any one down who attempted to touch his children.

On Saturday last, an immense number of persons accompanied a deputation from the East End of London to the Metropolitan Asylums Board in order to protest against the occupation of a large clothing factory in Dod Street, Limehouse, as a temporary small-pox convalescent hospital. The deputation was courteously received by the Asylums Board Managers, who, backed by the Local Government Board, adopted a resolution not to postpone the motion for a fortnight by 30 votes to 4, declaring that the emergency of the small-pox epidemic demanded that they should at once open the hospital for convalescent small-pox patients.

The Lectures at the College of Surgeons of England will begin on the 31st of January, when Professor Erasmus Wilson will commence a course of Six Lectures on "Dermatology." Professor Parker will deliver a course of Nine Lectures on "The Osteology of Birds," commencing on Friday, the 16th of February next. Professor Flower will then deliver a course of Nine Lectures "On the Comparative Anatomy of Man," commencing on Friday, the 9th of March next. And in June next, Professor R. B. Carter and Mr. B. T. Lowne will complete the lectures for the present year, the former by a course of Six Lectures, the subject of which will hereafter be advertised; and the latter by Three Lectures on "Teratology."

On Thursday last, an injunction was sought in the Court of Chancery by the well-known firm of Brand and Company, manufacturers of the "meat extracts," so much prescribed by the profession, to restrain a person of the name of Mason from selling invalid preparations similar to the pursuers, under the style of Mason and Brand, no person of the latter name being then in the defendant's firm. Sir R. Malins ruled that as the name of Brand had gained a reputation for the manufacture of certain articles, the use of such name by the defendant was a trick of trade, intended to deceive the public, and could not be allowed. An injunction was accordingly obtained.

THE ANTI-VIVISECTIONISTS AND THE HOSPITAL SUNDAY FUND.

WE published the week before last a letter from Dr. Rawdon Macnamara, in which he emphatically and indignantly repudiated the inference publicly drawn by one of the anti-vivisection party that vivisection was practised in the Dublin Hospitals. That letter evoked two letters from readers, of which we give extracts, who forwarded subscriptions of £2 2s. and 5s. to the Hospital Sunday Fund. We are precluded from giving the letters *in extenso* by the wish of the writers :—

I have to thank you very much for your letter this morning, and I can assure you it has given me a great deal of pleasure. I have been so painfully interested in the question of vivisection, and feel so strongly about it, that it is more comfort and pleasure to me than I can well express to find such a view taken of the subject by one so thoroughly well able to judge as yourself. The opinion you express is so exactly what I have always felt—that what is *absolutely* necessary we must submit to, but that everything that is *un*necessary (and worst of anything that is merely for demonstrating what is already known) should be most rigorously checked.

May I say that your letter in the *Irish Times* also gave me as much pleasure. I had always heard that vivisection is not practised in Dublin hospitals, but it was a great satisfaction to me to see it confirmed on such excellent authority.

I cannot forbear to add that I always *grieve* over the wrong-headed zeal and folly (for I can call it nothing else) of some of the anti-vivisectionist party, and they do not see how much harm they do, even to their own side, by such conduct. I could quite understand a movement such as the last turning many people (not so good and humane as *you* have proved yourself to be) entirely against anti-vivisection, simply from just indignation at the folly and mischief of some of its partisans.

Five shillings in stamps for the Dublin Hospital Sunday Fund from a lady in Scotland who has read Dr. Macnamara's admirable letter in the *Irish Times* the beginning of this month, and who rejoices most truly in his feelings about vivisection, and deeply regrets the misguided zeal of some of the anti-vivisection party.

Edinburgh, Thursday, January 22nd.

ETHER INHALATION.

IN the *British Medical Journal* of the 20th inst. we find a detailed description of a portable regulating ether-inhaler, by Mr. J. T. CLOVER, F.R.C.S.

The author says :—"The arrangement of the apparatus enables one to cause the patient to breathe directly into and out of a bag, or partly or entirely through a vessel containing liquid ether. . . . The plan of excluding fresh air until insensibility has been induced, and admitting it very sparingly afterwards, has now been extensively tried in various ways, and it is practically free from the danger of causing serious obstruction of the pulmonary circulation and over-distension of the right cavities of the heart."

Mr. Clover sets out the advantages of this inhaler to be that :—

"1. It has no valves.

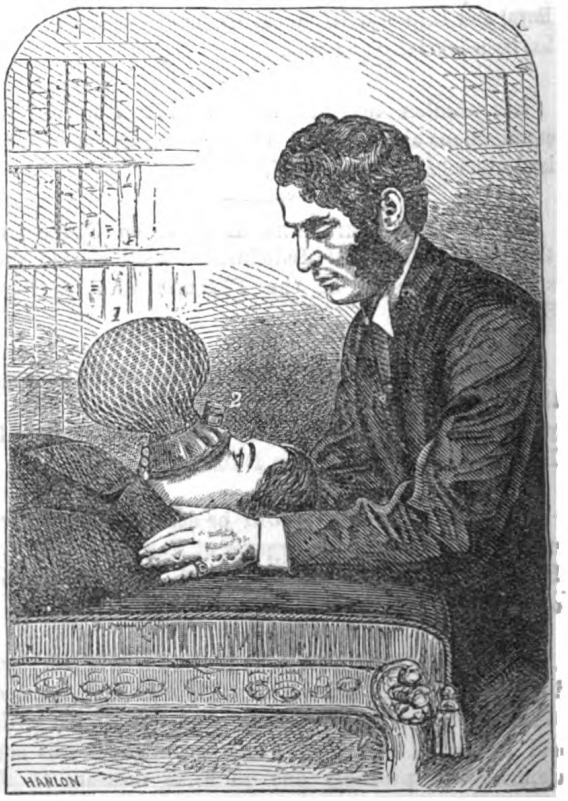
"2. It supplies the vapour so gradually that the patients breathe quietly.

"3. It produces sleep in two minutes." &c., &c.

We are glad to observe that, at length, the true principle of administration of ether—*i.e.*, the exclusion of air as completely as is possible—is recognised ; but we regret to notice that no credit is given by Mr. Clover to the first exponent of this principle, and that he seems to be unaware that the "exhalation bag" has been applied to an ether inhaler in anticipation of his own adaptation. To the late Dr. Morgan, Professor of Anatomy in the Irish College of Surgeons, the credit is due of having realised the fact that all the intoxication and other inconveniences arising from ether-inhalation are due to the admixture of a constant supply of air with the ether vapour—an object which all inventors of inhalers have striven to attain by adding elaborate ingress-valves to their apparatus. In order to exclude the air from admixture with the ether, Dr. Morgan used a thin india-rubber bag, sufficiently large to hold the expired air and to allow it to be returned to the lungs on inspiration ; and we are not aware that this principle was made use of in any inhaler until adopted by Mr. Ormsby (of Dublin), and now by Mr. Clover.

Mr. Clover can make himself acquainted with Professor Morgan's views by a reference to our files of four years ago, in which he will find recorded the introduction of the inhaler on this principle to the Surgical Society of Ireland, and the experiences of Irish surgeons thereupon. Should such a reference be inconvenient, Dr. Morgan's views, and the description of his inhaler, are to be had in pamphlet form. It was used very extensively in Dublin hospitals at that time, and only fell into disuse in consequence of the untimely death of the inventor, and the want of a successor to him in this speciality at the time.

Dr. Morgan's inhaler was, in principle, exactly the same as Mr. Clover's, but the exhalation-bag was enclosed in a tin box, which made the apparatus cumbersome and expensive. Adopting the same principle as Dr. Morgan, Mr. Ormsby (of the Meath Hospital, Dublin) has had in use for more than nine months an inhaler, with the bag attached to the mouthpiece exactly as Mr. Clover's is ; the only difference being that the ether-chamber of the latter is replaced by a sponge in the former. We append an illustration.



With this apparatus Mr. Ormsby has anæsthetised most of the cases in the Meath Hospital and in the Dublin Eye and Ear Infirmary for the last six months, and—as far as we have observed—with very satisfactory success. Mr. Ormsby's inhaler consists of a face-piece with exhalation-bag attached, exactly as in Mr. Clover's. It is supplied with an air-ring to fit hermetically the patient's face, and has no valve, but an orifice, which is opened for a moment at the commencement of inhalation to relieve the patient of the sudden inspiration

of undiluted ether vapour. The ether supply (which Mr. Clover places free in a reservoir) is sprinkled by Mr. Ormsby on a sponge, and we are not prepared to say whether the reservoir is or is not an improvement. Mr. Ormsby showed his inhaler, and anæsthetised a patient, within the last month at University College Hospital, in the presence of Mr. Christopher Heath and Mr. Mayer (of the firm of Mayer and Metzler), and the operation of the inhaler was in all respects satisfactory.

Believing that in as far as any fresh air is admitted, in so far will the anæsthesia be spoiled, we hold that the exhalation-bag should be of the full capacity of the tidal respiration, and if it be made smaller for the sake of portability, the working of the inhaler will be proportionately unsatisfactory. Probably all that Mr. Clover says in favour of his inhaler is true; but it seems hardly fair that the originator of its principle, and the adaptor of that principle, should be ignored, and the impression left on the mind of the profession that the instrument is the original invention of the gentleman whose name it bears.

Literature.

HANDBOOK OF PHYSIOLOGY. NINTH EDITION (a).

It is with very great pleasure we greet this the ninth edition of Kirke's "Handbook of Physiology." It is now nearly thirty years since the first edition of this work was published (September, 1848), and no better idea of the advances that have been made in the science of physiology can be obtained than by a comparison of that first edition and the present. In publishing his first edition, Dr. Kirke's primary and more especial object was to "give such an account of the facts and generally-admitted principles of physiology as the student may most advantageously use during his attendance upon lectures and in preparing for examinations." This object he most successfully fulfilled, and a want which was universally felt, both by teachers and students, was thus supplied.

From that time to the present "Kirke's" has been the almost universally used and favourite text-book on the subject in all our medical schools; for while its matter was limited to that actually required by the examining boards, its style was such as to make it both easy and attractive reading, without being discursive or prolix. As edition followed edition, additions were made here and portions omitted there, the work losing thereby much of its clearness and becoming somewhat disjointed and patchy, in parts being almost unintelligible to the ordinary student, who relied solely upon it for his guide. Moreover, physiology, and more especially histology, have made unprecedented advances during the last ten or fifteen years—advances which, however, have scarcely been fully recognised in this country for more than five or six; during which period several translations from leading German works and some works on higher physiology emanating from our own schools (such, more especially, as the "Handbook of the Physiological Laboratory"), have made us more familiar with the present extent and nature of physiological and histological research.

Meantime, the reputation of "Kirke's Physiology" began to decline. The eighth edition (1872) followed close upon the seventh (1869), of which it was almost a reprint, and this was published before the present physiological school was fairly established in this country. Of late years, therefore, both teachers and those taught began to feel that "Kirke's" was no longer sufficient for their purpose, that it required to be freely supplemented, and was, in fact, old-fashioned and out of date. Special instruction in histology was now required by the examining boards, and the histological part in Kirke's was worthless; experimental physiology was also demanded, and this portion of the subject could scarcely be found in it. A feeling was, therefore, rapidly gaining ground that a new handbook was required for students, and this want we are very glad to find supplied by Mr. Morrant Baker's ninth edition. From old acquaintance we have, perhaps, a prejudice in favour of Kirke's, and we should be sorry to see it supplanted; the book is familiar to us, and we value it as an old and well-tried friend.

Mr. Baker's task has been by no means an easy one, and we must congratulate him sincerely on the manner in which he has performed it. He has kept well in view the object aimed at by the author of the original work, he has followed it in a similar and thoroughly sympathetic spirit, and has attained a similar success. Mr. Baker has separated with great care the chaff from the wheat yielded by the recent physiological harvest, and that which he has retained may be safely received as good grain.

Perhaps the most important feature in this edition is the great improvement in the histological portion of the work, from which a student may now obtain all the leading facts in histology. In it he will find a good description of all the elementary tissues and organs, including the investigations of the most recent observers. In this part of the work Mr. Baker has been assisted by Mr. Schofield, who has done his work well and thoroughly. Many of the best and most valuable drawings from the works of Klein, Frey, W. Pye and others have been introduced with very great advantage.

But not only in this, but in many other sections has the book been much improved and brought well up to the knowledge of the present day. In many instances, more scientific and exact accounts of experiments have been given. Much that was unconnected and incomplete before—partly from the investigators themselves being uncertain or disagreeing as to their results—has been put in a more concise and lucid manner. This more methodical and definite arrangement of material, discussion of questions, and statement of facts, especially characterise the work that has been done in preparing this edition.

Among others, we may notice especially the following additions to the book. In the second chapter Mr. Baker has contributed an essay on "The Relation of Life to other Forces," originally published in the St. Bartholomew's Hospital Reports (1867). In this he has clearly indicated wherein "vital force" differs in its manifestations from other forces. While pointing out that the great characteristics of life are the series of events—birth, growth, development, decline, and death—all manifesting themselves successively in one being, he indicates that any one of these processes may be imitated by bodies not endowed with vitality, and that it is not the possession of any one of these characteristics, but only the union in one body of all, that entitles it to be considered as endowed with life.

The third chapter (which treats of the "Chemical Composition of the Human Body") has been entirely re-written, and made much more readable and interesting than the previous long list of hard names and chemical tests, which disgusted and appalled the student at the outset of his physiological studies. The proximate principles have been arranged in a more methodical and scientific manner, while one class (the "Amyloids") has been added which was previously entirely omitted.

It is, perhaps, in the fourth and fifth chapters, however, that the greatest improvement is visible in the work. These chapters, on the "Structural Composition of the Human Body" and of the "Elementary Tissues," have been expanded from thirty-six to fifty-seven pages, and contain no less than forty additional engravings. In

(a) Kirke's "Handbook of Physiology." Ninth Edition. By W. Morrant Baker, F.R.C.S. John Murray, Albemarle Street. 1876.

them the life-history and characteristics of the cell are narrated at some length. We recognise in it much of the work, and many of the plates, given by Dr. Klein in the "Handbook," both of which have been introduced with great advantage.

The chapter on the blood is another instance of the great amount of new material infused into the work; the section on the physical and chemical characters of the red blood-corpuscle, and that also of the white, being well given, and including all the recent observations on their behaviour with re-agents and varying physical conditions, such as temperature, dilution of surrounding media, &c.

Previous to the discussion of the circulation of the blood, a section on the discovery of the circulation is introduced, in which the great works of Harvey are referred to, and the main arguments by which he established the great fact enumerated; to this list the more recent ones bearing on the same point are added. This section is especially welcome, for we know of nothing in the history of physiology that would serve so well as a type of the method of induction of physiological theories from facts, or as a proof of the real value of vivisection and the great results obtainable by its aid. In this chapter, too, many of the new methods of physiological research are described, such as the cardiograph, Fick's spring kymograph, and the mercurial kymograph, and their uses explained. A section is devoted to the diapedesis of blood corpuscles, and the instruments of Ludwig and Chauveau for ascertaining the velocity of the blood-current are figured and explained.

In the chapter on respiration we miss an account of the recording stethometer, nor is there any reference to either Ludwig's or Pettenkofer's apparatus and methods for determining the amount of carbonic acid discharged into the air. Both of these omissions, we think, might be supplied with advantage.

The microscopic anatomy of the organs of digestion (as, indeed, that of all other organs) has received more attention, and its description been enriched by many new engravings. The glycogenic function of the liver is more fully discussed than heretofore, while more justice is done to the experiments of Pavy on this subject; the chemical properties of glycogen are described, and some of the causes of glycosuria enumerated.

Under "Absorption," the recent additions to the anatomy of the lymphatic cavities are described.

Chapter XVII., on "The Income and Expenditure of the Human Body," is a valuable addition to the book, and contains a few instructive tables illustrating the daily receipts and expenses of the organism, considered from a physiological point of view.

The great feature in the physiology of the nervous system is the short, but sufficient, account given of the convolutions of the cerebrum, illustrated by Ecker's diagrams; and the short epitome of the recent researches into the functions of the cerebrum, and some of the results of its electrical stimulation as given by Fritsch and Hitzig, and also by Ferrier; to which is added Dr. Burdon-Sanderson's strictures upon them, and an enumeration of those fundamental phenomena admitted by all observers. A section has also been added to this chapter, on sleep and its attendant phenomena.

In the chapter on the causes and phenomena of motion the results obtained by means of the myographion are shortly described, and a "muscle curve" explained, together with the method of measuring short intervals by ths vibrations of a tuning-fork.

The histology of the organs of the special senses is much more fully detailed, especially of that of sight. Those defects of vision so confusing to the student—myopia, hypermetropia, presbyopia, and astigmatism—are shortly and clearly explained, together with the physiology of the means used for their correction.

Lastly, the chapter on generation and development has obtained that thorough revision and increase which recent researches made necessary. It has also been further illustrated by many new plates, and an account is given of Dr. Creighton's researches on the evolution and involution of the mammary glands.

Some very useful tables have been appended to this edition, of measures and weights of organs and histological elements and tissues, together with the percentage composition of various articles of food, from which diet-tables, &c., may be calculated, and a table of classification of the animal kingdom.

Mr. Schofield has performed his part so well, and in a manner deserving of so much praise, that it is hard to find any fault; but we may venture to suggest that some of the engravings hardly do justice to what are evidently very beautiful microscopic preparations. As examples of this, we would especially draw his attention to Figs. 154 and 188; these and others we hope to see replaced in the next edition by some that will do his preparations more justice, and better bear comparison with those very excellent ones introduced from other works.

Although we have now many very excellent works on physiology, still there is none so admirably adapted to the wants of the ordinary student as Mr. Baker's new edition of Kirke's Handbook. In it he will find all that he requires, both intelligibly and concisely placed before him and most methodically arranged. The book has never professed to be a scientific or original work, but it is essentially a most excellent and complete text-book for students, and as such we most cordially commend it to them.

Medical News.

Royal College of Surgeons of England. — The following gentlemen were admitted Members of the College at meetings of the Court of Examiners on January the 22nd, 23rd, and 24th :—

Anderson, Alex. R., Plymouth.
Archer, William G., M.B., Edgbaston.
Armstrong, William, Manchester.
Barrow, Lancelot A., Camden Road.
Blaxland, Herbert, Ryde, New South Wales.
Brett, James, Leamington.
Clowes, Joseph S., Merrick Square.
Craddock, Frederick H., Finsbury Park.
Creed, Charles P., Greenwich.
Cross, Horace E. F., L.R.C.P., Craven Street.
Davey, William T., L.S.A., Leyton, Essex.
Davses, Richard, Birmingham.
Devenish, Wilhelm, Trinidad, West Indies.
Diggle, Charles F., L.S.A., Manchester.
Fletcher, Charles W. C., Leicester.
Frobisher, William M., Leeds.
Gillam, Thomas H., L.S.A., Weuverham.
Goulder, Frank S., L.R.C.P., Norwich.
Green, Alfred P., St. John's Wood.
Green, Alfred W., L.R.C.P., Guy's Hospital.
Hayward, Thomas E., Tewkesbury.
Hopgood, Wilfred F., Staleybridge.
Howlett, Edmund H., Stafford Gate.
James, Thomas, L.S.A., Aberdare, South Wales.
Law, Edward, Sheffield.
Kirkpatrick, John, M.D., Toronto.
Ling, Charles A. S., L.S.A., Gorleston, Suffolk.
Longstaff, George B., M.B., Wandsworth.
Looker, John E., Altrincham.
Macintire, John H, L., L.S.A., Richmond Road.
Malpas, Douglas D., Sevenoaks.
Mansell, Edward R., L.S.A., Upper Norwood.
Morgan, John, L.S.A., Strata Florida, South Wales.
Ogle, John R., L.R.C.P., Newport, Shropshire.
Rhodes, William, Birmingham.
Richards, Philip M., L.S.A., Fennant, Denbighshire.
Steele, Henry F., L.S.A., Stoke Ferry, Norfolk.
Stewart, Howard D., St. James's Gardens.
Stokes, Richard L., Redmarley.
Stone, Herbert S., M.B., New Brunswick.

Suscombe, William E., Porteus Road.
Tarrant, William O'C., Clapham.
Ward, William T., M.D., Stanhope, Canada.
Winterbottom, Arthur T., Manchester.

Vital Statistics.—From the Registrar-General's reports we learn that during last week 6,232 births and 3,598 deaths were registered in London and twenty-two other large towns of the United Kingdom. The natural increase of population was 2,634. The mortality from all causes was at the average rate of 26 deaths annually in every 1,000 persons living. The annual death-rate was 21 per 1,000 in Edinburgh, 22 in London, 33 in Dublin, and 28 in Glasgow. In the other large towns the rates were—Plymouth 16, Portsmouth 13, Nottingham 18, Sheffield 20, Bristol 20, Leicester 21, Norwich 14, Brighton 21, Sunderland 26, Birmingham 22, Leeds 21, Wolverhampton 26, Hull 20, Oldham 26, Manchester 28, Salford 30, Bradford 18, Liverpool 27, and Newcastle-upon-Tyne 26. The annual death-rate from the seven principal zymotic diseases averaged 2·9 per 1,000 in these towns, and ranged from 0·6 in Norwich, to 4·8 and 5·2 in Salford and Liverpool. The fatal cases of small-pox were 113, against 146 and 128 in the two preceding week; 79 in London, 21 in Liverpool, 2 in Manchester, 10 in Salford, one in Portsmouth, and not one in any of the other towns.

The Mortality of Foreign Cities.—The annual rates of mortality, according to the most recent weekly official returns, were:—In Calcutta 38, Bombay 33, Madras 49, Paris 27, Brussels 22, Amsterdam 24, Rotterdam 25, The Hague 24, Copenhagen 21, Stockholm 33, Christiania 24, Berlin 28, Hamburg 27, Breslau 30, Munich 34, Vienna 27, Buda-Pesth 39, Rome 28, Naples 36, Turin 23, New York 21, and Brooklyn 19 per 1,000 of the population.

Art in Hospitals.—A Committee is being formed for the purpose of raising a fund for the collection of works of art in pictures, sculpture, china, ornamental clocks, *bric-a-brac*, armour, &c., for the walls of our hospitals. As a commencement, Mr. Lawrence-Hamilton has offered 100 guineas, provided a thousand others will give an equal or larger amount. Whilst offering our sincere thanks for the kindly sympathy with our hospital patients evinced by this generous offer, we are nevertheless of opinion, that a hundred thousand guineas can be much better expended than by turning our hospitals into "curiosity shops," and putting temptation in the way of the needy. Pictures and inexpensive statuary will answer every purpose, whilst *bric-a-brac* and other extravagant articles of *vertu* should be consigned to more careful guardianship than that which is possible in our hospitals.

NOTES FROM OUR EXCHANGES.

Hydrate Chloral in Cancer of the Uterus.

Having first well washed out the vagina, by means of a speculum introduce a pellet of lint saturated with a solution of chloral one part to ten.

This should be repeated every two hours.

The pain after two or three applications becomes less, and the discharge less irritating.

Some Phenomena in Typhoid Fever.

MM. Millard, Martineau, Desnos, Laboulliene, Laveran, Gerni-Roye, have pointed out the following facts.

Typhoid fever patients die frequently from peritonitis even without perforation, and on its development the temperature lowers rapidly to 37° and 38°.

The patients succumb most frequently in two or three days, with a lowering of the temperature even to 36°.—*Soc. Méd des Hôp.*

A New Adhesive Plaster.

A mixture of twenty parts of mucilage and one part of glycerine constitutes an excellent shining and supple plaster, far cheaper than the resin and diachylon, and lasting more than a year without deterioration. Three or four layers of the mixture require to be spread over each other on the linen or other stuff, allowing sufficient intervals for the successive layers to dry.—(*Medical and Surgical Reporter.*)

On the Utility of Glycerine in Examination of Larynx.

M. Samondes has discovered the following fact which may be useful to the laryngoscopist. By placing some glycerine on the mirror the vapour contained in the expired air does not tarnish it.—*Le Paris Journal*, January, 1877.

NOTICES TO CORRESPONDENTS.

THE ANTI-VIVISECTIONISTS AND "THE MEDICAL PRESS."

The letter of Dr. George Hoggan, which was published in this journal last week, appears to demand some reply from the writer of the article of which he complains, especially as he has placed upon an expression in that article an interpretation which the writer cannot allow to be attached to it. Certain statements were put forward in an anti-vivisection handbill which were plainly calumnious of the medical profession; and though possibly true in an exceptional case, were the reverse when applied—as they are in the handbill—to medical men in general. Dr. Hoggan's name was made use of by the compilers of this pamphlet to advance their views, and it is part of his complaint against The Medical Press that the writer of the article, to use his own words, "connected my opinion in an unauthorised manner with certain exaggerations which I deplore perhaps more than you do." For the reference to him in the article to which he takes exception, Dr. Hoggan should, therefore, it would seem, complain of those who made him appear as a party consenting to the exaggerations of the anti-vivisectionists. If they have quoted him without warrant, and if he has permitted them to use his name for their purposes, it would not be our fault should we mistake him for one of themselves, and associate him with the antagonism to our profession, which is the leading point in their programme. Dr. Hoggan is quoted as having stated that "no student could be expected to come forward as a witness when he knows that he would be hooted, mobbed, and expelled from among his fellows by so doing; and any rising medical man would achieve professional ruin by a similar course." This is the only statement in the handbill of the Anti-vivisection Society which has reference to Dr. Hoggan, and the writer has referred to it as "untrue." We need hardly say that the writer's statement does not involve an accusation of deliberate or intentional falsehood, which we are far from attributing to Dr. Hoggan, but we submit the proposition is nevertheless, as applied to the profession at large, a mistaken opinion. If the hooting, mobbing, and expelling of a medical student from amongst his fellows for expressing an opinion or giving testimony against vivisection exists within Dr. Hoggan's circle, we can only plead narrowness of experience, and avow that we do not revolve within its orbit. The charge has been deliberately made both in Dublin and London by the Anti-vivisectionists that, in the medical profession, persecution would follow independence of opinion and speech in this matter. We object to this statement.

At the meeting of the British Medical Association for 1875, two most distinguished and respected members of the profession, Mr. Tufnell and the Reverend Professor Haughton not only spoke, but acted with vehe-

mence and energy against vivisection. Have they been "hooted, mobbed, and expelled from amongst their fellows?" Not at all. Their views may not be participated in, but their feelings are respected, and we can say as much on the part of the profession for the most rabid anti-vivisectionists.

Dr. Hoggan's letter does not convince the writer. He states that he was mobbed on three occasions when protecting and escorting lady students, and that a certain Mr. Childs was hooted when he lectured against vivisection. This is no proof that a student would be "hooted, mobbed, and expelled," if he were to testify against *abuses* of vivisection? We assert that the profession—students or practitioners—is, as a whole, incapable of such intolerance as the opinion expressed by Dr. Hoggan would indicate. We experience surprise in finding Dr. Hoggan, who shows that he can write with sense and moderation, linked in company, and without protest on his part with persons whose imagination is apparently in advance of their powers of expression, and he must acquit us if our discernment is unable to draw the line between their exaggerations and his views.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

"MEDICAL PRESS" DEFENCE FUND.

The Honorary Treasurers beg to acknowledge with thanks the following contributions to this Fund, which they have received since the publication of the last list in our columns:—

UNPROFESSIONAL CONDUCT.

In our issue of the 17th inst. we called attention to a report which had reached us as to the conduct of two Poor-law medical officers in Ireland who were alleged to have deliberately falsified their written promise in respect to appointments to which they have recently been appointed. The conduct of these practitioners—if the circumstances were truly reported to us—appears so disgraceful to themselves and dishonourable to the profession that we can hardly believe that the step they have taken was calmly weighed and considered by them; and we are led to hope that they will see that regard for their character as gentlemen and men of truth will induce them to retreat from the very discreditable position which they now occupy. We have before us copies of documents which we had intended to publish this week, but we refrain from doing so in the trust that those gentlemen will relieve us of the necessity of laying the cases before the profession for *their* judgment. We await an explanation before proceeding further.

Prof. Erasmus Wilson commences this week a series of lectures "On Dermatology" at the Royal College of Surgeons of London. To-day and Saturday the lectures will be delivered at 4 p.m. They are open to all members of the profession.

Harveian Society of London.—At the meeting on Thursday, Mr. Carr Jackson will introduce "Some Interesting Cases of Stone in the Bladder," and Dr. Fitzpatrick, "Cases of Abdominal Disease."

Dr. Greene.—Your surmise is correct; the individual who figures in the list referred to is the same.

Dr. R. J.—See the November numbers for 1876.

Mr. Wilson.—We do not give "advice to patients" in our columns; your local practitioner will be the best to advise you.

Royal Institution of Great Britain.—On Friday evening next, at 9 p.m., Prof. Osborne Reynolds will lecture "On Vortex Motion."

P. V. Timothy, L.R.C.P.—Your letter will appear in our next.

Royal Navy Service.—The examination of candidates for this branch of the service will be held at the University of London on the 12th proximo. Our advertisement columns will supply further particulars.

BOOKS, PAMPHLETS, AND MEDICAL JOURNALS RECEIVED.

A Text-book of Physiology. By M. Foster, M.D. London: Macmillan and Co.

On Rest and Pain. By John Hilton, F.R.S. 2nd Edition. Edited by W. H. A. Jacobson, F.R.C.S. London: Bell and Sons.

Ziemssen's Cyclopædia of the Practice of Medicine. Vol. VII. New York: Wood and Co.

Vivisection. By George Macilwam, F.R.C.S. London: Hatchards.

Bentley and Trimen's Medicinal Plants. Part XVI.

The Journal of Nervous and Mental Disease. Vols. I., II, III., IV. New York.

VACANCIES.

Westminster Hospital.—House Physician. Board and residence, no salary. Address the Secretary by the 1st proximo.

Birmingham Dispensary.—A Resident Surgeon. Salary commencing at £130, with £30 for cab-hire; furnished apartments but not board found. Address the Secretary.

Flintshire Dispensary.—House Surgeon. Salary, £100; must understand the Welsh language. Applications to the Hon. Sec., Holywell, Flints.

Wantage Union.—Medical Officer. Salary, £75, with extra fees. Applications to the Clerk of the Guardians, Wantage.

Glasgow Barony Parish.—Medical Officer for the Eastern District. Salary, £300. Applications to be endorsed "Medical," care of the Inspector, 38 Cochrane Street.

APPOINTMENTS.

Bolton, R., M.D., Medical Officer, Public Vaccinator, &c., for the Bangor Dispensary District of the Newtownards Union.

Cuthbert, W. W., M.R.C.S.E., Medical Officer for the Debenham District of the Bosmere and Claydon Union, Suffolk.

Dwyer, J. J., L.K.Q.C.P.I. & L.M., L.R.C.S.I., Assistant Medical Officer to the Richmond District Lunatic Asylum, Dublin.

Fowler, J. K., House Physician to Addenbrooke Hospital, Cambridge.

Furner, E. J., F.R.C.S.E., Consulting Surgeon to the Sussex County Hospital, Brighton, on resigning as Surgeon.

Furner, W., F.R.C.S.E, an Assistant Surgeon to the Sussex County Hospital, Brighton.

Husband, C., M.R.C.S.E., Medical Officer of Health for the Ripon Urban Sanitary District.

Jackson, A., M.R.C.S.E., a Surgeon to the Sheffield General Infirmary.

Jeffries, W. C., L.R.C.P.Ed., L.R.C.S.Ed., Resident House Surgeon and Registrar to the Cancer Hospital, Brompton.

Jones, A. H., M.R.C.S.E., House Surgeon to the General Infirmary, Northampton.

Kidd, A. N., M.D., L.K.Q.C.P.I., F.R.C.S.I., Medical Officer, &c., for the Ballymegran Dispensary District of the Dungannon Union, and the Caledon District of the Armagh Union.

McAfee, W., M.D., M.Ch., L.M., Resident Medical Officer to the Parish Infirmary, Liverpool.

O'Carroll, M., L.M. & L.S., L.M.K.Q.C.P.I., Medical Officer, &c., for the Clane and Timahoe Dispensary District of the Naas Union, co. Kildare.

Page, F., M.D., Assistant Surgeon to the Newcastle-on-Tyne Infirmary.

Robinson, G. W., L.R.C.P.L., M.R.C.S.E., Resident House Surgeon to the Royal Albert Edward Infirmary and Dispensary, Wigan.

Sankey, H. R. O., M.R.C.S.E., Resident Medical Officer and Registrar to the National Hospital for the Paralysed and Epileptic.

Stockwell, J., M.B. C.M., Medical Officer and Public Vaccinator for the Parish of Middleble by Ecclefechan.

Taylor, H., M.D., Medical Officer for the Kingsclere District and the Workhouse of the Kingsclere Union, and Medical Officer of Health for the Kingsclere Sub-district of the Kingsclere Rural Sanitary District.

Tennent, W. A., L.R.C.P., Medical Officer of Health for the Holme Cultram District.

Willcocks, I., M.R.C.S.E., L.S.A.L., Medical Officer for the Overton District of the Whitchurch Union, Hants.

Marriages.

Klein—Mawley.—On the 25th inst., at St. Gabriel's, Warwick Square, S.W., Edward Emanuel Klein, M.D., F.R.S., to Sophia Amelia, widow of George Mawley.

Deaths.

Embleton.—On Jan. 16, at Beadnell, Northumberland, Robert Castles Embleton, L.R.C.S.Ed., aged 69.

Leadman.—On Jan. 16, at St. Ives, Headingley, Leeds, Alexander Leadman, L.S.A.L., aged 57.

Martin.—On Jan. 12, at Grafton Street, Dublin, Dominick Martin, M.R.C.S.E., aged 71.

Mayne.—On Jan. 16, at Honiton, Robert Furlong Mayne, M.D. aged 45.

Smith.—On Jan. 17, at Torquay, Wm. Frank Smith, M.D.

IRISH POOR-LAW INTELLIGENCE.

VACCINATION LAW AMENDMENT.

WE recently announced that the Council of the Irish Medical Association was following up its scheme for the reform of the Irish Registration System by a similar measure for the amendment of Vaccination law, so as to make it more efficient for its purpose, and less cumbersome in its working. The Bill suggested by the Association has been completed, and it consolidates the whole Vaccination Law into one comprehensible and comprehensive measure, but an alternative measure is also provided, which enacts the needed reforms, but does not attempt consolidation. The Bills are to be presented to Sir Michael Hicks Beach, by a Deputation of the Association, and as a preliminary, the following letter has been forwarded to the Chief Secretary. It embodies some of the leading amendments, and we recommend it to the consideration and criticism of the working men of the Vaccination system throughout Ireland.

IRISH MEDICAL ASSOCIATION,
ROYAL COLLEGE OF SURGEONS,
DUBLIN, 20*th January*, 1877.

To the Right Hon. Sir M. E. HICKS BEACH, Bart., M.P.,
Chief Secretary for Ireland.

SIR,—By direction of the Council of the Irish Medical Association, I have the honour to ask your attention to the Public Vaccination Laws at present in force in Ireland, which, if they were in a great measure assimilated to those of England, the Council consider would be a material advantage to the public and the State.

In order to facilitate your inquiries, the Council have drawn up a Bill with a view to the *consolidation and amendment of the several Acts of Parliament regulating Vaccination in Ireland.* Should this Bill be considered too extensive, the Council have prepared another Bill, which *simply suggests amendments of the Acts at present in force* (a copy of each of which I have the honour herewith to forward to you). The Council earnestly hope that either of these Bills may meet with your approval, and that you may see fit to bring the same before Parliament.

For your convenience a note appears in the margin at the left hand side, opposite to each clause, showing the sections from Acts of Parliament now in force, which have been introduced, some of which have been slightly modified as noted.

The Council are of opinion that it would be advantageous to all interests if the time prescribed for compulsory vaccination were limited to three months, as in England. The vaccination of the children of the wealthier portion of the population of Ireland is voluntarily performed within that time, whilst the poorer classes generally wait until the expiration of the prescribed time (six months at present), when it too frequently happens that *dentition*, or some derangement of the system of the infant (usually occurring at that time consequent upon "weaning"), requires postponement of vaccination, often until the dentition has been completed; and to this course in a great measure must be ascribed the trouble and inconvenience suffered by the public, and those entrusted with the carrying out of the law.

Under existing law the certificate of a child's successful vaccination is forwarded to the Registrar of the district in which the vaccination was performed, but the Council are decidedly of opinion that such certificate should be forwarded to the Registrar of the district in which the birth of said child occurred (as in England); for it happens very frequently, particularly in large towns, that a child born in one district is vaccinated in another. The existing arrangements cause great trouble to the Registrars of both districts, tend to omission of registry of births, frustrate the surveillance of vaccination, and render it extremely troublesome, if not almost impossible, for the Registrar to check the vaccination performed, and see that none escape. If the suggestion of the Council with regard to this matter were adopted, much labour, expense, and annoyance would be obviated, and the return required to be made every six months (Form P.), showing the list of all children who do not appear to have been vaccinated would be greatly reduced. This return, under the existing arrangement, imposes upon the Registrars (who are the dispensary medical officers) the trouble of making out often a very long list, stating many particulars concerning children who have actually been successfully vaccinated under the provisions of the law. It is then laid before the guardians of the union, who direct the relieving officers to make inquiries regarding each defaulter, resulting in almost every case in proof that the vaccination was duly performed in some other district, whereby the guardians, the medical officers, and the relieving officers incur odium from the persons who had been questioned.

The Council, being of opinion that perfect vaccination in each case is as important as universal vaccination, consider the system in operation in England of granting "awards" to those public vaccinators who achieve the most satisfactory results should be extended to Ireland, and that such a course would prove to be the best possible stimulus to public vaccinators in Ireland to ensure perfect vaccination.

The report of the medical officers of the Privy Council and Local Government Board for England shows that the awards granted in England in the year 1875 amounted to a sum of £15,676, whereas, no premium is offered to successful vaccinators in Ireland.

The dispensary medical officers, who are the public vaccinators in Ireland, and number about 823, are constantly complaining to the Council of the inadequacy of the fees paid to them for public vaccination, and also of the disparity which exists between such fees in England and Ireland; and with good reason, for the minimum fee in England is 1s. 6d., the maximum being 3s., whereas, in Ireland the *maximum* is but 1s. for each case. This discrepancy is not only anomalous, but might tend to prevent public vaccinators in Ireland taking as much interest in the results of vaccinations performed as their brethren in England; and as it has been abundantly proved that (notwithstanding the inadequacy of their remuneration) the public and the State have derived even greater advantages from their labours than have been obtained in England, the Council are of opinion that the Irish public vaccinators are therefore entitled to at least equal remuneration.

Instead of the mileage allowances paid in England, the Council are of opinion that an uniform fee of 2s. 6d. for

each successful vaccination performed would prove more satisfactory in Ireland; that it would be but a matter of justice to grant an equivalent for the higher fee paid in England, which it would be found as nearly as possible to average, whilst it would cause a beneficial result not only to the public and the State, but also be a just recognition of the undoubted services of the public vaccinators of Ireland, who have too long been insufficiently remunerated.

When the dispensary medical officers of Ireland are called upon to prosecute defaulters under the Vaccination Acts, they frequently have not been paid, although a discretionary power is given to the magistrates before whom such cases are heard to allow such remuneration as they think fit for such services, which are not only most disagreeable, but positively detrimental to the interests of the medical officers. The Council are of opinion that the magistrates' discretion as to the amount of the remuneration for such objectionable services should be limited, and that whilst in no case they should be empowered to grant more than three guineas a day, they should not have the power of refusing to such officer the small fee of at least one guinea a day for his compulsory attendance at prosecutions.

In conclusion, I am further directed to express the hope that you will have the kindness to appoint a day to receive a deputation from the Council to confer with you on this subject.

I have the honour to be, Sir,
Your obedient Servant,
JOHN H. CHAPMAN, Hon. Secretary.

60 Pembroke Road, Dublin.

THE SUPERANNUATION PETITION.

WE understand from Dr. Chapman, Hon. Sec. of the Irish Medical Association, that up to Monday last numerous boards of guardians had signed and returned the petition to the House of Commons in favour of payment of half the superannuation allowance out of the Consolidated Fund, which petition had been drawn up and forwarded to them by the Council of the Irish Medical Association. Considering that so short a time has elapsed since the circular was issued—many of the boards not having met since—this result must be regarded as very satisfactory, and no doubt the expression of opinion will have much influence on the Government.

DISPENSARY HOUSES.—KILRUSH GUARDIANS.

Castlepark, Kilmihill,
18th January, 1877.

GENTLEMEN,—I take the liberty of bringing under your notice the unfitness of the room in which your dispensary medicines are placed in for the month at Kilmihill. The room is not boarded or ceiled, has no fire-place. The wind and rain comes in through the walls and windows, and is damp, which must destroy the medicine and injure the health of any persons who would be obliged to attend there. We came to the conclusion they are unfit, and could not be altered into a suitable dispensary. Walsh's room is up a steep and narrow stairs, not two feet wide; has beds in it, and imperfectly lighted. As the vice-chairman now I respectfully protest against the medicines having been removed, without the consent of the committee, into a room which must destroy their efficacy, it being unfit to be accepted by your medical officer, the dispensary committee, or the poor, whose necessities would oblige them to attend there.

E. B. BROWN,
Vice-Chairman, Kilmihill Committee.

Rose Cottage, Knock,
18th January, 1877.

SIR,—I received yours of the 16th instant. I inspected the premises at Kilmihill, tendered by Walsh and Coghlan, for a dispensary. Neither one or the other is at all fit or suitable, and I strongly object to occupy either. Walsh's is a dark, lofty and open room (approached by narrow stairs) where I could neither read or write. In conclusion I beg to state that I cannot or will not submit to the indignity or inconvenience to which I am subjected at Kilmihill. I have no place to sit down in, or attend to my business, except a dirty wet "hovel," where the medicines, &c., that were of value are now heaped up in a confused mass. I hope such a state of things won't be allowed to exist any longer.

I am, Sir, yours truly,
J. B. SULLIVAN,
Medical Officer.

Considerable discussion arose on the subject, ending with a resolution *to accept Walsh's tender*, the tenancy to be for a year.

CARLOW UNION.—ELECTION OF MEDICAL OFFICER.

LAST week there was a special meeting of the Board of Guardians of Carlow Union, the largest which has been held for years past, for the purpose of electing a medical officer to the workhouse in the room of Dr. Thomas J. Rawson, resigned, at a salary of £100 a year, the candidates being Dr. Edward A. Rawson (son of Dr. J. T. Rawson) and Dr. Thomas P. O'Meara (son of Dr. Thomas O' Meara, J.P.), both of whom produced excellent testimonials and diplomas. Mr. Henry Bruen, M.P., proposed Dr. Edward Rawson. Captain D. W. P. Beresford proposed Dr. Thomas P. O'Meara; Dr. O'Meara seconded the appointment of his son. A division was then taken, when there appeared for Dr. O'Meara 13; the remainder of the Guardians (40) present supported Dr. Rawson, who was accordingly elected, Dr. O'Meara stating that he would represent the matter to the Local Government Board.

We have been informed that, in the course of the canvas preceding this election Dr. O'Meara, the unsuccessful candidate, printed and issued to all the Guardians a circular, in which he set forth in a list all the medical appointments held by Dr. Rawson, with the view of showing that that gentleman, if elected, would not be able to discharge all his duties satisfactorily. The list contained several appointments which were honorary, and involved no loss of time, and in so far was a misrepresentation of the real facts, but whether true or not, it seems to us that such a method of canvassing, and such an attempt to injure the prospects of a competitor, is neither professional nor creditable to the person employing it, and—though we are not specially interested in either candidate—we cannot but rejoice that the method adopted by Dr. O'Meara to impress upon the electors the disqualifications of Dr. Rawson has proved unsuccessful. We should not be surprised if he seriously damaged his own cause thereby.

BOYLE UNION.

VACCINATION FEES.

THE following resolution was drawn up having reference to the fee paid Dr. Drapes for prosecuting defaulters under the Vaccination Act, but which the auditor refused to sanction, as no magistrate's certificate had been procured by the doctor.

Resolved, that the Local Government Board be requested to sanction the £1 1s. paid to Dr. Drapes for giving evidence in prosecuting defaulters under the Compulsory Vaccination Act. This is the cheque referred to in auditor's report at his recent audit, a copy of which appears on minutes of 19th December. The Board were decreed by the Chairman of Quarter Sessions in the case of Kirby *v.* Guardians. The chairman stated a magistrate's certificate was not necessary. The Board paid the amount to prevent litigation,

Passed unanimously.

WEXFORD UNION.

ANTI-SUPERANNUATION AGITATION.

Mr. Walsh read letters, from which it appears that Mr. Boxwell wrote to the Local Government Board complaining that one or two members of the committee sh ould hold agitation meetings in the dispensary house with out acquainting the doctor thereof. In reply to Mr. Boxw ell the Local Government Board stated that meetings of the Dispensary Committee can only legally be held as provided for in articles 7 and 11 of the Dispensary Regulations. These articles provide that meetings be held every time it is essential to hold them ; it was a regular meeting held in Killinick for the purpose of appointing a guardian, and to pass a resolution condemnatory of superannuation.

Dr. Boxwell—Mr. Chairman, it was reported to me that a meeting was held in the dispensary room Broadway, and another in Killinick, for the purpose of opposing superannuation to Dr. Furlong, which as soon as reported to me I wrote up to ask the Local Government Board. You have heard my letter and the answer. I do not recollect who is the person that told me.

Mr. Walsh—I think, sir, it was really too bad to go behind backs in this way.

Dr. Boxwell—I deny I went behind anyone's back. I am under the impression that a dispensary cannot be used for any purpose like that.

Mr. J. H. Boxwell—Do you remember any business done that day in the dispensary ?

Dr. Boxwell—I object to the house being used for anything but the doctors' purposes.

Mr. B. Furlong—Was not the meeting held on Sunday ?

Mr. Walsh—It was held on Sunday.

Mr. Howlan—And in the dispensary house ?

Mr. Walsh—I do not know.

Mr. Furlong—At that meeting there were twenty-five names given, seventeen resident and eight non-resident ratepayers.

Mr. B. Furlong—There were ten names attached to that list who did not attend the meeting at all.

Mr. Walsh—I am in a position to tell you that these persons authorised their names to be attached thereto, and signed the requisition calling the meeting.

Mr. B. Furlong—To show how lame they were they put the resolution in the hands of a little child only twelve years of age. All the gentlemen here are quite familiar with the resolution.

Mr. J. Walsh—He was no child, and was quite competent to judge of the resolution.

Correspondence.

CORONER'S MEDICAL WITNESSES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Would you kindly state in the columns of your journal whether there is any redress likely to be obtained in the following case :—

On the 11th November last I was requested to attend an inquest on a farmer who met his death suddenly on his return from a neighbouring market town, The inquiry was adjourned in consequence of the coroner being obliged to hold another inquest on the same day, and also because the authorities and the jury required that a *post-mortem* should be made, as there were suspicions of foul play entertained. Owing to the lateness of the hour I was unable to make the *post-mortem* on this day, so I had to come on the following morning (Sunday) to make the required examination. Subsequently, I had to attend at the adjourned inquest, making in all three attendances and a *post-mortem* examination. For this I was allowed by the County Board of Superintendence the paltry sum of two guineas.

As the place where the inquest was held is about 4½ miles from my house, you will easily see that the sum I received would do little more than pay car-hire at 1s. per mile, not to speak at all of driver's fees.

The coroner did all in his power to get me paid four guineas for my services in this case, but the Board informed him that while they acknowledged the hardship of the case, they felt themselves powerless to allow more than the sum above-mentioned. It appears that, according to their reading, the Coroner's Act (9 & 10 Vic., c. 37) does not contemplate adjournments of inquests, and consequently does not permit the grand jury to allow more than one guinea—or, in the case of a *post-mortem*, two guineas—for the evidence of a medical man, no matter how often he is obliged to attend. On reference to the chapter on "The Office of Coroner" in the "Irish Medical Directory," the information conveyed in the paragraph on medical witnesses would seem to favour the above view.

If such be the state of the law, it might be no harm if the Irish Medical Association took the matter into consideration, with a view to having it remedied. It is a very great injustice to a medical man to be obliged to attend two or three adjourned inquests, often at a considerable distance from his house, and to receive only a fee to which one attendance would have legally entitled him.

I am, Sir, yours, &c.

M. N.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I was called upon by the police, who were directed by the coroner, to make a *post-mortem* examination on a body buried for some days, and on a subsequent day to attend as a medical witness before a coroner's jury. It was necessary to travel 36 miles in connection with this case, in addition to the loss of two entire days. I have received this morning a sum of £2 2s. from the coroner as the "legal" remuneration for my loss of time, travelling expenses, &c. Would you kindly inform me what steps, if any, can be taken to recover reasonable expenses. I am, &c.,

H. D.

[Our correspondents, we fear, have no redress. The Coroner's Ireland Act (9 and 10 Vict., cap. 37) does not refer in any one of its clauses to an adjournment. It speaks of *one* inquest always, and provides, for the payment of the coroner and all persons concerned, a fee of so much per inquest not per day. The clause (28) under which medical witnesses are paid, is as follows :—

And be it enacted, that it shall and may be lawful for any coroner who shall hold any inquest to pay any medical or other witness who, having been summoned by him, shall attend and be examined at such inquest. . . . any sum or sums of money, not exceeding the sum contained in the Schedule (C.) hereunto annexed, as to such coroner shall seem just and reasonable, upon obtaining from such witness or other person a receipt duly signed for such payment.

SCHEDULE (C.)

Table of payments which any coroner . . . may make to any witness or other person who, being summoned, shall attend and give evidence at an inquest.

To any legally qualified medical practitioner who, in pursuance of the summons and order of any coroner, or of any two magistrates, shall attend and examine any dead body, and give evidence as a witness at any inquest held thereon, the sum of ... ... £1 1s. 0d.

To any legally qualified medical practitioner, who, in obedience to the order of any coroner or of any two magistrates, shall make a *post-mortem* examination of any dead body, and shall attend and give evidence at the inquest held thereon, the further sum of ... ... £1 1s. 0d.

The coroner himself is only entitled to £1 10s. per inquest, and if the Balham poisoning case had occurred in Ireland, neither the coroner nor the medical witness who was summoned by him could receive more than these fees for their attendance of three weeks. Probably the omission in the Act of any reference to an adjournment was intentional, and for the purpose of withholding from the coroner any inducement to delay the finding of a verdict. It works, however, very badly. Causes cases to be hurried over and guess-verdicts returned. The Chief Secretary for Ireland has promised to deal with the whole question of Irish coroner's law next session, and, no doubt, the Irish Medical Association will then do its best to relieve medical men of the hardships of which our correspondents complain.]

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING JAN. 20, 1877.

Total registered deaths in Dublin and suburbs * ... 197
Ten years average of same week 187

Decrease of mortality below average 10
Ratio of deaths, suburb of Rathmines ... 9·7 per 1,000
" " " Donnybrook† 30·4 "
" " " Blackrock ... 28·9 "
" " " Kingstown ... 36·5 "
" " Entire Dublin district ... 32·6 "
COMPARATIVE RATIOS—London ... ... 21·0 "
" " Glasgow... ... 28·2 "
" " Edinburgh ... 20 7 "

* District extends over 10,050 acres, and contains 314,66 persons.

† This district includes City of Dublin and Incurable Hospitals.

Referring to institutions, it should be stated that of 22 deaths returned for the South Dublin Union Workhouse, only 7 took place during the week.

The number of deaths from zymotic diseases registered during the week is 36 ; average number in the corresponding week of the previous ten years 37·2. Of the deaths from these diseases recorded last week, 15 were from fever (3 typhus, 7 typhoid, and 5 simple continued fever), 4 each from scarlet fever, whooping-cough and diarrhœa, 2 each from measles and diphtheria, 1 from croup, &c.

Eighteen children died from convulsions.

Bronchitis proved fatal in 31 instances, pneumonia in 10, and lung disease unspecified in 4.

Heart disease caused 7 deaths, pericarditis 1, paralysis 8, epilepsy 1, brain disease unspecified 3, jaundice 1, liver disease unspecified 2, disbetes and Bright's disease 1 each, and kidney disease unspecified 2.

Twenty-two deaths resulted from phthisis, 4 each from mesenteric disease and hydrocephalus, and 5 from cancer.

Three accidental deaths and 1 case of suicide were registered.

Sixty-five of the deaths registered occurred in hospitals and other public institutions ; of this number 10 took place in the North Dublin, and 22 in the South Dublin Union Workhouse.

Six deaths from scarlet fever, 5 from measles, 3 each from fever and whooping-cough, and 6 from diarrhœa, were registered in Belfast during the week.

EXTRACTS FROM REGISTRARS' NOTES

For the Last Quarter.

(Continued.)

BAILIEBOROUGH ; *Bailieborough, W.*—The sanitary arrangements of this district are very good ; every officer in this department takes a lively part in instructing the people and pointing out improvements, and I hope in a short time a wonderful deal of good will be effected.

BALROTHERY ; *Malahide.*— It is remarkable that no death occurred between the 16th June and 27th August, and speaks well far the saditary state of the district.

BALROTHERY ; *Swords.*—Of the deaths registered, 3 were respectively aged 78, 74, and 71. Typhoid fever and 2 cases of typhus prevailed during the past quarter.

DUNDALK ; *Carlingford.*—The district is much improved as to its sanitary condition, and except for whooping-cough is free from any epidemic for some time.

KELLS ; *Kells, W.*—The number of deaths from scarlatina registered this quarter amount to 10, but there are upwards of 50 cases of the disease at present on the visiting list of the dispensary. The fatal cases, as usual in every epidemic, all occurred in the over-crowded ill-ventilated cabins with which the district abounds.

NAAS ; *Newbridge.*—Typhus fever has been very prevalent in and about this town during the past quarter, although sanitary arrangements are well carried out in most of the houses in which the disease occurred. Three cases of typhoid fever occurred in one family, residing in a lodging-house in this town, owing to the very filthy state the two rooms occupied by these people were kept.

SOME PRACTICAL REMARKS ON AURAL AFFECTIONS.

By H. Macnaughton Jones, M.D., M.Ch., F.R.C.S.I. and Edin.,

Surgeon to the Cork Ophthalmic and Aural Hospital, with Special Throat Department.

(*Continued from page 59.*)

History of the Case.—Having ascertained the general state of health of the patient, the first step is to inquire into the length of time the deafness has lasted, if both ears are affected, and if so, the manner in which both were attacked; next to note carefully the nature of the progress of the deafness, if this has been rapid or insidious, with or without pain or discharge. The careful examination and comparison of the hearing power of the two ears is requisite in every instance. Patients constantly affirm that the hearing of one ear is perfect, yet on coming to test it accurately we may find it seriously impaired, the reason of this being that while the conversational power is not impaired, the hearing distance as measured by the watch, is considerably so. We should now seek closely for some cause, making inquiries into the habits, occupation, state of health at the time of or preceding the invasion of the symptoms. The connection of deafness with the exanthemata is a point which should not here be overlooked, these and the various fevers being frequent causes of deafness. Gout also and syphilis should not be forgotten, the former particularly, both as a direct and hereditary source of mischief. The occurrence of tinnitus is a constant symptom. We should inquire then carefully into the history of the noises heard; how and when they commenced, their nature, if they have increased of late, if they are periodical or liable to exacerbations. Tinnitus may be caused by almost any abnormal state of the meatus, membrane, middle ear, labyrinth, or Eustachian tube, and therefore it is only valuable as a diagnostic sign when taken in conjunction with other symptoms and appearances. The most frequent causes in the external meatus met with in general practice are cerumen, foreign bodies, abscess, exostosis, polypus. It is surprising the minute portion of cerumen which, if it infringes on the membrane, will produce this unpleasant complication. This week I was consulted by a gentleman for noises in the ear; the hearing power was normal, and on examination I found the drum healthy and the only discernible cause a small collection of cerumen which was close to the membrane, and which perhaps had been pushed further in by that most reprehensible of all practices, namely, attempts to clear out the ear with pieces of rolled paper, or the end of a towel, &c. On gently syringing out the ear I removed with the small atom of cerumen a hay seed, which had escaped my notice, lying, as it did, flat against the wall of the meatus. It is difficult to isolate those states of the membrane itself, which cause tinnitus, for in my experience nearly all its abnormal appearances and positions, as increased concavity, dulness, thickening, want of mobility, are secondary results due to faults pre-existing in either the cavity of the tympanum or in the Eustachian tube. The fact that there is a large number of cases in which relief is given when air is forced into the cavity of the tympanum by Politzer's bag, and the membrane temporarily restored, or when the tension is lessened by the suction through a tube placed in the external meatus, or by the pneumatic speculum, proves the practical importance of noting the position and appearance of the membrane in all such cases. We shall have occasion subsequently to consider the effect of spasm of the tensor tympani or chronic contraction of this muscle in producing permanent alteration in the appearance of the membrane, and frequently incurable tinnitus.

Perhaps of all the causes of tinnitus there is none so frequent as mucus in the cavity of the tympanum. The diagnosis of this condition we will consider presently. It is frequently accompanied by closure or obstruction of the Eustachian tube. The occurrence of tinnitus during ordinary catarrh in the head when the nasal mucous membrane and that lining the faucial orifice of the tube is congested, proves how slight a cause will give rise to this symptom if there is any obstruction to the passage of air or

fluid through the natural outlet. Excluding causes existing in the external meatus, the membrane and cavity of the tympanum and the Eustachian tube, we have to deal with a large class of cases in which the cause is in the labyrinth, the semi-circular canals, or cochlea. Many of these cases have a distinct train of symptoms described so accurately by Menière under the head of labyrinthine vertigo. The most usual attendants are giddiness, tendency to fall, staggering gait, occasional vomiting, and various degrees of tinnitus. Such symptoms may undoubtedly be produced by other disordered states than those taking their origin in the labyrinth, and may be secondary from the results of disease in the tympanum, or any cause producing labyrinthine pressure. For example, in those cases in which relief is afforded, and the noise disappears on suction with a tube in the meatus, the cause is, as pointed out by Mr. Hinton, muscular, and the stapedius and tensor tympani are in a state of chronic contraction. There is at present a man, aged forty-eight, attending the hospital, who came on the 20th of October, with the following symptoms :—He for some time past had, as he described it, "a reeling in his head." His gait was staggering, he had to place his hand against the wall to support himself. He was he said "more like a drunken man," and on his way to the hospital, to which he was assisted by his wife, he thought that he should have been taken for one. He had musical sounds in the left ear. He did not hear the watch on contact in this ear. He had great pain, and had not slept for ten nights previous to his visit. He looked worn and pallid. His tongue was coated with a creamy fat, and he had a difficulty in retaining any food on his stomach. On examining the meatus, I found the orifice occluded with discharge, on washing which out I discovered a large fibroid mass filling up the meatus, quite unlike an ordinary polypus. On closer examination, I found that this sprung from the tympanum. The hearing of the other ear was normal, and the appearance of the membrane healthy. There were no noises in it. I snared the growth as well as I could, and brought away the greater part of the mass. I gave him twenty grain doses of bromide of potassium, vesicated him freely over the mastoid process, and regulated his diet. The meatus was considerably swollen and narrowed. From this until the 27th, I kept the meatus clear, cleaning it out daily, and removing the small remaining portion of the polypoid growth with the lever ring or rectangular forceps, and making him continue the bromide of potassium. On this date, I have a note that the "reeling is much better, sleeps well at night." On walking, he still had to place the hands to the wall, and his wife led him to hospital. I now touched the remaining granulations with chloro-acetic acid, and chromic acid alternately. On the 3rd November, the pain was much less, the meatus was still considerably contracted; it was cleaned out every second day; the noises were much less, and his gait was improved; there was great pallor and debility. I now gave him thirty drop doses of the muriated tincture of iron. On the 17th of November, I reverted to the bromide of potassium. The treatment has been much the same since that date. A twenty-grain solution of nitrate of silver has been occasionally used to the membrane and meatus. This latter is now employed, and all the mass has been removed or destroyed. He has returned to his work. His gait is perfect, he comes to the hospital regularly, there is no pain, the discharge has nearly ceased; there is still no hearing in the ear, but the tinnitus has gone; there is a large perforation of the membrane, all pulsation in which has ceased for the past week. In this case there can be little doubt that all these formidable symptoms were caused by pressure, conveyed to the labyrinth by the fibroid mass, which destroyed the membrane, and encroached on the tympanic cavity.

There are, however, constantly occurring cases in which the tinnitus depends on no assigned cnuse, if we except the ambiguous class of nervine. Deafness in such is not a necessary attendant. The only symptom complained of is the constant noise. These cases I find are as a rule incurable, and resist any form of treatment. On examination the membrane is healthy, there is no abnormal sound heard with otoscope, the throat and faucial orifice of the Eustachian tube are healthy, the deafness may be slight and conversational power not in the least affected, yet the tinnitus is intolerable. Some of these date the origin of their trouble to nervous shock, some to the occurrence of fever, the administration of medicine, climateric influences, as residences in India. The sole clue to the mischief usually obtainable is by means of the tuning-fork, which only yields negative results. No good that I am aware can be effected by any local treatment when such a state supervenes. That quinine produces symptoms in some analogous to labyrinthine vertigo is well known. Though I have in the Cork Fever Hospital and in private practice constantly administered quinine in remittent fever, and as an anti-pyretic in ten to fifteen grain doses, as often as every third hour, producing at times headache, tinnitus, and vomiting, I have never known any permanent effects from its administration. Many years since, while making some experiments in which I was assisted by the late Professor Blyth, I gave a healthy man, a pensioner, 30 grains of quinia (the alkaloid) for the purpose of estimating the total amount of quinia excreted by the kidneys for twenty-four hours subsequently (*vide* paper on the "Action of Aconite and Quinine," Dublin MED. PRESS AND CIRCULAR). This man suffered for a considerable time from tinnitus and partial deafness, this continuing for nearly twelve months, gradually becoming less. He died eventually several years later from the effects of alcohol. The tinnitus and deafness never completely deserted him. I am aware of a case in which the reeling and staggering gait produced by quinine, simulating those symptoms present in labyrinthine vertigo, has been mistaken for drunkenness, with most unpleasant consequences to the sufferer. In inquiring into the origin of tinnitus we must not forget such causes as exposure to cold, bathing, nervous shock, general debility, hysterical temperament, mental excitement and worry, overstrain at business, general depression of spirits, exposure in open boats, the effects of gunnery experiments, and blows on the ear. I have had a patient in whom troublesome tinnitus has been produced by snuff which had entered the Eustachian tube and the cavity of the tympanum, the tinnitus being removed on washing out the cavity of the tympanum and clearing the tube. Women during the meno-pause in consequence of hæmorrhages, young girls with irregularities of menstruation, and attendant general hyperæmic or anæmic states, especially those who are the victims of severe neuralgia, are frequently attacked by troublesome tinnitus. In children deafness with tinnitus may be caused by the exanthemata, whooping-cough, mumps, and worms. Morbid states of the general system dependent on diseases of the heart, kidneys, and liver, are frequently accompanied by tinnitus. The changed and rigid arterial coats which are the result of renal disease may, when their calibre is narrowed, as pointed out by Dr. Jago, produce tinnitus. So also tumours in the cervical region, alterations in the blood-current in the carotid or basilar arteries or aneurismal condition of these vessels, or disease in their coats may be the source of this symptom. The over-indulgence in alcohol or tobacco may give rise to it. The importance of the abuse of tobacco in causing deafness is, I believe, frequently overlooked. I have had many cases of deafness without apparent pathological changes in confirmed smokers, in which, when the habit was relinquished, considerable and permanent improvement has taken place. Turnbull, in his treatise on "Tinnitus Aurium," makes reference to the association which exists between the advent of the noises and insanity. I have asked my friend Dr. Ringrose Atkins, of the Cork Lunatic Asylum, to furnish me with a report on this subject from the large number of insane cases in that institution. His conclusions I shall report in these papers. It would appear that as Troltsch has said, there is a "nervous tinnitus aurium" and a "material or acoustic which may exist

at the same time"—a double set of hallucinations, one distinctly aural, the other cerebral. Schwartze's opinion, quoted by Turnbull, however, is most important—"subjective aural sensations, which are caused by demonstrable affections of the ear, may, in predisposed persons, especially when there is hereditary tendency to mental disease, become the direct cause of aural hallucination, that may accelerate the outbreak of mental disease." Anyone who has seen the distress caused to some by the unceasing roar in the head, and heard their declaration that "the noises would drive them insane if not relieved," must recognise the importance in all those cases where aural tinnitis accompanies mental hallucination, of making a careful examination of the ear. Certainly there can be no doubt that such aural complication may accelerate and increase the mental affection. As regards the character of tinnitus, I do not find that this, as a rule, makes much practical difference. Habits and occupation may have something to say to this. I have usually found that the milder and more removable symptoms are described as a "buzzing" or "singing," such as when cerumen is present, or a foreign body in the meatus. A "drumming" in the ear I have noticed frequently, with temporary closure of the Eustachian tube. In a gentleman with old tympanic mischief and evidence of nervine impairment, the chief thing complained of was the occasional fancy that he heard persons addressing him, causing him to turn round to discover who was speaking to him. This hallucination of voices in the ears is, in my experience not common. I have myself, when overworked and dyspeptic, suffered for days from an unpleasant knocking in the ear coming on at intervals, a state which I am in the habit of relieving occasionally by a powerful inflation of the membrane. Mr. Hinton drew attention to the value in a diagnostic point of view of the musical nature of the sound in cases of nervine deafness. This accords with my own experience. But I have more frequently found a loud roaring or rushing noise complained of in those cases where the deafness was slight, and in which the tinnitus yielded to no treatment, and where no abnormal state recognisable, save with the tuning-fork, existed to account for it. I have come to look on these musical sounds, and those likened to the roaring or rushing of water as the most unfavourable in diagnosis. I shall refer to the treatment of tinnitus in dealing with the diseased conditions which give rise to it.

To be continued.

ON AN EXTENSION APPARATUS FOR THE TREATMENT OF FRACTURES AND CERTAIN DEFORMITIES OF THE LOWER EXTREMITY. (a)

By William Stokes, F.R.C.S.,
Professor of Surgery, Royal College of Surgeons; Surgeon to Richmond Surgical Hospital; Fellow of the Royal Medico-Chirurgical Society of London.

It is more than sixty years since John Bell published the following statement: "It is, I fear, but too certain that while more has been written on the subject of fractures than on hernia, lithotomy, amputation, or trepan, yet no two books correspond, no two authors agree even on the general points of practice; and every surgeon, whether in the army or in the navy, in a village or in a city, sets a broken limb, as he writes his name, after a fashion of his own." There can be little doubt, I think, that in the present day the truth of the passage just quoted holds equally good, especially as regards the diversity of opinion that exists in reference to the best means of treating fractures of the shaft of the femur. This has doubtless arisen from the difficulty, in fact, the impossibility in many cases, if any of the ordinary splints be used, of obtaining what all surgeons look to in the treatment of fractures of the long bones—viz., union without deformity or shortening. The unanimity of opinion as to the impossibility of obtaining union without shortening in fractures of the shaft of the femur among the most eminent surgeons of antiquity as well as of modern times is very remarkable. Thus Celsus observed: "If the thigh be broken it will be made shorter, because it never returns to its former state." Avicenna remarked: "It is a rare thing for the thigh once broken to be perfectly cured again." John Bell said, "the machine is not yet invented by which a fractured thigh-bone can be perfectly secured." And B. Bell expressed the opinion that "an effectual method of securing oblique fractures in the bones of the extremities, and especially of the thigh-bone, is, perhaps, one of the greatest desiderata in modern surgery." Nélaton stated that "shortening of the, limb is almost impossible wholly to prevent;" and when the fractures overlap, "we must," said Malgaigne, "look for shortening as almost inevitable." And lastly, Prof. V. Mott was of opinion that "more or less shortening of the limb is uniformly the result."

The great liability to displacement accruing in this class of injuries is doubtless due to a two-fold cause—namely, muscular action and weight of the lower part of the limb. It was forgetfulness of this latter agency in producing displacement that caused P. Pott to fall into the error of taking cognisance only of muscular action as the sole agent in producing displacement, and hence the so-called "physiological method" is one rarely if ever now had recourse to in the treatment of fractures of the shaft of the femur, although the system had such distinguished converts as Dupuytren and Delpech.

It has been abandoned not only on account of the error just alluded to, but also from the impossibility of relaxing by any one continued position all the muscles, from the irksomeness of the patient's position, and the difficulty, in truth, impossibility, of ascertaining if the fragments are in close and proper apposition during the process of union. I do not wish in the slightest degree to underrate or undervalue the importance to surgery of Mr. Pott's doctrine, for many of the most improved modern fracture appliances are the direct outcome of it, such as M'Intyre's, Mayor's, the suspension method, and other devices; but still the verdict of the great majority of surgeons in this, and in all other countries, is unquesbly in favour of the extension and counter-extension method carried out in the manner recommended by Desault, Boyer, Liston, James of Exeter, Gordun Buck, of New York, and many other eminent surgeons. Undoubtedly, a great advance was made by Liston in the treatment of fractures of the shaft of the femur, but there are, in my opinion, certain disadvantages in his method, and among these may be mentioned—1st, that much of the force is lost from the obliquity of the counter-extending belt; 2nd, that the ankle and groin suffer from pressure; 3rd, that pressure on the groin often causes œdema of the limb. There is also the objection made by Earle, that the natural symmetry of the limb is likely to be impaired owing to the natural obliquity of the shaft being altered, from pressure being made at the inner side of the knee, the limb being bound by bandages to a perfectly straight body. "It is objectionable too," as Mr. Gamgee has observed, "from confining the patient in bed in a fixed position during the whole course of treatment—confinement peculiarly objectionable in children and in old people. The use of the bed-pan is inconvenient, and in consequence of the bandages becoming loose, it is necessary to re-apply them, and renewed extension almost every fortnight, to the patient's suffering, and it is fairly presumable, to the retardation of bony consolidation. But, in oblique fractures, just below the trochanter, with tendency of the upper fragment to tilting forwards and outwards; and in oblique fractures of the lower end of the femur with displacement of the lower fragment backwards and upwards, the long splint is almost always an unsatisfactory instrument, often altogether inadequate so

(a) Read before the Surgical Society of Ireland. The discussion will be found on page 106.

to obtain coaptation as to ensure reconsolidation without very manifest deformity." (*a*)

In Syme's method of the long splint and short no effectual extension can possibly be made. In fact, the only object he had in even attempting any degree of extension was not so much to restore the normal length of the limb as to "insure perfect rest of the limb." But it had the great advantage of not recognising the application of bandages which, as Prof. Syme observed, "though they look very neat when first applied, they soon require re-application. The state of the limb can never be ascertained without either raising the thigh to take off the bandage or cutting it up; and in the latter case the thigh must be raised in order to re-apply the bandage."

It appears to me, too, that to apply an extending force at the ankle to act on a deformity existing above the knee joint, is a doubtful procedure, for clearly the nearer the force is applied to the broken fragments, the greater is the power one has in reducing any displacement of them.

The frequent necessity for changing or re-applying the bandages, owing to their tendency to become loose, is to me another obvious disadvantage; and, lastly, the tendency to chafing in the groin, pain in the ankles must, along with the other disadvantages I have mentioned, act indirectly, at all events, in retarding union.

To devise an appliance which would enable the surgeon to get rid of the disadvantages I have mentioned, has for several years been to me a subject of consideration. This instrument, which I have been using for the last five years in the treatment not only of fractures of the shaft of the femur, but also other injuries and deformities of the lower extremity, while it gets rid of the various disadvantages I have spoken of that attend the use of Desault's or Liston's appliances, or any of the modifications of their splints, fulfil, I have found, the missing requirements of a permanent extension apparatus, such as may be desired in oblique fractures of the femur, tibia, and fibula, or in cases of contraction of ham-string tendons, partial anchylosis, with flexion of the knee-joint, morbus coxæ, and other injuries and deformities.

The instrument is not by any means as perfect as I hope ere long to see it; but the experience of five years, during which I have used it in various forms of injuries of the lower extremity, both in adults and children, has shown me that the principal indications are fulfilled, and the disadvantages I have spoken of existing in other extension appliances got rid of.

It consists of two parallel side splints, one for the inner and one for the outer side of the limb. These splints are made up of several pieces, varying in length, united by brass plates and winged screw nuts. The length of the apparatus can thus be adjusted so as to be suitable either to a child or an adult. At the upper end of the inner splint, fixed on a joint, is a pad which should be so arranged as to press on the perineum, and being on this joint the point of pressure remains the same, whether the patient be in the recumbent or in the sitting posture. The upper end of the outer splint need not be carried above the pelvis. The other ends of the two side splints are attached to what I would call the extending portion of the appliance. It consists of an inside skeleton box, which is made to slide on the outer parallel splints, and both these latter and the inside box are governed by a right and left or double-threaded screw. The distance between the two portions of the splint, the lower or extending, and the upper or counter-extending, can be increased or diminished by means of the screw above referred to, and which is similar to those that are used in what are called "telescope" tables, and it is placed posteriorly, and as I said before, governs both portions of the splint. To regulate the elevation of the limb, I have affixed a second vertical screw, similar to the one by which Liston's splint has been modified by Mr. Butcher. Across the extending portion of the splint or skeleton box are stretched bands, and on these the foot and lower part of the leg rest. Two strips of plaster are then affixed to each side of the injured limb, reaching almost as high up as the fracture. Those two strips of plaster are united below, and the loop is placed round the brass hook fixed in the sliding horizontal bar at the lower end of the extending portion of the splint. If the screw be now turned from right to left, a double action of extension and counter-extension is produced, the lower or extending portion of the splint being governed by one portion of the double-threaded screw, and the upper or counter-extending portion being governed by the other. Any pressure on the heel can be effectually prevented by using the second or vertical screw

To discuss the particulars of all the cases in which I have used this splint, during the past six years, would require a much longer period of time than that usually given to communications at this Society; but I may mention that I have used it in six cases of fracture of the shaft of the femur, 1 case of fractured patella, 3 cases of oblique fracture of the tibia and fibula, in two cases after division of the ham-string tendons for contracted knee, and in three cases of morbus coxæ; in these latter, for the purpose of keeping up a permanent and unvarying extension. It will be seen, therefore, that the splint is applicable to a great variety of injuries, diseases, and deformities, where rest, elevation, and extension are specially indicated.

As regards the vexed question as to whether union without shortening in cases of oblique fractures of the femur is possible, I can affirm that such a result can be obtained, and has been witnessed by my colleagues, myself, and the students in four cases of fracture of the femur. It is thus that two of these cases occurred in young persons aged respectively ten and thirteen years, periods at which it is much easier to obtain union without shortening. In two other cases, which occurred in men thirty-five and forty years of age, when the patients were convalescent, I brought them into the theatre of the Richmond Hospital, and invited any of those present who chose to come down and determine for themselves by careful and accurate measurement as to whether there was any shortening present or not. In one of these cases there was no difference of opinion as to the absence of shortening; in the other case a question was raised as to whether the injured limb was not slightly longer than the uninjured one. This I could not myself determine, but I quite admit the possibility of such a result being obtained, and it should make the surgeon very cautious not to apply a greater amount of extension than is absolutely necessary to restore the limb to its normal length.

In two other cases of fracture of the shaft of the femur (making in all six in which I have employed this splint, and one of which was quite recently under observation in the Richmond Hospital), there had been shortening previous to the accident, the result of morbus coxæ, from which affection both patients suffered in early boyhood. Both these cases made excellent recoveries. The other cases in which I have used this splint—namely, morbus coxæ, fractured patella (in conjunction with Sauborn's method), contraction of knee, and oblique fractures of the tibia, have not been as yet sufficiently numerous to justify me in speaking in any positive manner as to the value of the splint in such cases. But this much I can say, that in all the cases in which I have used it I have had no reason to be in any way dissatisfied with it, but quite the reverse.

To sum up: The advantages which I think may be reasonably claimed for this splint may be thus stated:—

I.—It is suitable for the treatment of a great variety of injuries, diseases, and deformities of the lower extremities.

II.—It can be adapted to children as well as to adults.

III.—In using it the use of roller bandages and necessary concealment of the parts can be dispensed with.

IV.—The power of extension is unlimited.

V.—The oblique perineal bandage, so frequently a

(*a*) Gamgee, "Researches in Pathological Anatomy and Clinical Surgery," p. 152.

source of annoyance to the patient and interference with the circulation in the limb, is unnecessary.

VI.—The use of the splint does not necessitate the patient remaining in the recumbent posture.

VII.—The arrangement for elevation of the limb prevents the possibility of any trouble arising from pressure on the heel.

VIII.—The patient is quite unable to relax the extending force.

Lastly, I may mention that in none of the cases in which I have used this appliance have I heard patients complaining of irksomeness or inconvenience caused by its application.

ON THE INDICATIONS AND CONTRA-INDICATIONS FOR THE EMPLOYMENT OF COLD BATHS IN THE TREATMENT OF TYPHOID FEVER.

By Professor M. Maurice Raynaud, Hôpital Lariboisierè.

Translated for The Medical Press and Circular from *La France Médicale*, Jan. 28, 1877, by T. M. Dolan, L.R.C.P. Ed., of Halifax, Yorks.

The discussion we have had relative to the complications of typhoid fever, attributed to Brand's method, the study he has made of the physiological action of cold baths, now allows us to draw some practical conclusions.

Amongst the most usual indications for cold baths, the first of all, without contradiction, consists in the state of the temperature. But it will not do for us to say that we shall treat by cold baths all patients with a high temperature. To regard the absolute height of the temperature at one moment will not be sufficient; we should be exposed to omissions often fatal, to useless intervention.

What is necessary for us to know, is the course of the temperature of the patient, and for that purpose we want a number of careful observations.

I am not here about to lay down the rules of clinical thermometry; it will be sufficient to remember, that in our public institutions, the temperature of each patient is taken morning and evening. We have thus sufficient knowledge of the temperature to grasp the indications furnished by it.

The existence of a plateau, that is to say, the persistence of an elevated temperature in the thermometer, constitutes a formal indication for cold baths.

We shall then apply the method when the patient presents morning remissions with a temperature sufficiently above the normal one.

The *rationale* is easy to understand; it is less a passing elevation of temperature that we have to guard against, than the persistence of a high temperature, if we wish to avoid the lesions attributable to hyperæmia.

Now what do we understand by these words: a high temperature? In M. Libermann's opinion, the temperature is high when it reaches 40° in the rectum, or 39° in the arm-pit. In my opinion this limit is a little too low; 30° is a temperature that we habitually observe in epidemics: there are few patients who do not reach it —39° at five o'clock in the evening is even the ordinary figure, and to say that at 39° it is necessary to put those patients into a cold bath, virtually means that Brand's method ought to be applied in every case of typhoid fever.

There is another element which we must take into account. When it becomes necessary to know whether such or such a definite degree of temperature demands a cold bath; that is the date of the commencement of the malady.

Hereafter very delicate difficulties of application present themselves.

According to almost all observers, intervention is useful on the 9th, 10th, and even 12th days, and for more latitude, say the commencement of the second week. If then, the patient comes under our notice in the first days of the second week, we have one or two days for observation, in order to act without rashness.

I give you the practical rules I have adopted.

If on the morning of admission to hospital, the temperature is above 40° and near 41°, and if still more, the patient presents grave symptoms, especially of a nervous type, I do not hesitate in immediately commencing the treatment by cold baths. If the temperature does not pass 40°, or is lower, I wait.

The day of admission has, we all know, a great influence on the temperature of the patient. Generally, he comes on foot for advice, sometimes from a distance; he has to wait a certain time before reception, and the fatigue caused by thus going and coming, are more than sufficient to account for any exaggeration of his feverish state. Often also, a purgative given on the same day is sufficient to lower the temperature to a degree, when there is no urgency for intervention.

The gravity of the prognosis and the necessity of employing cold baths without delay, varies also with the date at which the high temperature comes under our notice.

There is on this subject a very true axiom of Liebermeister, a precarious thermometrical ascent generally heralds a slight or even abortive case; thus a temperature of 40° on the third or fourth day indicates that the fever will not be long in decreasing. Whilst the same temperature has a very different prognostic gravity if the thermometer, towards the seventh day, by a gradual ascent, reaches that point.

It is then about the beginning of the first week that we ought to redouble our attention, for that is the time the course of the malady reveals itself openly, and the thermometrical scale begins to hold out danger signals.

At this epoch I do not hesitate to employ the bath, if for two days running the temperature reaches 40°. I even order it if I find 39·5, or 39·6, and even 39·3, when it occurs in the morning.

These feeble oscillations indicate the existence of a plateau, with still more reason a horizontal line near 40° imperiously demands cold water.

If the fever takes a grave character, there are besides the high temperature other serious complications which strike our attention.

I know well that acting in my way I do not apply Brand's method with strictness, but I confess I am not able to overcome my repugnance to experimentalise in cases which seem to have great chances of spontaneous recovery. Along with the temperature the pulse affords us indications which we must not neglect. Ordinarily they harmonise; but there are cases where this accord ceases to exist, and then we must take into account the number of pulsations.

As a general rule the prognosis becomes serious when the pulse reaches 120° or more.

Of sixty-nine patients of Liebermeister whose pulse reached or passed 120°, forty died.

The number of pulsations may be temporarily increased by a variety of emotions which have no influence on the temperature.

The presence of the physician and his pupils in a great number of cases is sufficient to raise the standard, but remembering this fact we need not be deceived in our prognosis.

Besides the number of beats, the quantity of the pulse, and particularly the dicrotism furnish another indication. Dicrotism is, as you know, an indication of nervous exhaustion, and if it coincides with a high temperature, cold baths are justifiable. To the double indications of the pulse and the temperature I would join another, the importance of which my own practical experience has taught me, and that is, the state of the nervous system.

I have spoken before of the wonderful influence of cold water in delirium. I do not hesitate now to employ it in cases of intense delirium, even when the temperature

is not very high ; and I regret that it was not made use of in the case of W——, as perhaps a fatal termination might thereby have been avoided. In my opinion, these serious nervous symptoms constitute a pressing indication when thermometrical cannot direct us.

Allow me to give an example, it is a very curious case, I observed a day or two ago at the Maison de Santé in the *clinique* of my excellent colleague M. Féréol.

Patient, a young man, who since his admission presented a temperature of 40·5°, indicating the commencement of high temperature. In the absence of grave complications we wait ; suddenly nervous phenomena, violent, furious delirium, extreme excitability requiring the application of the camisale show themselves, whilst at the same time temperature falls to 38°. M. Féréol ordered the cold baths, the delirium, all the cerebral complications rapidly disappear ; and, strange fact, the patient assumes the common adynamic type with the ordinary temperature of 39°, a perfect recovery was the result. This fact has, in my opinion, great weight ; it proves authoritatively that temperature is not everything in typhoid fever, and that serious nervous complications may supervene without the thermometer drawing our attention to them.

These accidents are a formal indication for treatment by cold baths.

Let us now pass on to the contra-indications.

Mr. Brand would make this chapter excessively short. He only allows one contra-indication against his method, and that is perforation of the intestines. You know that this complication rapidly proves fatal. There is often too much cruelty even by the necessary movement of removal inflicted on such unhappy patients who have not many hours to live. This contra-indication is not one, properly speaking, and to pretend that it is the only one is to maintain that it never does exist.

As I think that Brand's method is not applicable without exception, I must reckon a certain number of contra-indications ;—1st. To go from simple to the abstruse there is one non-indication—*i.e.*, a moderate temperature. I never think of placing in a cold bath a patient whose symptoms are in all respects regular, and whose temperature does not pass 30·5. I must also count as a contra-indication. The evil is already done, and cold baths so useful on the tenth day, will not be of much avail on the nineteenth or twentieth. I have tried them three or four times under those conditions, but I have only met with failure. On the contrary, cold lotions employed about the twenty-third day have proved successful with a patient who presented ataxic complications.

Ought menstruation to be regarded as a contra-indication ? Some say yes ; the hydrophs answer no. For my part I shall not vouch for the harmlessness of them. I have seen serious complications consecutive to the employment of cold water during the period of the menses, and if they commence with one of my patients I prefer to wait. If they run a natural course we have only forty-eight hours lost. My treatment is different in the case of certain metrorrhagias which enter into the class of those proper to typhoid fever, and which M. Gubler has classed under the characteristic name of uterine epistaxis. In those cases I see no reason for delaying the administration of the bath.

You may recal to your mind a woman in No. 3 ward, St. Mathilde, who ten days after her menses exhibited slight metrorrhagia. I still continued the baths and she recovered without an accident.

In cases of intestinal hæmorrhage, a slight entarrhagia would not now prevent me from using the baths. I would use applications of ice over the abdomen in the intervals. In hæmorrhage of a grave nature, the continued use of ice has yielded excellent results.

Must we consider diarrhœa a contra-indication ? Currie (I know not why) thinks it one. The epidemic of this year not presenting in general such symptoms, I have not been able to verify his assertion.

Ought we to stop abundant perspiration ? That will depend upon the case. If the fever is mild, the diaphoresis by itself constitutes a sufficient element of refrigeration, and does not require assistance ; if the malady assumes a grave form, I do not consider that perspiration ought to prevent the use of the bath.

We now must consider thoracic complications. These constitute the real touchstone of Brand's method, as it is from their existence the most specious arguments against the system are adduced. Without explaining the nature or prognosis of such cases, I will tell you what I do when I have to deal with them. Suppose we admit into hospital a patient whose thorax is full of sibilant, and even sub-crepitant, *râles*, ought that to prevent us ? No ; we have not to deal in this case with the bronchitis. The phenomena of auscultation depend on the fever itself, as congestion of the spleen and other viscera (so well studied and particularised by Chésteviegne in his thesis), and the cold is nothing. Although cold may be an occasional cause, that does not prove that cold may not be useful in bronchitis already existing. There is a capital difference in all points of view, between accidental humid cold and a refrigerative method followed by reaction, and employed with precaution as a therapeutical agent.

Let us come to the question of facts. Without blaming the conduct of other practitioners who abstain in those cases, the more I see of them the less I am prevented by the presence of these *râles*. Although they were present in the case of No. 34 Ward, St. Landry, I used the cold baths, and was well rewarded. The patient, V. (No. 3 Ward, St. Mathilde) had spat up some strings of blood ; I continued the same treatment, and we had great success. I could mention many more examples.

Many patients cough very much whilst in the bath. This cough is a simple reflex phenomenon, and ceases immediately they are taken out, and does not indicate the commencement of bronchitis.

(*To be continued.*)

Clinical Records.

ST. MARY'S HOSPITAL.

Under the Care of Mr. HAYNES WALTON.

Notes by J. B. COUMBE, M.R.C.S., House-Surgeon.

Farcy—Broncho-Pneumonia—Recovery.

J. G., æt. 48, was admitted Sept. 23rd. A strongly-built man, earning his living in visiting fairs and markets, buying and selling horses of a low class. His calling occasions him to drink very free, and he got drunk about as often as possible. He had syphilis twelve years since, followed by secondary eruptions, his wife, whom he infected, being at present in hospital with syphilitic retinitis. Six days before admission he felt weak, dejected, and incapacitated from following his duties. The following day about fifty bullæ appeared on different parts of his body and limbs ; he gradually felt worse, until he presented himself at the hospital, when he was almost covered with bullæ from one quarter inch to 2 or 3 inches in diameter. He had a slight purulent discharge from the nose ; conjunctivitis, with some chemosis. Cough ; expectoration tinged with blood. Temp. 101 ; pulse 120. He was ordered a mixture of iodide of iron ; brandy, and a liberal nourishing diet.

For four or five days the bullæ increased in size and in numbers ; some of those which were present on admission had become pellucid, others were filled with a dark, bloody fluid, though the majority had burst, leaving superficial ulcerations. The discharge from the nose, eyes, and ears was abundant, purulent, bloody, and very fœtid ; chemosis to such an extent as to threaten sloughing of the cornea. Urgent cough, difficulty of breathing, profuse expectoration of a purulent bloody material, whilst auscultation gave the signs of severe broncho-pneumonia. Temp. 103 ; pulse 132, very feeble. He slept badly ; at times

there was slight muttering, low delirium. He was ordered into the "Isolation Ward," where the windows were kept open, but remained in the same condition about a week, when he began to improve under a mixture of liquid extract of cinchona, brandy, and a liberal fluid diet. The ulcerations as the bullæ burst being dressed with a mixture of lime water, linseed oil, and hydrocyanic acid, over which was laid a thick layer of cotton wool. He now rapidly improved; no more bullæ appeared. The cough, discharge from the nose, &c., gradually subsiding. At the end of three weeks he was sufficiently well to join the other convalescent patients, and was discharged cured on the 3rd of November.

The nurse, a strong, healthy woman, became ill, having a severe ulcerated throat whilst attending this patient in the "Isolation Ward."

Students' Column.

LECTURES ON HUMAN ANATONY—DESCRIPTIVE AND SURGICAL.

By WALTER RIVINGTON, M.S. Lond., F.R.C.S. Eng.,
Surgeon to the London Hospital, and Lecturer on Anatomy at the London Hospital Medical College.

LECTURE XII.

Composition of the Skull; Architectural plan of the Skull; Study of Sections.—Of the three bony capsules connected with and supported by the spinal column, the *Skull* is by far the most complicated and difficult for the student to master. Its offices are so numerous, it relations are so varied and minute with the vessels and nerves which pass through its fissures and foramina on their way to or from the brain, with the brain itself and its membranes, with the muscles attached to it, and with the organs of special sense which it encapsules and protects, that the work of many months would not be more than sufficient adequately to expound it and the structures with which it is connected. Nevertheless, the exposition of its anatomy and connections with muscles, vessels, nerves, sense organs, and brain, has to be compressed into a space of time which is entirely inadequate to do justice to the subject. Composed of 22 bones, it forms first of all a bony case to cover and shield the brain; secondly, a firm framework for supporting the soft parts which constitute the face an ever-varying index of the mind within, together with those accessory structures without which the "human face divine" would scarcely prove an agreeable object of contemplation; and thirdly, it furnishes capsules for the lodgment of the organs of sight, hearing, smell, and taste, which minister to man's necessities, preservation and enjoyment and canals for the passage of the food to the stomach and air to the lungs, without which life could not be maintained. On each of the accessory parts found in the skull, the organ of hearing, lodged in a chamber hewn out of the densest bone in the body—or as Holden is pleased to term it, the solid rock—the orbit with that most perfect of optical instruments which it encloses; the nasal chambers performing the threefold office of an olfactory vocal and respiratory organ; the mouth, at once "the minister and interpreter of nature," guarded by the upper and lower jaws bristling with teeth, a separate volume might be written. It is the lecturer's unenviable task to condense volumes into chapters, that he who runs may read. The bones of the skull will be best described by adopting the ordinary division into bones of the Cranium or Skull proper, and the bones of the Face. The Bones of the Cranium or brain case are eight in number: OCCIPITAL; 2 PARIETAL; FRONTAL; 2 TEMPORAL; SPHENOID and ETHMOID. The bones of the face are fourteen: two SUPERIOR MAXILLARY or UPPER JAW bones, one INFERIOR MAXILLARY or LOWER JAW bone, two PALATE BONES, two NASAL BONES, two MALAR or JUGAL or CHEEK BONES, two LACHRYMAL or TEAR BONES, two INFERIOR TURBINATED or SPONGY BONES, one VOMER or SHARE BONE.

In this specimen the bones are mounted together and in relative position, but at a little distance apart, and you may observe the general arrangement. There are the single bones which occupy a median position. Beginning from behind, and proceeding forwards, we have the OCCIPITAL forming part of the skull posteriorly and inferiorly and distinguished by the great hole, or *foramen magnum*, which pierces it; then the SPHENOID, reaching right across from one side of the skull to the other, and constituting with the occipital, in the adult, but a single bone; the SPHENO-OCCIPITAL in front of the sphenoid, the ETHMOID or olfactory bone, and the thin elongated VOMER. All the other bones are arranged in pairs at the sides of these central bones. Here are 2 PARIETAL, so called because they form *paries*, a wall to the brain on the right hand and on the left. Here are the two TEMPORAL bones, distinguished by the external passage of the ear, by the zygoma, and the auditory capsule jutting into the skull; wedged in between the occipital, the sphenoid, and the parietal, and called temporal because the hair over them or near them first displays the ravages of time. Here is the FRONTAL, a single bone, apparently and an exception, you will say, to the division just made. Not so: for if you look at the bone at birth, it is not one bone but two, each half protecting its own half of the brain, and forming its own half of the brow or forehead, and constituting therefore an OS FRONTIS or FRONTAL BONE. In the face, again, the bones are arranged with great regularity in pairs flanking the central perpendicular plate of the *Ethmoid* and the *Vomer*. Here are the 2 little NASAL BONES, forming the bridge of the nose; here the important SUPERIOR MAXILLARY BONES, contributing to the cavities of the orbit, nose, and mouth, and bearing the upper set of teeth; and there behind them, entering into the same 3 cavities are the 2 PALATE BONES. Inside, the nose hangs on each side from the upper jaw-bone, the INFERIOR TURBINATED, and in this corner of the orbit, between the *ethmoid* and *superior maxillary* is a little ossicle, the LACHRYMAL BONE, grooved by the special canal for the descending tears. Suspended from the cranium is the horseshoe-like LOWER JAW BONE, at birth consisting of two distinct halves, and therefore to be regarded rather as a pair of bones than a single bone; and lastly, symmetrically placed on either side connecting the cranium and face, are the malar bones, termed from this function of theirs the JUGAL BONES.

At first sight you might suppose that the bones of the skull were arranged in an intricate and an incomprehensible manner, but it is not so. They are disposed on a definite plan in admirable order, and with the utmost regularity and design. Fully to comprehend the architectural plan, the method advised by Professor Huxley must be adopted, of making and studying antero-posterior and transverse vertical sections, which bear a definite relation to the principal axes of the skull. A vertical transverse section, or as Continental anatomists call it, a "frontal" section of the skull through both external auditory passages, divides the skull into two unequal portions, anterior and posterior. This skull, the skull of a New Zealander, has been thus treated; and you will see in each half, a central part or floor, and springing from this floor arches which meet above to form the roof of the skull and enclose the brain. In the anterior half, we have a stout median floor interposed between the bones of the cranium and the bones of the face. The bones of the cranium pass outwards and bend upwards in a curvilinear manner, to complete a chamber for lodging the brain; whilst the bones of the face descend to form lower arches, and enclose the chambers of the nose and mouth. These two cavities lie one above the other, the nasal cavity above, and the oral cavity below, separated by a bony partition prolonged inwards from the palate and superior maxillary bones. Observe that the upper nasal chambers are smaller than the lower oral chamber, that they are divided into two passages by the *vomer* and *perpendicular plate of the ethmoid*, descending from the roof to the middle of the palatine arch, and that they are flanked at the back by the processes which project from the under surface of the *sphenoid* called the *pterygoid processes*. In the posterior half of the skull, you see the stout median floor, formed by the *basilar process of the occipital bone* in front of the *foramen magnum*; whilst the upper arches are composed of the *parietal* and *temporal* in part, and the expanded portion of the *occipital*. In this section there are no lower arches. Suspended, however, from these long processes, the *styloid processes* of the *temporal* bone, by ligament sometimes converted into bone, as in the specimen on the table is the small HYOID or U SHAPED BONE which lies in the neck behind and below the lower jaw, surrounding the passage for the admission of air to the lungs. The *hyoid bone* is regarded as the lower arch to the posterior segment of the skull. The essential composition of the skull, then, is that of the rest of the trunk skeleton. Make a section of the thorax of a

man placed in the horizontal position of a four-footed animal, and what do you see? Two canals separated by a median solid partition, the vertebral column. The upper small canal is the spinal canal, the lower large canal, the cavity of the thorax. The upper arches formed by the pedicles and the laminæ of the vertebræ are of small size, because the central nervous system is here a slender cylinder; the lower arches formed by the ribs, costal cartilages, and sternum are large, because they have to envelop and protect the heart and lungs. In the skull, the proportions of the two arches are exactly reversed. The central nervous system, the organ of intelligence, emotion, associated automatic and reflex actions and will, is enormously increased in size, and requires a large chamber. Hence the expansion of the upper dorsal or neural arches. The lower chambers, ministering to the life of the animal in man are comparatively small, and therefore the lower arches are correspondingly reduced. In man, the intellect was designed to predominate over the instruments of sense; the mind is intended to control the emotional impulses which are caused by strong impressions upon the nerves distributed to the tactile, gustatory, olfactory, auditory, and visual organs. In brutes, in a state of nature, these impulses govern the movements, and sway all the actions of the living organism.

Before studying an antero-posterior vertical section of the skull, you should become acquainted with the general features of each of the bones of the skull, and the parts of which they consist. This will be best accomplished by comparing the adult bones with the fœtal bones at birth. Take first the OCCIPITAL bone. The fully developed Occipital bears a remarkable resemblance to a vertebra. It is placed immediately over the atlas with which it articulates, and is the medium by which the skull is supported on the spinal column, and the weight of the skull transmitted to it. It is perforated by this great aperture, the *foramen magnum*, which transmits the continuation of the spinal marrow, and corresponds with the foramen of the vertebræ. In front of the foramen is the part which corresponds with the *body* of the vertebra—the *basilar process*. The margins of the *foramen magnum* constitute the *arch* composed of the *pedicles* and *laminæ*. The posterior expanded portions of the bone, or *squama occipitus*, may be regarded as an expansion of the *laminæ*, the *spinous process* being represented by this projection on the outer surface called the *external occipital protuberance*, together with the ridge running down from it to the foramen magnum, or *external occipital crest* (*a*). Of the *articular processes* only the *inferior* are present, and these are at once recognised in the convex eminences which flank the foramen magnum. Passing through the bone above the condyle on each side is a *foramen* called the *anterior condyloid*, which transmits the twelfth cranial nerve, or hypoglossal. Outside this part of the bone is a large notch, completed by the temporal bone into a foramen called the *foramen lacerum posticum basis cranii*, which transmits, in addition to large blood-vessels, the 9th, 10th, and 11th pairs of cranial nerves. These foramina, the *anterior condyloid* and the *posterior lacerated foramen*, may together be taken to represent the inter-vertebral foramina of the spinal column. When the anterior condyloid foramen is present it pierces the boundary of the foramen magnum, but in fishes the hypoglossal nerve is absent, and then the bone is pierced by the nerves which, in man, pass through the large lacerated hole. In the child at birth we see that the occipital bone is in four distinct segments. The *basilar process* is a separate bone, and is called the *basi-occipital*. The part of the occipital which bounds the foramen magnum laterally, and is perforated by the condyloid foramen, is a separate bone on each side, and takes the name of *ex-occipital*. It bears on its under surface the main portion of the occipital condyle. The curved expanded plate behind the foramen magnum, the *squama*, is termed the *supra-occipital*, so that the occipital bone consists of four pieces—a body or *basi-occipital*, two *ex-occipitals*, and a *supra-occipital*. These terms should be remembered, and not only remembered, but generally employed in our anatomical text-books, because these segments are represented through the vertebrate series, and described under these designations. Human anatomy should be taught at our schools under three aspects—a less important aspect, which looks towards comparative anatomy, and more important aspects, which look towards physiology and the practice of medicine and surgery. By looking at anatomical structures in relation to coresponding structures in lower animals we gain breadth of view, and open up sources for philosophical reflection, and, perhaps, scientific study hereafter; by looking at anatomy in relation to physiology, we divest the study of anatomy of its dry technicalities, and exercise intelligence for the relief of memory; by looking at anatomy in relation to medicine and surgery we help to place the art of the medical practitioner on a firm and solid basis, and we prove the necessity for all—yes, and more than all—the devotion which medical students at present are required to give to the details of anatomy, which, without a practical bearing, would indeed be weary, stale, flat, and unprofitable.

(*a*) The Supra-occipital is generally regarded as the expanded neural spine, and the exoccipitals as the neural arches combining the pedicles and laminæ, the arch having to be completed by the neural spine. The point is of no great importance.

Transactions of Societies.

SURGICAL SOCIETY OF IRELAND.

THE Third Meeting of the Session of this Society was held on Friday, January 7th, 1877.

In the absence of the President and Vice-President, the chair was occupied by Professor STOKES, Senior Member of the Council present, and then by Mr. HENRY TYRRELL.

Mr. TYRRELL having taken the chair,

Mr. STOKES'S paper on the

EXTENSION SPLINT FOR FRACTURES AND CERTAIN DEFORMITIES OF THE LOWER EXTREMITY

was read, and will be found on page 101. In the debate which followed,

The CHAIRMAN said he did not quite agree with Mr. Stokes regarding the great inconvenience experienced by patients whose limbs are put up after Liston's method, nor after the method which Mr. Hughes adopted in Jervis Street Hospital. There was a slot in the foot-rail of the bed in which the splint lies, by which means all pressure on the heel was effectually prevented, and the patient was enabled to move about in the bed. He (Mr. Tyrrell) knew that when he was at that hospital very frequently they were not obliged to take down the fracture at all, and the patients certainly made very excellent recoveries. The question as to whether there was actual shortening of the limb or not was a difficult one to decide. Mr. Hamilton, of America, had said that it was very difficult to measure whether there was a quarter of an inch of shortening or not in such cases, particularly if the measurements were not made with the greatest accuracy. He would like to know, therefore, from Mr. Stokes how he made his measurements, and as regarded the patients, if they recovered from the imperceptible obliquity which would occur, so that in practice there would be apparently no shortening, although in reality there was. Of course he did not say that there was any actual shortening. On the other hand, he did not think they would often have to complain of lengthening in fractures of the femur. Mr. Butcher had written ably on the subject, and stated positively cases in which he had no shortening with his splint, so that there were points which it would be well to clear up. He (Mr. Tyrrell) fully appreciated the advantage of the double screw, by which they had the extending and counter-extending force carried on to any extent they might require. Mr. Butcher in his paper had drawn particular attention to the advantages which his splint possesses over that of Mr. Liston's, and they knew that Mr. Richardson had devised an excellent splint. Indeed, it seems to be one of the things in which surgeons rather delighted in. Then there was the ordinary plaister splint, and the Bavarian splint, and in cases of young people many had, he believed, attained excellent results without the use of a splint at all. In Bartholomew's Hospital they suspended the limb from the ceiling, so that they kept up an effectual extension of the limb.

Mr. RICHARDSON said the splint he had described was a modification of one of the American splints, and the extension was carried on somewhat on the same principle as in Mr. Stokes's apparatus. The adhesive plaister was applied to the limb, as in Mr. Stokes's apparatus, which was the method practised for some years by certain American surgeons. There was one point to which he desired to refer. Mr. Stokes had spoken of the value of extending and counter-extending at the same moment. He (Mr. Richardson) wished to observe that

that was the principle of the glossocomium of Galen, one of the very oldest principles that had been applied to splints for fractures. He need scarcely remark at the same time that Mr. Stokes's apparatus was a most ingenious one, while Galen's was a most clumsy invention, but still the principle in both was the same.

Dr. THORNLEY STOKER, as one of Mr. Stokes's colleagues, who had had an opportunity of observing the use of Mr. Stokes's splint, thought it right that he should endorse the statements he had made with regard to the results obtained during the period it had been in use. He had seen it used in a considerable number of cases, and he must say that he valued the splint as highly as Mr. Stokes did. There was no advantage that he had claimed for it that it did not possess. Any one who had practically treated these fractures in children would have found difficulty in keeping an apparatus in position for any length of time. This splint possessed that advantage to a considerable extent. He believed that in every one of these cases occurring in children there was some degree of shortening, and, even after the most careful treatment, they had some angular deformity. Amongst the few cases of fractures and some other cases treated by that apparatus, he had made some careful measurements, and he could endorse what Mr. Stokes had said—that they were at some loss to know whether there was not some lengthening present, and, although that might seem a ridiculous statement, it was really an advantage, because in the great majority of cases shortening was the rule, while this apparatus would enable them to obtain lengthening, and, of course, if care be exercised, the limb will be restored only to its proper length. None of the measurements, he might state, were made from the umbilicus. They were made in several ways—from the anterior superior spinous process of the ilium in the first place to the top of the patella, then from the anterior superior spinous process to the inner malleolus, from the top of the trochanter to the top of the patella and the inner malleolus. Certainly there was no shortening, and possibly there was a little lengthening in the cases referred to.

Dr. BARTON thought the principle of Mr. Stokes's splint was the point that they ought if possible to attend to more than anything else, inasmuch as that principle was common to many other apparatus. He thought the principle was a very correct one, and that was, that the extending power was made by screw force, and one, which acting steadily and gradually, could be kept up to almost any extent. The counter-extending force is against the perinæum, and that without a band. He was sure the apparatus answered very well on account of that principle being carried out in it, but in fractures undoubtedly in many cases, particularly in children, it would be of great importance to have the simplest possible apparatus applied. They were accustomed, he thought, to carry out that same principle in other ways. The screw splint of Mr. Richardson answered the same purpose in almost precisely the same manner; and in another, the way the weight is applied in America answered also remarkably well. By the last-named means they could almost dispense with the splint, or use sand-bags, or a slight splint held but lightly round the limb, and he had seen that answer remarkably well. With regard to the amount of shortening, they might all, he thought, be satisfied if they turned out cases that compared favourably with the sound limb, and with which the patient could walk without limping. He did not believe in the absolute accuracy of measurement, and would not be satisfied to take such as certain unless there had been *post-mortem* measurements of the bone. He thought that in an ordinary practical way they might arrive at a general conclusion that a case was turned out very well indeed without laying it down as a fact which they might depend upon afterwards that there was no shortening.

MR. STOKES, in reply, said that with regard to Liston's splint, he regretted that he must join issue with the chairman when he said that they did not require to reapply that splint very frequently. That had not been his (Mr. Stokes's) experience, or the experience of his colleagues. He thought there was no appliance, if they wished to keep a fracture in proper apposition, that they had not to watch it closely every day or change it twice or three times every week. No matter what care was taken, the oblique bandages would always get more or less loosened, and become relaxed. As regarded the measurements, he thought his friend and colleague, Dr. Thornley Stoker, had answered that question very fully. He had mentioned that the measurements were not taken from the umbilicus. They were taken at the points already indicated with a very accurate measuring tape. There was no difference of opinion except in one of the cases to which he had already alluded. He could not either, he was sorry to say, agree with the Chairman as to their being no necessity for applying any apparatus to a young person when the femur was broken. He (Mr. Stokes) had seen unfortunate results in several places where that plan was more or less adopted, and in reference to this he must say that the plan which Dr. Barton seemed to have approved of was one of those from the use of which he (Mr. Stokes) had seen most unfortunate results follow—namely, Gordon Buck's plan of the weight on the inclined plane, the counter-extending force being supplied by the weight of the patient. He had seen bad results following the adoption of that plan both in cases of young persons as well as adults. It was quite unknown to him that the principle of this splint had been advocated by Galen.

Mr. RICHARDSON made a communication to the Society on

EPULIS.

He said that during last spring a boy was admitted into the Adelaide Hospital with a small epulis, which apparently sprang from the gum, between the outer lower incisor tooth and the canine tooth. The epulis was about the size of a pea, and illustrated the truth of an observation made by the Vice-President of the College at the last meeting of the Society, as to the great value of the freezing microtome; for although the epulis was so small, he (Mr. Richardson) was able by freezing it, to make about 18 sections from half of this very small structure. It was a very good specimen of fibroma. The sections under the microscopes were remarkably interesting with regard to the fixed connective tissue corpuscles. For instance, in the section under one of the microscopes, these corpuscles were in dense tissue, and assumed a fusiform shape; whereas the sections under the other microscope, they were in soft tissue, and assumed a stellate form. The sections had a deceptive carcinomatous alveolar appearance, which was owing to their extreme tenuity. After he had made the sections, he looked at them before they were placed in glycerine, and he saw in one two very large giant cells, but he never could find them afterwards, as they evidently dropped out of the alveoli. In the operation he performed for the removal of the epulis, he cut away the sockets of the canine and outer incisor tooth. He was happy to say that there was no appearance of repullulation of the disease, the boy being in perfect health.

The Society then adjourned.

DUBLIN OBSTETRICAL SOCIETY.

THE Third Meeting of the Session was held on Saturday, January 13th, the President (Dr. DARBY) in the chair.

DR. MARION SIMS.

Dr. KIDD (President of the Royal College of Surgeons) said, before the society proceeded to the ordinary business, he begged leave to propose an honorary member; and as this was the first time that any honorary member had been proposed since the society had adopted its new bye-laws in 1862, he felt it incumbent on him to make a short statement, to justify him in moving the election of the gentleman he was about to propose. When the society adopted its new code of bye-laws in 1862, it was determined to make the honorary membership a mark of distinction and one that might justly be considered an honour of great value; and with this view three rules were made—the first instituting honorary memberships, the second prescribing that such members should be proposed at one meeting and balloted for at the following (one black bean in six to exclude), and the third limiting the number of honorary members to twelve. There are now on the list but ten honorary members; and he (Dr. Kidd) believed, in proposing that Dr. Marion Sims should be elected to one of the vacancies, he was strictly carrying out the views of the society and proposing one who was in the highest degree worthy of the honour. Dr. Marion Sims has long held a prominent position in obstetric surgery. By his invention of the duckbill speculum he laid open to us a whole field of surgery, the extent of which was not yet fully known. Next to the uterine sound, for which we are indebted to one of our late honorary members—Sir James Simpson—he (Dr. Kidd) believed no instrument had ever been devised that did so much for uterine surgery as the duckbill speculum; for by it we were for the first time enabled to see, and, at the same time, touch the uterus and whole extent of the vagina. It is

true the discovery has been claimed for another, but Dr. Marion Sims' claims to it are, in his (Dr. Kidd's) opinion, indisputable. In addition to the devising of a speculum, to enable us to get at the uterus and vagina for the performance of operations, Dr. Sims, if he did not actually introduce the use of metallic sutures, was mainly instrumental in the introduction of their use, and thereby (in the words of Simpson) "led the way in this modern revolution in the treatment of vesico-vaginal fistulæ." If Sir James Simpson laid the foundation of almost all our recent advances in the diagnosis and knowledge of uterine disease by the discovery of the uterine sound, Dr. Sims has, in like manner, laid the foundation of our advances in the treatment of uterine and vaginal disease, by teaching us the use of the duckbill speculum and metallic sutures. He (Dr. Kidd) believed these were sufficient grounds to justify his proposing that Dr. Sims should be elected an honorary member of the society; but in addition, Dr. Marion Sims had given us a work on uterine surgery which established a new era in this branch of our art—a work of great merit, throwing new light on many points of uterine pathology, and suggesting methods of treatment that have been found most beneficial, and operations that captivate by their ingenuity, dazzle by their boldness, and enforce their adoption by their success. To those who knew Dr. Sims personally it was not necessary, Dr. Kidd said, for him to speak of his personal claims—an enthusiastic lover of his profession, a dexterous operator, a leader in obstetric surgery, upright, and honourable; in electing him we shall confer an honour on ourselves. I move, sir, that Dr. Marion Sims be elected an Honorary Member of the Dublin Obstetrical Society.

Dr. LOMBE ATTHILL (Master of the Rotundo Lying-in Hospital) said it afforded him great pleasure to second the nomination of Dr. Marion Sims as an honorary member of this society. Dr. Sims was so well-known, and his character had been so accurately described as an obstretric surgeon by Dr. Kidd, that he (Dr. Atthill) had nothing to add. He had had the pleasure of Dr. Marion Sims' acquaintance, and he could say of him that—in addition to being an accomplished and talented obstetric surgeon—he was a gentleman in the truest sense of the word.

Dr. M'CLINTOCK considered it hardly necessary for him to say a word in addition to what had already been spoken by Dr. Kidd of Dr. Marion Sims. He (Dr. M'Clintock) could not, however, remain silent on an occasion such as that when Dr. Sims' name came before them. He was a guest of his in the year 1860, when he (Dr. M'Clintock) was Master of the Rotundo Hospital, and he must say that he derived as much pleasure and instruction on all occasions from his conversation as they had derived instruction and gratification from his works—a circumstance that did not always occur in the cases of authors and their works. Although Dr. Marion Sims had not for many years—and he (Dr. M'Clintock) was rather doubtful as to whether he ever did—practised midwifery, yet, as a gynæcologic obstetric surgeon, he held a position that was not surpassed by any other man. The boldness and originality of his operations upon the uterus were really surprising, and displayed a vast resource of mind. He had extraordinary manual skill, his dexterity as an operator was wonderful, and to see the use he had of his fingers was surprising. When Dr. Marion Sims came to this country, he (Dr. M'Clintock) did a thing that probably would not be approved of in a general way—and that was to allow a strange surgeon, and a visitor to the country, to perform an operation in one's own hospital and upon one's own patients; and that was what he did with regard to Dr. Sims, so high was the character he bore when he came over to Ireland. A great many members of the profession wanted to see Dr. Sims operate in vesico-vaginal fistula—an operation in which he had made vast improvements, and one which had done more to spread his fame than anything else, excepting, perhaps, his use of the silver sutures. He (Dr. M'Clintock) was also anxious to see Dr. Sims operate, but he (the speaker) was at a loss to know whether he would be sacrificing his position as surgeon to a public hospital by so doing. He, therefore, consulted the late Mr. Cusack, a very able adviser, and one who always had the dignity and independence of the profession at heart; and he said that to allow Dr. Sims to operate would be a justifiable course, and his (Mr. Cusack's) reason for giving that advice was, that the superiority Dr. Sims had acquired in this operation did not depend upon any anatomical knowledge on the subject or upon any ordinary surgical knowledge, but it depended on acquired manual dexterity; and he, therefore, considered that he (Dr. M'Clintock) would not be sacrificing his position in any way by allowing Dr. Sims to operate in the Rotundo. He, accordingly, permitted Dr. Sims to operate, and, fortunately, there were two suitable cases in the hospital at the time. The first operation was a mere pinhole fistula (a kind of fistula that, under the old mode of operating was generally not very difficult), and the result was most successful. The next was a most difficult case, for there was a fistula nearly as large as half-a-crown. Dr. Sims spent nearly two hours over that operation, and put about nine stitches. He was so exhausted at the conclusion of that operation, that he had to lie down on a sofa. He certainly did not spare himself on that occasion, but the operation completely failed. It was superfluous for him to say a word in Dr. Sims' praise, for nothing that could be said could add to his eminence. He believed that Dr. Sims was in every way most eminently deserving of this or any other honour the society could confer upon him. (Applause.)

UTERINE POLYPUS.

Dr. LOMBE ATTHILL exhibited two specimens of uterine polypi, both of which had been removed from unmarried women. In one of the cases, the os externum was so small that he had to introduce one of Barnes' bags, when he recollected that he had a modification of an écraseur (which he had invented and exhibited to the society eight years ago), by which he could use the canula of Gooch. He accordingly brought that modification into use in this case, and operated most successfully, and the patient made a rapid recovery. In that case there was very little violence used, and yet she had a sharp attack of pelvic hæmorrhage. He merely mentioned that circumstance now in order that he might advert to the fact that there had been, in the Rotundo Hospital of late a regular epidemic of cellulitis. Within the past month there had been five or six cases of cellulitis. The other polypus was somewhat larger; it sprung from the cervix, and projected into the vagina. It was removed with ease, and the only inconvenience it caused the patient before removal was that it gave rise to profuse leucorrhœa.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
,, IF PAID IN ADVANCE 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.C.
A. H. JACOB, 23 Ely Place, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, FEBRUARY 7, 1877.

THE PRESIDENCY OF THE IRISH COLLEGE OF SURGEONS.

THE approach of the general meeting of the Fellows of the College, which takes place on the last Monday in May, and of the elections of President, Vice-President,

and Council, which will be held on the first Monday in June, have given rise to an agitation which is likely to bear speedy fruit in the form of a special general meeting of the College, for which, we understand, a requisition to the President is in course of signature. The object of this movement is to obtain from the Fellows an expression of their opinion that the Presidency of the College ought to be held for two years and not for one as hitherto, it being, we presume, understood that the Vice-Presidency shall continue to be an annual office. An object such as this is of serious import to the College and to the majority of its Fellows, and demands careful discussion before the vote is recorded in its favour. In *limine* we may observe that the jurisdiction of the Fellows upon the matter is very limited indeed, and it seems to us more than doubtful whether anything can be gained by the expression of opinion which the requisitionists desire to obtain, even if that opinion should be in accordance with their views. By the terms of the supplemental charter of the College such a meeting can only be called upon the request of twelve Fellows, of whom, it is currently stated, only four are as yet forthcoming. If, however, the requisition should be fully signed, the charter gives power "to such of the Fellows as may attend thereat to deliberate and consult about the state and government of the said College and the administration of the affairs thereof, and they shall be at liberty to recommend to the consideration of the Council of the said College such matters as, to the said Fellows so assembled, shall seem expedient."

If the College at large should recommend to the Council the object of the requisitionists, then the Council has discretion to act upon the requisition or to decline to do so as it has done on former occasions. If, however, a majority of the Council should entertain the same view as the Fellows, then the most serious difficulty will arise in, what we take to be, a decisive legal impediment to the enactment of a two-year Presidency. The clauses of the supplemental charter which define the powers of the Council in this matter are the 4th, 9th, and the 12th, the essential parts of which are as follows :—

"It shall be lawful for the Fellows of the said College from time to time to choose by ballot one person from amongst themselves to be President and one other person from amongst themselves to be a Vice-President, and any number of persons from amongst themselves, and not exceeding the number of twenty-one, including the said President and Vice-President, to be the Council of the said College, the said President, Vice-President, and other members of the said Council to be continued in the said respective offices for such time as is *hereinafter set forth*."

The 9th clause provides for the election of a first Council. It groups together again the President, Vice-President, and Council, and defines that they "shall thenceforth so continue until the election and appointment of their successors *in manner hereinafter provided*."

The 12th clause says—

"And the said Fellows . . . shall then and there elect *yearly* by ballot, out of their own body . . . one person to be President, and one other person to be Vice-President, and any number of persons from amongst themselves and not exceeding the number of twenty-one . . . to be members of the Council of the said College *for the then succeeding year*, which persons so elected shall respectively serve in the offices to which they shall be so elected *for and during one whole year*, and thenceforth until others shall be duly elected *in their places respectively*."

The italicised passages in this last extract constitute the "hereinafter" referred to in the former clauses, and they do not admit of doubt that the intention of the Charter, if not its legal interpretation, is distinctly averse to the proposal for a two-year presidency. By the Charter the President, Vice-President and Council are to be elected at the same time and for the same period of office, and it would be manifestly *ultra vires* in a legal sense to extend the tenure of any one of these offices. Those who advocate biennial Presidency must, therefore, we suppose, be prepared to avow that their proposal is not in accordance with the intention of the Charter. They must know that no resolution of the College or of its Council could debar Fellows from offering themselves for election to the Presidency each year, and no doubt they anticipate that the expression of opinion on the part of the electors which they wish to elicit, would practically prohibit annual candidature, inasmuch as no Fellow acting in contravention of it would have a chance of success. But they must recollect that unsuccess would not prevent a disappointed candidate from applying to the Queen's Bench for a *quo warranto* to unseat the re-elected President, a position in which we suggest neither the College nor its President ought to be placed.

But upon broader than legal grounds we object to the proposal. The constituency of Fellows of the College is already barely adequate to supply it with men deserving of the honour of the chair, and the responsibilities and expenses of the position have recently so much increased, that even those worthy of its occupancy have shown an indisposition to accept the distinction. Do the requisitionists hope to meet this difficulty by doubling the tenure of office, the money outlay, and the sacrifice of time? And if it be their idea to restrict the Presidency to a few of the *élite* of surgery in Ireland, have they any reason to believe that Fellows in large and lucrative practice, who need no *vis inertiæ* to help them forward in public estimation, will sacrifice two years of such continuous attention and labour as the Presidency involves for the sake of the honour of the College Chair? In such a matter as this we naturally look for an encouraging precedent, and we fail to find one at all applicable to the case of the Irish College of Surgeons. In the College of Physicians, it is true, the presidency is held for successive years, but it is so held because the whole body of eligible candidates numbers less than 60, and from so small a constituency it would be difficult to make a yearly selection. But neither in the College of Surgeons itself, since its formation, nor in the surgical corporations of England or Scotland has a President ever been elected for a second successive year. Moreover, the effect of such a decree would be to shut out for ever the provincial fellows of the college from its dignities, for no extra-metropolitan member of the college could be expected to surrender practice to the extent that a two years' presidency would require,

and neglect of the office and its duties would be the inevitable result of placing them in such a position.

Finally, we deprecate the agitation of the question at this particular moment, because already the candidature of fellows for the Vice-Presidency of 1877 and 1878 has been announced, and the effect, though possibly not the object, of the movement would be to prevent their advancement, and to cast a public slight upon them. If the question is to be raised at all—and we have given our reasons to the contrary—it should be raised at a time when personal interests, neither of those who are pushed forward or of those who are held back, would be present to encumber the consideration of it, and the Fellows, if now called upon to debate the matter, ought not to forget its personal as well as its public aspects.

ERYSIPELAS AFTER VACCINATION.

It can easily be imagined what surprise was created by the report that in a certain district of Lincolnshire vaccination had been followed in a great many cases by erysipelas, several of which proved fatal. Nor can we wonder that under the circumstances, and considering the great prejudice in many places against this operation, that the Local Government Board appointed a commission of inquiry into the truth of the above report and the events which led to it. The investigation was conducted by Mr. J. Netten Radcliffe, whose able inquiries into subjects of a like nature we have more than once had occasion to notice. Mr. Radcliffe has recently issued his official report, and we are glad to see that his investigations show that the alarm occasioned by the events about to be described was more than was warranted by the real state of the case.

It must be allowed that the circumstantial evidence in favour of the opinion that erysipelas had occurred after vaccination to such an extent as to almost give rise to a small epidemic, was very strong, and quite enough to influence the minds of people biassed by preconceived opinions and prejudiced against vaccination altogether.

All the cases which occurred in the Misterton district of the Gainsborough Union were among children who had been vaccinated by the public vaccinator for that district. The cases were vaccinated from lymph taken from a child named Walter Burdon, and the vaccination of this child had been the only successful one out of five cases vaccinated from the same lymph. It was the vaccinator's habit to use but one "point" when he vaccinates, and probably about sixteen vaccinations were performed with points charged with lymph from Burdon. We must remark, however, that this Burdon was found to be a healthy looking and lively child, and repeated examinations could not detect any indications of disordered health. Now, of the sixteen children vaccinated from this child ten were attacked with erysipelas, and of these ten cases as many as six proved fatal. Moreover, in a second series of thirteen children vaccinated during October and November, 1876, with lymph other than that taken from Walter Burdon, three were affected with erysipelas, while one had excessive enlargement of axillary glands, and another an axillary abscess. It was also noticed that the greater number of cases of erysipelas in the Burdon eries appear to have a marked relation to the larger proportion of instances in that series in which the pocks healed sluggishly and formed open sores. In one case the progress of the pustules was "spurious and unhealthy throughout," in another the suppuration continued after separation of the scab, and in a third the vesicles were not quite healed on the 27th day of vaccination. These and other facts were certainly of a suspicious nature, and as Mr. Netten Radcliffe admits, strongly tended to the inference that something in the mode of performing the vaccination had contributed to, if not actually determined, the subsequent erysipelas.

When, however, all the circumstances of the case were closely inquired into and thoroughly sifted, most of the facts above mentioned lost the dreadful significance with which they had been invested. In the first place the supposition that the lymph, during its manipulation by the vaccinator, could have received any infection of erysipelas, is rendered unlikely by the fact that he had not previous to the first outbreak of the disease come into contact with any case of erysipelas. It also appears that at the beginning of this outbreak of erysipelas among recently vaccinated children, the disease was not limited to those children; and that in the vaccinated child first affected, the seizure followed close upon the occurrence of a severe case of phlegmonous erysipelas in another part of the same district. There existed, moreover, in the district a peculiar tendency to the spread of erysipelas, such as is sometimes met with as existing in localities quite apart from any performance of vaccination. Lastly, the period after vaccination at which that disease set in, appears to be inconsistent with their having originated at the time of the performance of the vaccination "from any introduction either of erysipelatous, or of active septic, or decomposing matter." Generally speaking, as Mr. Radcliffe remarks, when erysipelas after vaccination has been the direct result of the inoculation of septic material, the symptoms have manifested themselves either immediately or within a day or two of the performance of the operation. But in the worst of the two series of cases above referred to, five complete days was the shortest time that elapsed before the appearance of the erysipelas, and that in one case only, while in all the other cases the interval amounted to at least a week. In seven of the cases the interval varied from eleven to twenty-nine days, and in one instance the interval was as much as forty-six days. Nevertheless, in the opinion of Mr. Netten Radcliffe, certain details connected with the vaccination as performed by the public vaccinator, "probably exercised an important indirect effect in rendering the vaccinated children liable to erysipelas, by causing the progress of the vaccination in several instances to become irregular in some of its stages."

We have already mentioned some of these irregularities and it is the opinion of Mr. Radcliffe, that the unhealed pocks, forming for the most part open sores, afforded facilities for the reception of the infection of such erysipelas as was current in the neighbourhood.

At all events, the facts that have been brought to light by this able investigation convey more than one important lesson, and we are sorry to find that much harm may be

done, and vaccination itself brought into great discredit, through the negligence of our public vaccinators. In this instance we are told that the vaccination was "reprehensibly careless." Some of the lancets used are stated to have been rusty, while others were "dirty, both blades and handles, and in a state unfit for the performance of vaccination." Moreover, "some points" which were produced for examination can only be described as "filthy." We hope, however, that this is quite an exceptional case, and that the office of public vaccinator is placed in hands that are alive to the duty they are under both to the Government and the public. Nor can it be said that this small outbreak of erysipelas, even were it shown to be a direct effect of the vaccination, which, however, is certainly not the case, should in the least shake the confidence of the public in this operation. No doubt the anti-vaccinators may put a very different construction upon this report to what we have done. But the most and the worst they can make of it would only show that vaccination may, under certain exceptional circumstances, be attended or followed by serious or even fatal consequences the very exceptional occurrence of which is shown by the great rarity and almost singularity of this outbreak by the great surprise and alarm it has occasioned, and even by the very *raison d'etre* of such a report as that to which we have thought it right to draw the attention of our readers.

REGISTRATION OF INFECTIOUS DISEASES.

In our last issue we gave a brief report with respect to a deputation from the Society of Medical Officers of Health to the President of the Local Government Board. On this occasion the remarks which Mr. Sclater-Booth made in reply to the deputation were so judicious and practical that they deserve the careful consideration of those sanitarians who are inclined to push their reforms too far, as well as of those members of the profession who may be disposed to resist innovations which are made in the interests of the people. In the opinion of some the law should step in to compel either the medical attendant or the tenant of the house to give information of the prevalence of infectious diseases, while some means should be adopted by which proper disinfection, or the isolation of the patient, should be secured independently of any action taken on the part of the practitioner in attendance. There can be no doubt that the registration of infectious diseases would be a move in the right direction, especially in the more densely populated districts of large towns; but many objections will be made to this registration being used as a means of interfering too much with the liberty or personal responsibility of the public, or of the medical profession. As Mr. Sclater-Booth observed, the plan of making the occupier responsible for communicating information was open to objections until the householder was assured by some provision of the law that the interference would not be undue or excessive or out of proportion to the necessities of the case. Then, again, with regard to medical men, any obligations imposed upon them to make known cases of infectious disease might be opposed on the ground that it would put them to much trouble and inconvenience, that it would involve a breach of confidence as regards their patients, and that such information might lead to an intrusion of sanitary officials upon the hygienic and even medical management of their patients. Mr. Sclater-Booth remarked that his information led him to suppose that there was a good deal of jealousy in the medical world of interference between them and their patients, and they would resent very much being placed under the authority of another medical man as regarded the means to be adopted for sanitary purposes. The registration of disease, however, is a proceeding which is quite correct in principle, and we do not think that the profession, either individually or collectively, have any reason to fear that such registration would be abused, or that it would work to their prejudice in any way. On the contrary, we think that the registration of infectious diseases, and the probable action of the sanitary officer to which it would lead, would relieve the medical attendant of much trouble and responsibility, and enable him to devote the whole of his time and attention to the actual treatment of the disease itself. For it is to borne in mind that it is in the lowest and most densely populated districts that compulsory registration and the supervision of the officer of health would be most needed, and where the medical attendant and even the occupier of the house are the least able to grapple with the obstacles that stand in the way of the isolation and hygienic management of infectious maladies.

We therefore cannot find fault with the resolutions which were recently passed by the Society of Medical Officers of Health, and which were pressed upon the attention of Mr. Sclater-Booth by the deputation to that gentleman. As to who is to be made responsible for reporting the case to the sanitary authorities is a question which requires some consideration, but no one would deny that it is the duty of the medical practitioner in attendance to make the occupier of the house aware of the infectious nature of the disease under his care, and that with as little delay as possible. At all events, the present legislative provisions for preventing the extension of infectious disease is in a very unsatisfactory state, and we feel certain that the profession at large will be disposed to assist rather than oppose the efforts which our sanitary authorities are making to bring about some amendment of the Public Health Act.

Notes on Current Topics.

Suppression of Intemperance.

Not long ago the British public was surprised and not a little indignant at the proceedings of a Liverpool police inspector in his zeal for the abolition of drunkenness. We learn from the *Canada Lancet* that some of our American cousins propose to be equally "thorough" in their dealings with this great vice of the age. It has been seriously recommended, says the editor of the above journal, that the American Government should introduce a general and comprehensive measure for the prevention of all drunkenness. Amongst other matters there is a recommendation that medical vendors alone should be licensed to sell ardent spirits, and that foreign

spirits should be admitted only for medical purposes, or sold in bulk. The absurdity of this proposition and the little influence it would have in attaining the object in view are sufficiently apparent, and we are glad to see that the American editor totally repudiates and even ridicules the idea. As he says, Government is warranted in imposing the highest licence it can consistent with the prevention of illicit sale. Everything else must be left to the gradual improvement of national manners. Nor must we forget to make some allowance for that almost universal craving which, to use the language of the great statesman and orator, quoted by our contemporary, has, "under the pressure of the cares and sorrows of our mortal condition" induced "men at all times, and in all countries, to call in some physical aid to their moral consolations—wine, beer, opium, brandy, or tobacco."

A Case of Intussusception.

A CASE of intussusception of some interest and variety, in which the patient recovered after the separation and expulsion of a large portion of the pleura, is recorded in a recent number of the *Boston Med. and Surg. Journ.* The patient was a man over 70 years of age who, three weeks after an attack of colic and intestinal obstruction passed per rectum a portion of the small intestine measuring upwards of 17 inches in length, an event which was only preceded by a slight elevation of temperature and a feeling of general malaise. The main features of the case, as summed up by one of the doctors in attendance, were :— 1. The great length of the invaginated intestine expelled ; 2. The absence of severe pain and stercoraceous vomiting during the attack ; and 3, the advanced age of the patient. From the circumstance, also, that the specimen when expelled was not inverted, Dr. Wyman (who among others had seen the case in consultation) concluded that the intussusception might have been upwards.

English Practitioners in France.

FROM the *Times'* Paris correspondent we hear that the *Débats* and several other papers condemn M. Marvaise's Bill on foreign doctors, but it has found an advocate in *XIXeme Siècle.* M. Lefort, Professor at the Paris Faculty of Medicine, maintains in that journal that the Bill only puts English practitioners in France in the same position as French practitioners in England. He concludes his article by rallying Englishmen on their notion of carrying English laws with them wherever they settle, and remarks that while France will remain hospitable, she will no longer be a dupe. It is a somewhat significant fact, and one which tells in favour of the view we have all along taken of this question, that English practitioners in Paris approve the Bill as the only practical protection against charlatans.

The Vivisection Act.

THE Chief Secretary has appointed Dr. W. M. Burke, the Registrar-General of Births, Deaths, and Marriages in Ireland, to be Inspector under the Cruelty to Animals' Act, 39th and 40th Vic , cap. 77, for that division of the ngdom.

Salubrity of the Suburbs of Dublin.

THE Irish Registrar-General, in his report of the past week, remarks that there was no death from any of the seven principal zymotics in either Donnybrook or Blackrock. The average death-rates of the four suburban districts of Dublin for the last ten weeks were as follows :— Rathmines, 19·0 per 1,000 inhabitants ; Donnybrook, 19·0 ; Blackrock, 18·0 ; Kingstown, 23·0.

"Castor-Oil Lozenges."

A CORRESPONDENT of a medical contemporary calls attention to the extensive sale of so-called "castor-oil lozenges," which he says are largely used by pregnant women of the lower class, and commonly given to children in the East of London as a pleasant aperient. In the letter it is implied that each lozenge contains three grains of calomel, and the writer states that he has just seen a severe case of mercurial salivation in a young girl who had taken half-a-dozen in two days.

Discussion on the Use of Cold Baths in the Treatment of Typhoid Fever.

THIS subject has formed the basis of an interesting discussion by the Hospital Medical Society of France during many of its sittings, and is not yet finished. As a question of practical therapeutics, its interest is very great. It has had its supporters and antagonists in England, but the prevailing opinion is that its use should be limited to exceptional cases. We have had many specifics for typhoid fever, *e.g.*, the sulphurous acid system, but some of them have had only a brief reign ; and we are still in search of light and instruction.

Many eminent French physicians pronounce in their favour, principally looking to the lowering of the temperature. The remarks of M. Petis are well worthy of consideration, and we give a brief analysis of them.

To his mind the theory of cold recals an old method which made a great noise in its time, viz., bleeding. This doctoring rejects medical ontology. The hyperthermia alone is considered, and is the monster to be destroyed. The hyperthermia is only a symptom—a morbid element, and nothing more. The cold bath abstracts only the caloric, whilst the age, sex, and temperature of the patient are not considered. It is not then, properly speaking, treatment. Every simple formula in pathology and therapeutics is doubtful. The following complications might result from its use :—

1st. Epistaxis, intestinal hæmorrhage, the latter being observed five times in twelve cases where the system was adopted.

2nd. Renal congestion and albuminuria.

3rd. Congestion of the lungs.

4th. Syncope from weakness of the heart's action.

When the blood is driven from the periphery, where does it go ? to the least resting part, and hence such accidents as above mentioned. We give in another column the views of M. Maurice Raynaud.

IN consequence of a sudden and unexpected epidemic of cholera in Madras, the death-rate has risen to 64 per 1,000 of the population.

The Laws of Health.

A SHORT time ago we made some editorial remarks on the above subject, in connection with a series of popular lectures now being delivered before the Society of Arts. We then suggested that as regards the sanitary education of the people, more might be done by single lectures, frequently repeated in the more densely populated districts of large towns than by a course of lectures before a certain number of people, whose position and education placed them less in need of such instruction than thousands of the poor, who would never hear of these lectures. We also suggested that much good might be done by distributing small tracts on health among the lower classes of this and other great cities. The excellent speech, however, which Dean Stanley made last week at one of the lectures over which he presided, reminds us that we forgot one great lever that might be used in raising the sanitary conditions of our poorer citizens to such a standard as would materially add to their health and comfort. There can be no doubt that the clergy have frequent opportunities of impressing upon their poor parishioners the importance of cleanliness and of such other conditions of health as are within their reach. There are, however, few clergymen who are so free from bigotry and narrowness of mind as Dean Stanley, or who would, if the occasion presented itself, follow the example of the great John Wesley, who, said the dean, once converted a whole household by pulling up his shirt sleeves, flinging open the windows, and emptying all the dirty water that was poisoning the domestic atmosphere. We do not think that hitherto the clergy have been so interested in the cause of public health as Dean Stanley represents them to have been, but now that sanitation is attracting so much attention, we believe that we shall find in the industrious curate, or the city missionary, a valuable coadjutor in educating the lower classes in habits of cleanliness and temperance. It is only within the last few years that the profession itself has directed attention to domestic hygiene, and therefore we cannot be surprised at the clergy, whose business is the "cure of souls," not taking much interest in a subject which was even neglected by the medical attendant himself. But times are now changed, and we shall look forward to much assistance from the clergy in questions of a sanitary nature, when we hear the Dean of Westminster asking :—"How can a man turn his mind to great and holy and splendid things, unless he is relieved from the burden of bad air, and fever, and misery that oppresses him?"

On the Movements of the Brain.

IN a woman who had lost a great part of the two temporal and frontal bones from syphilis, MM. Giacomini and Mosso (*Le Journal Thérapeutique*, Jan. 25th, 1877) have established many kinds of movements in the brain.

1. *Pulsations* produced at each contraction of the heart.
2. *Oscillations* corresponding to the movements of respiration.
3. *Undulations*, which are large curves due to the movements of the vessels during attention, cerebral activity, sleep, and other unknown causes.

The authors designate these last movements under the name of *spontaneous movements* of the vessels. Intellectual work reflected itself on the brain, which underwent a visible modification of volume and of the form of the pulsations.

Anæsthesia by the Injection of Chloral into the Veins.

MM. TIZZONI and GRACINTO FAGLIATA (*Revista Clinica di Bologna*) have examined the following points :—

1. Is chloral injected into the blood a true anæsthetic?
2. Is there any serious danger from its use?
3. What are the risks?
4. Upon what element does the chloral act?

They have drawn the following conclusions :—

1. It is not a true anæsthetic, but a powerful hypnotic. Cutaneous sensibility is not abolished except by large doses. The cornea never properly loses its sensibility.

2. It is dangerous ; it is difficult to measure its action, which varies in different people ; it easily excites phlebitis. It is a poison to the heart.

3. Chloral acts directly on the muscular fibre. It determines contraction of the muscular fibre, and the heart stops in systole.

4. The best means to remedy accidents from chloral is to throw cold water on the head and spine. Pretended antidotes of strychnia, quinine, atropine, and curara are bad.

These writers are opposed to the method of Dr. Ore, of Bordeaux.

Short Service Failure.

THE failure of Mr. Hardy's short service system to attract to the army the class of medical officers who would otherwise enter it, brings us face to face with a difficulty which must sooner or later be got over. Under the old rules an officer who served ten years was entitled to a pension of £185 for life, if incapacitated for duty by ill-health contracted in the service. The value of Mr. Hardy's short service proposal was about £75. Can it be wondered that such a scheme failed in attraction to but a few? We express it as our decided conviction that if the right honourable gentleman will restore to the medical officers the privileges granted to them by the Royal Warrant of 1858, abolish the short service, give to the surgeons the command of their own subordinates, insure the retiring allowance after twenty years' service, make surgeons of twenty years in the army to rank *with*, but not *junior* to, all other officers, give to the surgeons staff quarters as staff officers, or allowances *in lieu ;* make the uniform more attractive, and allow a soldier servant and soldier groom to mounted officers ; a few more additional good-service pensions and honorary distinctions; he will find that there will be no lack of candidates for the appointment of royal surgeon in the army. It was always, in our opinion, a mistake to extend the age beyond twenty-five years, or to abolish the examination for promotion, mistakes as easily rectified as transferring stores to officers when they might be equally well cared for by hospital students.

A Royal Hospital Corps.

THE military hospital having become the unit of medical relief in the army, what more fitting opportunity

could there be for embodying into a royal corps the *infirmiers* and officers of the medical staff? It has been truly said that a department tacked on to the tail-end of the Army List will never carry with it the *prestige* of a corps. We fully endorse this sentiment, and believe the change indicated would have the happiest effect.

The New Hospital for Norwich.

A FEW weeks since we mentioned that H.R.H. the Prince of Wales presided at a meeting at Norwich in aid of a fund for the alteration and enlargement of the hospital in that city. The sum asked for on that occasion has been more than subscribed, and the Earl of Leicester came forward with an additional donation of £13,000. Since then the subjec t has taken a new phase, and the old hospital and its enlargement has been discarded for a new building which is estimated to cost from £35,000 to £40,000. To this alteration the Prince of Wales has not only given his sanction, but has promisad an additional £200 from himself, and £100 from H.R.H. the Princess. At a meeting on Saturday last, when the change was definitely decided upon, the Rev. J. Fisk promised £1,000, and additional sums from Lords Calthorpe, Stafford, Leicester, and others went to swell a very handsome contribution.

The Water Supply of London.

THE columns of our contemporaries afford daily evidence of the highly impure state of the London water supply. An inhabitant of that fashionable quarter Kensington, in a letter to the *Times*, complains that a sample of water taken from a cistern in his house was found so charged with organic matters that he and his family were in hourly danger of a fatal overdose of the polluted mixture, or of eventually falling victims to typhoid fever. It will be said by the water company supplying the district this is an exceptional state of things, due to the floods which cover the land in every direction. But do not Major Bolton's monthly reports show that Thames water rarely reaches a decently wholesome standard, and is never free from dangerous organisms. So much has been written and said about the shortcomings of the water companies that it would be difficult to find a word of excuse for the continued existence of a danger to health and life, and that permits water companies to draw their supply of water from so contaminated a source as the Thames, and dole it out at a price out of all reason, were it perfectly pure. A deputation of the representatives of many of the vestries and of the National Chamber of Trade waited upon the Home Secretary, to urge upon him the necessity of bringing the matter before the Government. Mr. McCullagh Torrens and other members of the deputation pointed out the great importance of the question, and the grievances under which the households of the metropolis labour. A practical suggestion towards a solution of the difficulty was offered by the constitution of a central authority to assume the duties of the eight existing companies. It is clear that if some such change could be made a considerable improvement would take place in the quality of the water, a constant supply secured, and a saving effected, which must remedy the unfair inequality that characterises the levying of water-rates. Under many conflicting Acts of Parliament the companies were permitted to charge for the water supplied upon the annual valuation of the house. *The gross annual value* is the interpretation put upon their words, and as the rateable value of the metropolis has, within a very short time, doubled, the amount charged by the companies has increased in a manner not at all contemplated at the time the Act was passed. The eminent water engineer, Mr. J. E. Homersham, has, in the event of the Government refusing to make an attempt to deal with existing evils, proposed to the Wimbledon ratepayers to obtain for them a pure and abundant supply of water from an artesian well sunk into the chalk at Wallington, and pumped into a reservoir at Woodcote, 201 feet above the level of Wandsworth common. He has already bored through the chalk, and found an abundant supply of potable water, of an excellent quality, having sixteen degrees of hardness, but which can be reduced to four by Clark's softening process. As a commercial speculation, this project, if carried into effect by a company, could be made to pay 5½ per cent. upon the outlay, while the locality would be certain to secure an immeasurably superior quality of water obtained from a subterranean source, and as compared with that derived from the Thames, polluted, as Mr. Homersham justly says, "by a million of slop-pails," is as a dose of deadly poison to a wholesome and cooling beverage.

Homœopathic Gynæcology.

IN the *British Journal of Homœopathy* for January, a writer on pathology and therapeutics of the cervix uteri gives sixteen classes of ulceration, viz.—strumous, venereal, gouty, osteo-arthritic, hepatic, mammary, cardiac, asthmatic, choric, cataleptic, epileptic, tetanic, special sensory, mental, moral, mechanical. In hepatic cases moschus is recommended, in cataleptic, cannabis, in tetanic, strychnine. In mental cases, we are told the memory steadily mends under anacardium, while even for moral ones the author does not despair. He tells us of one patient cured of the desire for self-destruction by actœa, which he says also is the best for undefined dread of impending evil. The *Doctor* asks, "could he give us a globule for want of faith? We might try it before the next number of the journal appears."

The Cholera Epidemic in Madras.

SURGEON-GENERAL GORDON, writing to us from Madras, represents matters as being very sad in that Presidency. He says; There is a very severe famine here, scarcity of water, and an alarming epidemic of cholera, the latter chiefly amongst the natives. Last week there were more than 6,000 deaths by it in this Presidency.

Vortex Motion.

IN our last we announced that Professor Osborn Reynolds would lecture on this somewhat obscure subject, at the Royal Institution; and as it was expected to be made interesting by promised experiments, a numerous and critical audience assembled on Friday evening to hear what the learned Professor had to propound. The lecturer adverted to the fact that what he was able to reveal had

been discovered by the simplest and most common-place methods, but much was to be derived from methodical experiments. The study of fluid motion was one of the earliest branches of mathematical research, and the result had been a great success for science, other branches of which had been aided by their investigations, though many persons who had prosecuted them had been compelled to work, to a great extent, in the dark. The learned Professor proceeded to make various experiments, accompanied with lucid verbal explanations, aided by plans, diagrams, and models. Some of these experiments, he remarked, were the effect of very close observation, and by these and others which it was hoped might follow them, the domain of science had been and probably would be enlarged.

Absence of Kidney, Ureter, Vas Deferens, and Vesicular-Seminalis of Left Side.

We learn from the last number of *Le Progrès Médical*, that an extremely rare and interesting case in which the absence of the above organ was described, has recently occurred in the clinique of Professor Bouchard, at the autopsy on a patient who died from cerebral apoplexy at the Hospital Bicêtre. This is the second case reported in France during the last few years; the previous one was brought before the notice of the Anatomical Society of France, in 1870, by Dr. Reverdin.

The Bressa Prize.

By the will of Cesare Alessandre Bressa, Doctor in Medicine and Surgery, signed the 4th of September, 1835, that gentleman left all his property, after paying certain legacies, in remainder expectant on the expiration of a life interest, to the Royal Academy of Sciences of Turin, with power to convert and put the capital out to interest in the way deemed most profitable; and with the interest of this property a biennial prize was directed to be established, and adjudged in the following manner:—"The net interest of the first two years to be given in premium to that person, of whatever nation or country he be, who shall have during the previous four years made the most important discovery, or published the most valuable work on natural and experimental philosophy, natural history, mathematics, chemistry, physiology, and pathology, as well as geology, history, geography, and statistics. The net interest of the following two years to be given only to an Italian, who, by judgment of the above-named Academy of Turin, shall have made the most important discovery, or have published the most important work on any of the above-mentioned sciences. The prize will continue to be distributed in the same order." The Academy has accepted the task, with the intention of fulfilling to the best of their ability the generous wishes of the testator, and the first open prize will be given in the year 1879. The value amounts to 12,000 Italian lire, or about £370 sterling. In accordance with the spirit of Dr. Bressa's will, the Academy will choose the best work or discovery, whether or not it be presented by the author. The prize in no case will be given to any of the National members of the Academy of Turin, resident or non-resident. In the year 1881 the second Bressa Prize will be given for the preceding quadrennial term 1877-1880, according to the above rules, to an Italian. And so on every four years there will be a Bressa Prize for competition among scientific men of any part of the world, and every four years a Bressa Prize which can be competed for by Italians only.

Another Hospital for Dublin.

A special Hospital for the Throat and Ear has been opened in York Street, Dublin, under the patronage of the Duke of Abercorn, and many persons of distinction in Ireland. The Institution is under the auspices of Mr. Smyly of the Meath Hospital, Surgeon to the Lord Lieutenant; of his brother Mr. W. Josiah Smyly, and of Mr. Kendal Franks. The Committee justify the establishment of this Hospital by the great success of two such institutions in London, and the great difficulty of treating diseases of the throat in the general hospitals; and while they repudiate with emphasis any spirit of opposition to any other institution, they state the object of its establishment as to supplement the general hospitals of Dublin, and enable the poor to avail themselves of the recent improvements in the special department of diseases of the throat.

A secondary object and little less important than the first, is to enable the student to become familiar with the daily use of the laryngoscope.

It is the fashion to depreciate the value of special hospitals, on the ground that many of them are proprietary and really for the benefit of the surgeons, though ostensibly charitable. We never joined in this cry, and we are, therefore, always satisfied to recognise the creation of a special hospital, as long as the character of those in charge is such as to guarantee that the poor shall have at their disposal the best advice and care. The charge that special hospitals are really for the benefit of the medical staff, may with nearly as much force be made against general hospitals; and there can be no doubt that certain diseases are better treated under the pecuniary circumstances of a special institution than in the wards of a large general hospital. On this subject Mr. Morell-Mackenzie expresses the following opinion:—

"I feel bound to state my conviction that special hospitals, as a rule, are far more efficient than the special departments of general hospitals. As a rule, in general hospitals the same sets of rooms are used at different times for various specialities, and arrangements which are suitable for the treatment and investigation of one class of diseases are inconvenient for another. Moreover, a special hospital affords the means by which men already engaged in practice may be rendered familiar with all the latest improvements in that department of medicine or surgery to which it is devoted. It displays a greater wealth and a better concentration of material than can be found at any special department of a general hospital."

Vaccination Direct from the Calf.

In a letter to a daily contemporary on Monday Dr. George Wyld advocates, as he did also in a former letter, vaccination direct from the calf. He states that this method has been followed in Belgium for ten years with complete satisfaction both to the public and the profession, and that the protection afforded thereby against small-pox is

such that out of 10,000 traced cases thus vaccinated there has not occurred a single instance of the disease. In a previous letter to the same paper he states that, in his opinion, the lymph derived directly from the calf is "much more powerful in protecting from small-pox than the enfeebled infantile lymph now in use," while it has the further advantage of not involving those constitutional risks so much dreaded by a large proportion of our population.

We understand that several medical men, supported by a City vestry, have in the meantime taken action, and hope soon to produce a supply of vaccine lymph direct from English calves. In the meantime Mr. Allshon, of 51 Edgware Road, will endeavour to keep a supply of calf lymph in points for the use of the profession. Notwithstanding the opinions entertained by most of our vaccination authorities that the lymph does not deteriorate by passing through any number of individuals, it is just possible that lymph direct from the calf may insure a longer period of protection from small-pox than that secured by lymph taken from the human subject, and that the former might afford protection under circumstances in which the latter might prove unsuccessful. There would, however, be much difficulty in keeping up the supply in large cities, and besides the pressure of the great demand for it there would also be the risk of the lymph being sometimes taken from an unhealthy calf—a risk, moreover, over which the medical practitioner would have little or no control, as most of it would probably be purchased from, or supplied by, certain depots established for the purpose.

Army Medical Examination.

It is believed that of the total number of schedules applied for only twenty-four have been returned by intending candidates, and as fifty vacancies are offered for competition on the 12th instant, this result may be accepted as a complete failure. There will no doubt now be some mutual recrimination between the unificationists and the proposers of the short service scheme, each attributing to the other the source of the collapse.

The former are, however, somewhat handicapped in the discussion by the fact that an examination had already failed to attract competitors before the short service was adopted. It is a pity that the opinion of some ordinary executive medical officer of average intelligence is not asked, since the remedy is simple and economical enough, and perfectly obvious to any one unbiassed by preconceived theories.

Typhoid has almost entirely subsided in Paris; there were but 30 deaths from this zymotic last week.

Small-pox is slightly increasing in Vienna, in which city there were 26 deaths last week.

The deaths from small-pox last week in London and the other large towns were 113, the same number as the previous week.

Henry Gray Croly, F.R.C.S., Senior Surgeon to the City of Dublin Hospital, and Member of the Court of Surgical Examiners, Royal College of Surgeons in Ireland, has been unanimously elected Consulting Surgeon to the Rathdown Hospital.

The death of Lady Smith, relict of Sir James Elward Smith, which occurred on Saturday, at her residence at Lowestoft, in the 104th year of her age, recals to memory the services of her illustrious husband, who was a member of our profession, and founder, in 1788, of the Linnæan Society, and President of the same body until his death in 1828. Lady Smith was born in May, 1773, and she was married in 1790.

The Anthropological Society of Paris is busy upon the organisation of an exhibition which is to be held contemporaneously with the great Exhibition of 1878. The Exhibition will be held in the Trocadero Palace, and will have the name of "The Universal Exhibition of Anthropological Sciences." It will be divided into four sections. 1. Anthropology proper and Craniology .2. Ethnography of France and other Countries, especially those inhabited by Savages. 3. Prehistoric Archæology. 4. The History of Language. The Exhibition will be unique. A record of man in the present and past.

We understand that the Veterinary Department of the Privy Council has issued a circular letter to all local authorities throughout the country, stating that there is reason to fear that infected animals may have been moved out of the metropolis before the recent stringent regulations came into force, and urging the importance of strict inquiry as to the sanitary condition of the stock in their respective districts. It is also recommended that competent veterinary surgeons be deputed to act in this emergency, with full power to order the immediate slaughter of any animal affected with cattle plague.

The next meeting of the Pharmaceutical Society of Great Britain will be held this evening at 8 o'clock. The following papers will be read :—

"On the Admixture of Veratrum with Valerian Root." By Prof. Bentley.

"The Colouring Matter of the Petals of Rosa Gallica." By Mr. Harold Senier.

"Note on the Action of Dilute Nitric Acid on Brucia." By Mr. W. A. Shenstone.

"The Pharmacopœia Test for Quinine Sulphate." By Dr. B. H. Paul.

Correspondence.

UNQUALIFIED ASSISTANTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—My attention has been lately drawn to a question highly interesting and important to the medical profession generally, and especially so to those who are indirectly connected with the same—I refer to that class who are termed "unqualified assistants,"—a set of men extremely useful, and it would be a great disadvantage to us who are qualified were we to be deprived of their valuable aid, for I am sure a great

number of them are as well acquainted with the requirements of the "healing art" as those who are in the profession, and more so in some instances. I have known some who, had they been qualified, would have held a position second to none, in fact, would have been leading practitioners, but who, owing to some early misfortune, or youthful indiscretion, have been unable to terminate their studies satisfactorily, and so have been compelled to drop into the ambiguous position of unqualified assistants.

These prefatory remarks will, I sincerely trust, prove to these gentlemen-hangers-on (whose *locus standi* in the profession has given rise to some comment) my desire to treat them with no discourtesy; and all my observations on their position in the said profession will be made with due regard to justice and fair play.

There is not the slightest doubt but that the present ambiguous position of unqualified assistants has been brought about by two principal causes—*Firstly*, many of them being ashamed of their almost menial standing, lead the patients of their principals to suppose that they are doctors *de facto*. *Secondly*, many principals, through a weakness of mind and a silly, false pride, wish their patients to be under an impression that their practices are of such extent that they are obliged to employ qualified assistants, or, perhaps, through a laziness of temperament, they pay them to do most of the work, especially that of an unpleasant nature, which they would be obliged to perform themselves were the patients cognisant that their assistants were unqualified.

I have known some medical men most emphatically inform their relying patients that their assistants could not be otherwise than qualified, because they were very well aware that some invalids have great objections to being attended by men *minus* a qualification, for they imagine, sometimes with great injustice, and much more frequently with justice, that because a man is not qualified he must, of necessity, be an ignoramus; therefore, to quiet their patients, they are gravely told, or indirectly led to believe, by the principals that their assistants stand high in the medical profession, otherwise they would not have employed them.

There is another evil, which, fortunately, has almost gone out of vogue, and that is, if a medical man holds a union appointment he leads his parish patients (who, on account of their position as such, are considered by him as beneath his notice) to believe that his assistant is a doctor, and accordingly they are delivered over to the tender mercies of a man who holds no qualification whatever. That state of affairs has nearly, if not altogether, died a natural, though it must be acknowledged a slow death, for now nearly all the unions (for there are still some exceptions in small country districts) are obliged to be committed to the charge of a properly qualified medical man, and if a medical officer is now appointed to one he is bound, in case of illness or otherwise, to find a substitute, who must possess at least one diploma.

There is yet another evil, and that is, if a medical man has a large private and club practice he employs an assistant—ten to one, unqualified—to attend the clubs while he takes upon himself the charge of the private patients, and this veracious disciple of Æsculapius most likely pursues the same dishonest practice of informing his fortunate club patients that his assistant is, *of course*, qualified, and that if he had not been he would not on any account have employed him, and to make it appear more important, he would not have engaged his valuable services, so that the assistant Dr. Smith or Dr. Jones is employed by his most honourable principal to do all the dirty work; consequently, this questionable doctor is put at once into a false position, and he, if he desires to keep his situation, is, of course, under the necessity of acquiescing in his principal's proceedings, and if the said doctor is of a vain turn of mind he rather rejoices in the cheat than not, and struts about at the clubs, and perhaps gives a specimen of his oratorical powers with the greatest dignity he can possibly assume at their meetings, or at their non-Bacchanalian feasts.

Now, if an unqualified assistant wishes to keep his own self-respect and gain the good opinion of his principal, he should at once disclaim any connivance at false pretences, and if his principal objects to honourable practice, it will do him no harm in the long run were he to throw up his berth at once, for such an act would show that he and his proceedings were looked upon by his assistant with all the scorn and contempt of an honest man, and he would undoubtedly find many who would be only too glad to secure his services as an assistant, and *not* as a *sham* doctor.

Unfortunately for the dignity of the profession, there are many unqualified assistants who, as I have previously mentioned, are ashamed of their position, and, for the sake of appearing what they are not, try all they possibly can to impress upon the patients, &c., that they are veritable medical men, like the poor jackdaw who wished to emulate the peacock, and accordingly abstracted some cast-off plumage, with which he decked himself, being confident that he could not possibly be found out; but when he endeavoured to pass himself off as one the counterfeit was soon discovered, and when the crest-fallen cheat was exposed with what contempt and derision was he driven both from the society of those he so much envied, and essayed so much to imitate, and also from the companionship of his right-minded brother jackdaws, of which I hope there *are* a *few*.

Well would it be for this somewhat numerous class of unqualified assistants were they to take to heart this simple though instructive fable, and act more like honest men, determined to do their duty in that position Providence has called them, and not degenerate into contemptible shams and aping jackdaws.

This most important medical question is so wide, and there is so much more matter appertaining to it than is touched on in this letter that most likely you will hear from me again.

I am, Sir, yours obediently,

Camberwell. E. M. B.

ETHER INHALATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Allow me to offer a few observations in reference to your admirably illustrated notice, which appears in this day's issue on the subject of Dr. Ormsby's inhaler.

Far be it from me to detract from the merits of the talented gentleman's inventive genius; at the same time there are many inhalers as reliable as the one you seem to advocate so earnestly.

The question for the medical practitioner to consider is, not who was the originator, or the ingenious adaptor of a particular inhaler; but he should direct his inquiries as to what form of inhaler (no matter by whom introduced) is the *most efficacious in its action* and the *most simple* in its construction. I have used many forms of inhaler, but I find none so efficient as *Skinner's Improved*. It has the advantage of being most moderate in price (7s.), efficacious in action, and simple in construction. It consists of a conical leather bag, with a double lining of thick felt, and in outline resembles a fool's cap. Apologising for intruding so much on your valuable space.

I am, Dear Sir,
Yours very truly,
FRANK THORPE PORTER, L.R.C.S.D.

15 Upper Merrion Street,
January 31, 1877.

[If our correspondent considers that ether vapour, when largely diluted with air, will produce as satisfactory an anæsthesia as when undiluted, he has an innumerable variety of inhalers to select from, and no doubt Skinner's is as good a form as any other. Our experience, however, is that the dilution of the vapour by any means is the cause of all the *desagremens* of ether as compared with chloroform, and, therefore, we do not approve of any apparatus which does not provide for the exclusion of air from the lungs.—ED. M. P. & C.]

Medical News.

Royal College of Physicians of London.—The following gentleman was admitted a Member of the College on Jan. 25th:—

Crocker, Henry Radcliffe, M.D. Lond., Univ. Coll. Hosp.

Royal College of Surgeons of England.—The following gentlemen were admitted Members of the College at meetings of the Court of Examiners on January the 25th and 26th:—

Arnott, Sandford, St. Vincent's, West Indies.
Biale, John S., Phillimore Place.
Blamey, James, L.S.A., Penryn, Cornwall.
Brown, John A., Peckham.
Bunny, Joseph B., Newbury.
Byam, Samuel H., L.R.C.P. Lond., Exmouth.

De Caux, Frederick, L.S.A., Norwich.
Dening, Edwin, Taunton.
Freer, Edward L., Birmingham.
Groves, Henry E., Regent's Park Road.
Haines, William John, Hendon.
Henderson, George C., Jamaica.
Hunt, George A., Rocester.
Jeans, Francis A., Pinner.
Kempe, Arthur W., Brent.
Lake, William W., L.S.A., Ilford.
Langton, Herbert, Brighton.
Lees, Clement, Birmingham.
Liddell, Henry J. S., Ivy Bridge.
Lloyd, David, L.S.A., Newcastle Emlyn.
Maclean, Fitzroy B., Kew.
Marsh, William G. H. B., Bristol.
Morris, Clarke K., Spalding.
Perry, Charles E., Henley-on-Thames.
Roberts, Henry W., L.S.A., South Square.
Robertson, George S., L.S.A., Dover Street.
Ross, John H., Bloomsbury Square.
Semple, Edward, Totness.
Smith, William Henry, L.S.A., Sibsey.
Solomons, Philip F., Ceylon.
Steedman, Percy A., Cape of Good Hope.
Toll, John T., L.R.C.P. Edin., Port Adelaide.
Turner, Alfred M., L.S.A., Gloucester.
Walker, Basil W., Great Yarmouth.
Watson, Charles J., Norwich.
Welchman, Walter H. L., L.S.A., Falmouth Road.

Of the 127 candidates examined during last week, 74 passed to the satisfaction of the Court of Examiners and obtained their diplomas; 19 passed in Surgery, and when qualified in Medicine will be admitted Members; the remaining 34, having failed, were referred for six months' further professional study.

Liverpool Medical Institution.—At a special meeting of the Liverpool Medical Institution, held on Friday, January 26th, to consider the present method of electing the honorary medical officers to the Liverpool charities, Dr. Turnbull, President, in the chair, the following resolutions were passed:—Proposed by Dr. Waters, seconded by Mr. Bickersteth, "That in the opinion of this meeting the election of the honorary medical officers of the great medical charities by so limited a body as a committee of management is open to grave objection and liable to abuse, and that it is calculated materially to affect the interests of these charities." Proposed by Dr. Cameron, seconded by Mr. Shadford Walker—"This meeting having heard that it will be proposed at the annual meeting of the Royal Infirmary to alter the laws of the institution so as to place the election of the honorary medical officers in the hands of the committee, would earnestly impress on the trustees the desirability of not making the proposed change." Proposed by Dr. Vose, seconded by Dr. Carter—"That copies of the foregoing resolutions be sent to the president and chairman of the Committee of the Royal Infirmary, to the Liverpool daily papers, and to the medical journals."

NOTICES TO CORRESPONDENTS.

"MEDICAL PRESS" DEFENCE FUND.

The Honorary Treasurers beg to acknowledge with thanks the following contributions to this Fund, which they have received since the publication of the last list in our columns:—

	£	s.	d.
Dr. Broadbent, London	1	1	0
Mr. F. P. Hoblyn, Bath	0	10	6

The Poor Medical Student Fund.—The List of Subscribers to the above will appear in our next issue.

The Medical Society of the King and Queen's College of Physicians, Ireland, will meet this evening at 8 o'clock at the College Hall, when the following communications are set down for reading:—Dr. Hayden, V.P., "Notes on Anhidrotics."—Dr. Duffey, "On a Case resembling Addison's Disease."—Dr. Finney, "On Intrathoracic Tumour simulating Aneurism."

To the Editor of the Medical Press and Circular.

Dear Sir,—If a Licentiate of the Dublin College of Surgeons engages in veterinary practice without being legally qualified to do so, is there any way of preventing such a scandal? A gentleman said to me the other day—"Your profession is becoming d—— low when you have to interfere with the Vets."

Yours truly,
Feb. 1, 1877. A. Spavin.

[A licentiate of any college may engage in the disinfection of cloacæ if he pleases. There is no legal qualification for a veterinary surgeon. It is altogether another question whether to engage in veterinary practice is *infra dig.* In our opinion it merits the expletive recorded by our correspondent.—Ed. M. P. & C.]

The Obstetrical Society of Dublin will meet on Saturday next, at 8 o'clock, in the College of Physicians, when the following communications are set down for reading:—Dr. Purefoy, "On a Case of Extra-Uterine Fœtation."—Dr. Finucane, "On Erysipelatous Metritis."

Mr. Lennox Browne wishes us to state that the advertisement which appeared in our last number headed, "Important to all Vocalists," was without his knowledge and sanction. The copyright of his pamphlet, "Medical Hints on the Singing Voice," is the property of Messrs. Chappell, the musical publishers, to whom must be attributed any little indiscretion in the form which advertisements may take, of which the one sent by them in the ordinary course to our publishers last week may be taken as a type. We are glad to have received this explanation from Mr. Browne, as our attention had been drawn to the advertisement as "somewhat unprofessional."

The first evening meeting of the Pharmaceutical Society of Ireland will be held on Thursday, Feb. 8th, 1877, at the King and Queen's College of Physicians, Kildare Street, Dublin. Chair to be taken at 8 o'clock, p.m. *Communications:*—H. N. Draper, F.C.S., M.R.I.A.—"On the Solubility of Ether in Aqueous Hydrochloric Acid."—Walter George Smith, M.D., &c.—(For Exhibition): "Specimen of a new variety of Pale Catechu."—C. R. C. Tichborne, Ph.D., F.C.S., &c.—"On Salicylate of Atropia, and its application to Pharmacy."

Dr. Timothy.—Your communication is unavoidably postponed owing to pressure on our space.

MEETINGS OF THE LONDON SOCIETIES.

Obstetrical Society of London.—This evening (Wednesday), at 8 o'clock, Specimens.—President's Address.—Drs. Hickman, Godson, Heywood Smith, and Elkington: "Cases of Inversio Uteri."—Dr. Braithwaite, "On the Treatment of Retroflexion."—And other communications.

Royal Microscopical Society.—This evening (Wednesday), at 8 o'clock, Anniversary Meeting, President's Address, &c., &c.

Clinical Society of London.—On Friday next, at 8½ p.m., Mr. Christopher Heath: Sequel of a "Case of Aneurism of the Aorta treated by Ligature of the Left Carotid Artery"; communicated in 1872 (a living subject).—Mr. Holmes: Sequel of a "Case of Aneurism of the Aorta treated by Ligature of the Left Carotid Artery": communicated in March, 1875 (a living subject).—Mr. Pugin Thornton, "On a Case of Tracheotomy in which the Operation was performed three times in the course of a few years" (a living subject).—Dr. Greenfield, "On a Case of Hydatid of the Lung."

VACANCIES.

Denbigh Infirmary.—House Surgeon. Salary, £35, with board. Must understand the Welsh language. Address the Chairman at the Infirmary.

Northampton Lunatic Hospital.—Assistant Medical Officer. Salary, £200, with board. Applications to the Medical Superintendent.

Kent County Lunatic Asylum.—Assistant Medical Officer. Salary, £150. Testimonials to Messrs. Beale and Hoare, Maidstone.

Dorset County Hospital.—House Surgeon and Secretary. Salary, £50, with board. Applications, under cover, to the Chairman at the Hospital, Dorchester.

Coventry Hospital.—House Surgeon. Salary, £100, with board. Applications, under cover, to the Secretary.

Maldon Union.—Medical Officer. Salary, £80, with fees extra. Apply to the Clerk of the Board, Maldon, Essex.

Gower Union, Swansea.—Medical Officer for the Eastern District. Salary, £20, with fees extra. Address the Clerk, Victoria Chambers, Swansea.

Stow-on-the-Wold Union.—Medical Officer for the Loughboro' District and Workhouse. Salary, £50. Also Health Officer, for which an additional £15 is given. Address the Clerk to the Guardians.

Westbourne Provident Dispensary.—Resident Medical Officer. Salary, £100. Applications to the Secretary, 24 St. Peter's Place, Bayswater.

APPOINTMENTS.

Brackenridge, D. J., M.D., F.R.C.P.Ed., has been promoted to Senior Assistant-Physician to the Royal Infirmary, Edinburgh.

Evans, D. T., M.R.C.S.E., Resident District Surgeon to the Pendleton branch of the Salford and Pendleton Royal Hospital and Dispensary.

Giffard, D. W., M.R.C.S.E., a Surgeon to the Brighton and Hove Lying-in Hospital and Dispensary for Diseases of Women and Children.

Hollingsworth, J. McKee, F.R.C.S.I., L.K.Q.C.P., Police Surgeon and Medical Officer to the A and D Divisions of the Leeds Force.

Marriages.

Saunders—Howie.—On the 1st inst., at St. Margaret's Church, Lee, Egerton Saunders, Surgeon, A.M.D., elder son of Dep. Insp. Gen. Saunders, M.D., R.N., to Serenah, second daughter of Thomas Howie, Esq., of Blackheath.

Weakley—Dring.—On the 3rd inst., at Emanuel Church, Upton, Essex, S. J. J. Weakley, L.R.C.P., M.R.C.S., of Stickney, Lincolnshire, to Rebecca Hannah, only daughter of Frances Dring, of Forest Gate.

Deaths.

Carey.—On Jan. 23, at Weston-super-Mare, Samuel Orby Carey, L.R.C.S.I., aged 36.

Christmas.—On Jan. 28, at the Grove, Hammersmith, Robert Dann Christmas, Surgeon, aged 46.

Graham.—On Jan. 21, at Dumbarton, William Graham, L.F.P.S.G., aged 43.

Norman.—On Feb. 1, at Manton, near Oakham, G. Blake Norman, M.R.C.S., late of Ilkeston, Derby, aged 76.

IRISH POOR-LAW INTELLIGENCE.

THE SUPERANNUATION PETITION.

Up to the hour of our going to press we understand that more than eighty boards of guardians, or one-half the entire number in Ireland, have signed the petition in favour of the payment of one-half the medical superannuation allowances from the Consolidated Fund, which was submitted to them by the Council of the Irish Medical Association, and was printed in our Supplement the week before last. Many of the boards have not yet had the subject under consideration, and we therefore anticipate the adhesion of at least two-thirds of the Unions.

ENNISKILLEN UNION.

IMPORTANT TO MAGISTRATES.

The Sanitary Sub-Officer reported in the case of the sanitary prosecution against Wm. M'Manus, Coa. The magistrates dismissed the case on the ground that the notice was not a *verbatim et literatim* copy of the report of the sanitary officer.

Chairman: I am afraid that the decision of the magistrates is a mistake, for the Sanitary Board can direct a prosecution without reference to the medical (sanitary) officer.

Mr. Graham: I think so too. It was not necessary to have a notice exactly in conformity with the medical officer's report.

Mr. Morrison: I am certain of it, for the Act does not require a notice at all. No notice was given originally, but I wrote to the Local Government Board asking one, and they prepared a form, but that notice is not recognised by the law.

Mr. Graham: The magistrates thought the notice should have been more specific.

Mr. Morrison: If the magistrates refused to convict on it, you might employ a professional gentleman and appeal.

Chairman: Should we conform to the wish of the magistrates?

Mr. Morrison: If you do you will make nonsence of the notice.

Chairman: The ground is, that the notice is not a *verbatim* copy of the medical officer's report. It seems to me, all the magistrates should desire to know is—is there a nuisance, and has the notice been properly served?

Mr. Morrison: There is no necessity for proving a notice at all. Evidence of the nuisance is all that is required. This notice of ours is simply courtesy and an addition to the Act, so that it is not at all necessary to be decided upon by the magistrates.

SCHULL UNION.—OUR SANITARY AUTHORITIES IN IRELAND!!

A letter was read from Dr. M'Cormack (forwarded to the Poor Law Commissioners), stating that he had attended to a small-pox case which occurred on board a vessel on her way from Liverpool to Mexico.

Mr. Hodnett: Where is the boy now whom Dr. M'Cormack attended to?

Clerk: I suppose he is on board the vessel.

Mr. Leahy: Where is the vessel?

Chairman: I suppose she has set out to sea.

Mr. Hodnett: *Perhaps that was no small-pox case.*

Mr. Sweetnam: *He may have no more small-pox than yourself.*

Mr. Hodnett: *I suppose the boy was vaccinated; but vaccination is only a catchpenny.*

Mr. Sweetnam: *I have been always of opinion that vaccination is a farce.*

THE PUBLIC HEALTH ACT.

A meeting of Town Commissioners in Ireland from towns of less than 6,000 inhabitants, to consider the working of the Public Health Act, was held in Dublin, pursuant to requisition. Deputations attended from Athy, Killiney, Wicklow, Fethard, Cashel, Newbridge, Tuam, and Trim.

The following resolutions were then unanimously adopted:—

(1.) "Resolved, that this meeting (composed of deputations from towns containing under 6,000 inhabitants) is of opinion that the Public Health (Ireland) Act, 1874, as far as it relates to such towns, would be more satisfactorily administered by Town Commissioners than by Boards of Poor Law Guardians, who are already overburdened with other business, and who cannot have the same local knowledge, nor as direct an interest, as Municipal Bodies, in whom the authority was formerly vested."

(2.) "Resolved, that inasmuch as the landlords of towns in Ireland where the Town Commissioners are, or hereafter may be entrusted with the administration of the Public Health (Ireland) Act of 1874, or any Acts incorporated therewith, are as much benefited by the due administration of such Acts as occupying tenants, we deem it just that the rates levied under the authority of those Acts should be borne equally by landlord and tenant; and that in future legislation there may be a clause inserted in any Bill introduced authorising the tenant to deduct from the landlord half such rates, as in the case of the Poor Law Acts."

(3.) "That the number of officers required by the Public Health Act, 1874, are, in our judgment, far too numerous, and that Town Commissioners, acting as the Sanitary Authority, shall have full power to employ their present officers as employés in carrying out the work to

be done, and that the Union medical officers, for economy's sake, shall fulfil the needful duty in such towns; and that such officers, in all such cases, be elected conjointly by the Board of Guardians and the Town Commissioners."

(4.) "That the present meeting be appointed a committee, with power to add to their number, and such committee to form a deputation to wait on the Chief Secretary of Ireland for the purpose of laying the foregoing resolutions before him; and that five do form a quorum."

ABBEYLEIX UNION.

THE FEES OF MEDICAL OFFICERS.

Mr. LODGE said Dr. Palmer had put forward a claim, or rather felt he was entitled to it, for his attendance in the vaccination prosecutions at the Durrow petty sessions.

Mr. Delany—I do not think he is entitled to any fee.

Mr. Lodge—I beg your pardon. He is entitled to a fee if he gave evidence in his own closet not to mind the court.

Mr. Delany—There is nothing in the act about it.

Mr. Lodge—But it is in the *Medical Press*.

Mr. Delany—That is not law. Where is the Act of parliament?

Mr. Lodge—The chairman of sessions has held that the doctor is entitled to a fee in such a case.

Mr. Lyster—But that would not make it law. The *Medical Press* is not legal evidence.

Mr. Lodge—It is only giving you what the barrister ruled.

Ultimately, it was agreed to take the opinion of the Local Government Board on the point whether the medical officer was entitled to a fee in such a case, and the matter dropped.

THE STATE OF THE WORKHOUSE.

The following communication was read:—

"Local Government Board, Dublin,
10th January, 1877.

"SIR,—I am directed by the Local Government Board to inform the board of guardians of the Abbeyleix union, that they have received Mr W. Hamilton's half yearly report relating to the union, in which he states that he concluded his inspection of the workhouse on the 5th inst., and that the infirmary continues to be kept in the same condition as previously reported by him with regard to nursing, clothing, bedding, cleanliness, and general want of comfort; and I am again to request the attention of the guardians to this subject, with a view to their taking steps for having the defects in this department remedied.

"Mr Hamilton further states that complaints were made to him during his inspection by three women in the nursery as to the rule in force respecting visits to the sick. One woman stated that three of her children had been sent to the fever hospital where one of them died, and that she had not seen any of them since their admission. Another stated that her young child was sick in the workhouse infirmary, and that she was only allowed to see it once; while a third woman, named Moore, complained that her infant, aged one year, had been admitted to the infirmary, and that she had been only allowed to see it twice a week, and that the child died on the 19th ultimo, on which day she did not see it until it was dead; and I am to request that the board of guardians will be good enough to give this matter their consideration.

"B. BANKS, Secretary."

Dr. Swan, who was in attendance at the board, said the charges made by Captain Hamilton were of a general rather than of a specific nature, which rendered their explanation the more difficult. With regard to the Inspector's report of a want of clothing and bedding in the infirmary, Dr. Swan denied that there was any want of bedding, though there might sometimes be a want of clothing. Captain Hamilton wished that persons might be allowed to visit their friends every day in the week; but if that were done the discipline of the hospital could not be maintained, nor would such a practice be permitted in any hospital in the three kingdoms. The charge that a woman was refused admission to the fever hospital, where one of her three children under treatment there died, was explained by the fact that under no pretence whatever were persons allowed to visit their friends in the fever hospital. The second charge contained in Captain Hamilton's report—that a woman complained to him of having a sick child in the infirmary, and been only allowed to see it once—could be easily replied to, as the child had been in the infirmary less than a week, and by the rules of the house, which limit visits to the infirmary to two days in the week, it could not have been seen more than once. The charge of the woman Moore, regarding the death of her child on the 19th ult., Dr. Swan explained by stating that the child died suddenly in the evening, although getting on well on the morning of her death; and that had he been aware of such a sudden change he would have given leave to the mother to see it. Even when people in the country had friends in the workhouse who became suddenly ill, messengers were immediately despatched to apprise them of the fact.

The Master said he told Captain Hamilton on the occasion of his inspection that if this woman had asked leave to see her child Dr. Swan would have granted it.

MONAGHAN GUARDIANS.

CASTLESHANE DISPESARY.

THE Clerk read a letter from the secretary of the committee to the effect that Dr. Donaldson, the medical officer was ill. Dr. Donaldson would be unable to resume his duties for a month, as another such attack would probably destroy his life. In these circumstances the committee had granted Dr. Donaldson a month's leave of absence. Dr. Donaldson had recommended Dr. Cranston, as a qualified practitioner to act for him during his illness. The committee had appointed him accordingly, and fixed his remuneration at £14 for the month, subject to the approval of the guardians.

A discussion ensued on the subject of the amount.

Mr. Rice thought £10 would be a fair remuneration, and even liberal under the circumstances.

Mr. Robinson said it would, provided the doctor had no expense; but he had to attend at the dispensary twice a week, and he would have to employ cars for that and visiting purposes.

The Clerk—He complains that he receives red tickets for parties who are not entitled to them.

Mr. Rice proposed that the remuneration be £10.

A division having been taken, the amendment was carried by a majority of one.

DROGHEDA UNION.

THE REGISTRATION ACT.

THE following was read:—

General Registrar Office, Dublin,
22nd Jan., 1877.

GENTLEMEN,—I beg to inform you that the office of Registrar of Births, Deaths, and Marriages, for the district of Stamullen, is now vacant, owing to the removal therefrom of Dr. Adrian. It therefore becomes my duty to request you will appoint a registrar for that district within 14 days, under the powers vested in you by the 26th Vic., cap. 11, sec. 23 and 25. I enclose herewith copy of the general rule.

I am, &c.,

HENRY WILKIE,
Chief Clerk.

Mr. Dowall—He wasn't aware that I had a duplicate key as superintendent registrar. I wrote to the office a

statement explaining the whole circumstances of the case, that he came in and explained how the key was mislaid, and that he wasn't aware that I had a duplicate key; I told them that the return would otherwise be sent off, and that if the matter was overlooked no inconvenience of the sort would arise again,

Mr. Gargan—I think we should ask Dr. Adrian to accept the office again.

Mr. Brabazon—And re-appoint him.

Mr. Dowdall—Will I communicate meantime with the office.

Mr. Gargan—You may say the guardians wish him to hold it.

Mr. Dowdall—After all it is not worth anything to speak of. The whole thing is not worth £3 a year to him, and he has the registration of the Fourknotts, Julianstown, and all that district to attend to.

COUNTY LOUTH INFIRMARY.

A meeting of the governors was held at Dundalk on Tuesday last, to elect a surgeon to the county Infirmary in the room of Dr. Brunker, resigned—when they unanimously elected Dr. Hercules Mac Donnell. B. A, T. C. D. M. Chir. and M. D., University of Dublin. Dr. Mac Donnell was also unanimously chosen as surgeon to the gaol.

KILCOCK DISPENSARY.

At the meeting of the Committee of Kilcock Dispensary district (23rd Jan. 1877), F. K. Coyne, L.R.C.S.I., L.K. and Q.C.P.I., and L.M., was unanimously elected Locum Tenens for three months, during absence of Dr. Wade through illness. There were five other candidates seeking appointment.

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING JAN. 27, 1877.

Total registered deaths in Dublin and suburbs *		...	178
Ten years average of same week	... ...	...	208
Decrease of mortality below average	... ...	...	30
Ratio of deaths, suburb of Rathmines	...	29·2	per 1,000
" " " Donnybrook†	...	23·4	"
" " " Blackrock	...	14·4	"
" " " Kingstown	...	30·9	"
" " Entire Dublin district	...	29·4	"
Comparative Ratios—London	... ...	20·1	"
" " Glasgow...	...	25·6	"
" " Edinburgh	...	21 6	"

* District extends over 10,050 acres, and contains 314,66 persons.

† This district includes City of Dublin and Incurable Hospitals.

The number of deaths from zymotic diseases registered during the week is 29; average number in the corresponding week of the previous ten years 38·2. The deaths from these diseases returned last week include 1 from small-pox (that of a woman who was admiitted into the Mater Misericordiæ Hospital from "Howth Road") 8 from fever (3 typhus and 5 enteric fever), 4 from scarlet fever, 2 each from measles, diphtheria, whooping-cough, and erysipelas, 1 each from influenza, diarrhœa, &c.

Fourteen children died from convulsions.

Bronchitis caused 24 deaths, pneumonia 8, asthma 2, and lung disease unspecified 4.

Seven deaths resulted from heart disease, 2 from aneurism, 6 each from apoplexy and paralysis, 1 each from cephalitis and epilepsy, 5 from brain disease unspecified; 2 from liver disease, 2 from Bright's disease, and 3 from kidney disease unspecified.

Seventeen persons died from phthisis, 4 each from scrofula and mesenteric disease, 2 from hydrocephalus, and 8 from cancer.

Six accidental deaths were registered, viz., 3 from fractures and contusions, 2 from burns, and 1 from drowning.

Eight deaths from whooping cough, 6 from measles, 2 each from scarlatina and diarrhœa, and 1 each from fever and diphtheria were registered in Belfast during the week.

LIST OF ENTRIES IN THE REGISTER OF THE BRANCH MEDICAL COUNCIL (IRELAND) FOR THE MONTH OF JANUARY, 1877.

January 2nd.—Maguire, Daniel, Doonflin, Skreen, co. Sligo, Lic. Fac. Phys. Surg. Glas. 1876.

3rd.—Reynolds, George Gerald, 52 Upper Leeson Street, Dublin, Lic. R. Coll. Surg. Irel. 1876.

8th.—Flood, John Wellesley, 69 Pembroke Road, Dublin, M.B. Univ. Dub. 1876, Lic. R. Coll. Surg. Irel. 1876.

9th.—Elliot, Henry George, 26 Ellison Street, Gateshead-on-Tyne, Lic. R. Coll. Surg. Irel, 1876.

9th.—Crofts, Aylmer Martin, Rohavne Court, Roches'own, Cork, Lic. R. Coll. Surg. Edin. 1876, Lic. R. Coll. Phys. Edin. 1877.

15th.—Anderson, Charles, Cantybrindle, Ballinamallard, co. Fermanagh, Lic. R. Coll. Surg. Irel. 1876, Lic. 1876, and Lic. Mid. 1876 K. Q. Coll. Phys.

16th.—Conry, Walter, 9 Charleston Terrace, Rathmines, co. Dublin, Lic. R. Coll. Phys. Edin. 1875, Lic. R. Coll. Surg. Edin. 1875, M.B. Univ. Dub. 1876.

17th.—Farrelly, Patrick William, 21 Claverton Street, South Belgravia, London, Lic. Apoth. Hall Dub. 1875.

17th.—Nelis, James Alexander, 2 Park Villas, Stillorgan Park, Blackrock, co. Dublin, M.B. 1876, and Lic. Surg. 1876 Univ. Dub.

22nd.—Elmes, Robert Rosborough King, Browood, Staffordshire, Lic. R. Coll. Surg. Irel. 1875, Lic. 1876 and Lic. Mid. 1876 K. Q. Coll. Phys. Irel.

30th.—Brodie, James Fitzgerald, Palmyra Terrace, Galway, M.D. 1876 and M.Ch. 1876 Q. Univ. Irel.

31st.—Blunden, William, Castle Blunden, Kilkenny, M.B. Univ. Dub. 1876, Lic. R. Coll. Surg. Irel. 1876, Lic. Mid. K. Q. Coll. Phys. Irel. 1877.

31st.—Jefferson, James Graham, Lisburn, co. Antrim, Lic. R. Coll. Phys. Edin. 1876, Lic. R. Coll. Surg. Edin. 1876.

EXTRACTS FROM REGISTRARS' NOTES.

For the Last Quarter.

(Continued.)

Naas; *Rathmore.*—The filthy state of the pump at Kill, and the want of water in the village of Kilteel, have not yet been remedied. It is just two years since I first brought these matters under the notice of the sanitary authorities, and I have since then made five additional reports on the same subject. I am informed the attention of the Board of Guardians has been called to the subject by the Local Government Board, in consequence of a report from the Poor-law inspector.

Rathdrum; *Rathdrum, W.*—I always found it was next to an impossibility to make the cabin keepers of small towns and villages clean or have them believe that manure kept about their premises was prejudicial to health.

Athlone; *Athlone*, No. 2.—I find no difficulty in making the people in the country act in accordance with the sanitary regulations, but cannot say as much for the townspeople.

Cootehill; *Cootehill, W.*—I am of opinion the entire deaths are not registered in the district, nor will it be perfect until the graveyards are registered, which will make it simple.

Monaghan; *Glaslough.*—In the Register of deaths for this quarter, a female is registered who reached the very advanced age of 108 years. She took her breaktast with relish and was walking about the day of h

The Properties of Squills.

According to Dr. Huseman, in the *Med. Wochenschrift*, this drug, in the form of an extract, such as is employed in the German pharmacopœia, has a very constant action on living animals. It affects the innervation of the heart, and the muscles of the heart, exactly in the same way as do digitaline, antiarine, and those other alkaloids which are especially known as cardiac poisons. The diuretic action of squill can only be explained by the increased blood-pressure which it induces by its influence on the heart, since no other organ is acted on by it, and it does not produce any manifest irritation in the kidneys during its elimination. The indications for and against the use of squill in the different forms of dropsy are almost exactly the same as in the case of digitalis. Extract of squill has no expectorant power due to its elimination by the bronchial mucous membrane, nor has it any antipyretic power; on the contrary, its exhibition produces a greater or less elevation of temperature.—*Med. Surg. Reporter.*

Relative Value of Cinchonidia and Quinia.

New Remedies.—As the result of experiments instituted in the Bellevue Hospital, New York, with the view of determining the above question, it was established that, in all purely medical affections, such as intermittents of all stages, pneumonia, &c., whenever the tonic effects of cinchona are desired to be produced, cinchonidia can, with perfect reliability, be substituted for quinia, although its action is not so prompt, and it requires a slightly larger dose. The difference in the expense of the two articles must be borne in mind. It is *totally inadmissible* in cases of *severe surgical injuries*, especially those affecting the quinto-urinary organs, and in cases of shock, when it is apt to produce emesis, and, in connection therewith, severe congestive symptoms.

To Destroy Warts.

New Remedies.—Mr. Frank Parker, of Mineral Springs, Cork, says that a drachm of nitrate of silver dissolved in an ounce of nitro-muriatic acid makes a solution which, applied to warts with a fine brush, will permanently cure them in a few days.

POISONING BY GELSEMINIUM.

The *St. Louis Eclec. Med. Journ.*, and *N. Y. Journ. of Materia Medica*, recommend the following in cases of gelseminium poisoning.

℞. Carbonate of ammonia, 1 drachm;
Water, 2 ounces. Dissolve.

Dose.—One teaspoonful every hour. Give also one-tenth of a grain of sulphate of strychnia in an ounce of brandy every two hours, until four doses are taken, when it is to be discontinued. The ammonia and brandy should be continued until the toxic effect of the gelseminium is subdued.

The hypodermic injection of whisky is also asserted to act as a corrective to the toxic effects of an overdose of gelseminium.

INFLUENCE OF FORESTS ON OZONE.

In a note by M. L Fautrat, in the *Bulletin Hebdom.*, No. 475, of the Scientific Association of France, it is shown from observations made at Halatte and Ermenonville, that less ozone was observed in forests, particularly forests of pine, than in the open country, and more ozone at a height of 46 feet above the ground than near the surface. This statement goes far towards corroborating the opinion expressed by Mr. Kingzett in his paper on "Nature's Hygiene" (vide *Pharm. Journ.*, No. 366), that plants do not produce ozone, but peroxide of hydrogen, and that the hygienic influences attributed to the pine and eucalyptus (the oil of which has been shown by Faust and Homeyer to consist mainly of a terpene and cymene $C_{10}H_{16}$ and $C_{10}H_{14}$) are due to this latter agent, for the fact has been established beyond doubt that all bodies of the chemical formula $C_{10}H_{14}$ or $C_{10}H_{16}$ give by atmospheric oxidation, peroxide of hydrogen, and *never* ozone. The following and other substances have been examined in reference to this matter, and the observation holds good in every case—turpentine, hesperidine, myristicene, wormwood-oil, cymene, menthene, &c.

ON THE ELECTRO-MOTIVE PROPERTIES OF MUSCLE. (a)

By J. Burdon-Sanderson, M.D., F.R.S.

It has long been known as regards the living animal body that the only tissues which are electromotive are the nervous and muscular. All others behave, so far as has been ascertained, as ordinary moist conductors. Investigated electroscopically they exhibit, so long as they are in the living state, no variation of potential. In the plant it is the same. An ordinary stem of a herbaceous plant has the same potential as the soil in which it grows, or exhibits such trifling variations that it may be said to be constant. In most of the innumerable researches which have been made in the domain of animal electricity since the early discoveries of Du Bois Reymond, the method has been adopted of comparing the electrical state of the part to be investigated not with some other part of the organism outside of the area of electrical change, and therefore possessing in relation to such change a constant potential, but with some other part of the electrically active organ itself. Thus, in the case of muscle, the cut surface has been compared with the natural surface, the tendon with the muscular surface, &c. These considerations led us to begin our investigation by comparing those parts of the leaf of *Dionæa*, which appear to be the seat of electrical change, not with other parts of the same organ, but with the earth or with some other part of the same plant which we had previously ascertained to be electrically indifferent and constant, *i.e.*, free from electrical vicissitudes. The way in which this was carried out will be explained in the next section.

The greater number of the observations were made at Kew during the month of August of this year, the plants being obtained from the hot-houses of the Royal Gardens, through the kindness of the director, and brought to a conservatory in the house in which one of us resided several days before they were used. The parts to be compared were connected with the electrometer by means of electrodes of the same construction as those which we always employ for electro-physiological purposes. Each consists of a V-tube supported by a convenient holder, and half filled with saturated solution of zinc sulphate. Into one arm is plunged a zinc rod, of which the immersed end is amalgamated into the other, a glass tube filled with kaolim made into a paste with 0·75 per cent. solution of chloride of sodium. The upper end of this mass of clay forms a cushion, which can be moulded to any required shape. Electrodes of this form are convenient to work with, and possess manifold practical advantages, the greatest of all being (1) the facility with which they can be renewed in case they are found (by testing with the galvanometer) to exhibit polarity, and (2) the facility with which they can be brought into any desired position.

The arrangement most usually adopted is as follows :— The pot containing the plant had been previously kept plunged in water. Three electrodes are used, by one of them (called the fixed electrode) the damp surface of the pot is connected with a gaspipe. The other two (called movable electrodes) are in contact with any two surfaces of the leaf which it is desired to investigate. By means of a switch either can be brought into connexion with the larger mercurial surface of the electrometer. The capillary surface is connected directly with the earth. In many of the experiments the capillary surface was connected directly with the fixed electrode.

In experiments, of which the results were communicated to the Royal Society in 1873, it was found that the passage of induction shocks in rapid succession (faradization) through the tissue of the leaf in the immediate neighbourhood of the external surface of a lobe, produced effects which resembled those which follow mechanical excitation. It also appeared that this mode of excitation was exhausting; for although a leaf could be excited at 2 minutes' intervals for an hour or two without any appreciable impairment of its excitability, it soon ceased to respond when excited very frequently.

(a) Read before the Royal Society.

During the last summer we have confirmed these observations, using not only faradization but single induction-shocks. For both purposes we have found it convenient to employ as exciting electrodes steel needles sheathed in glass and bound together so that their exposed points were about a millimeter apart. These points were thrust through the epiderms of the leaf either on the internal or external surface.

For the production of single closing shocks the primary circuit of Du Bois's induction-apparatus (that of a single Daniell) was closed at regular intervals by a Donder's fall-apparatus (a modification of Pflugers') the opening shocks being suppressed by a suitable contrivance. The experiment was begun with a fresh leaf, and with the secondary coil at a distance of from 15 to 20 centims. The electrometer indicates that there was no effect, the distance was gradually shortened until the electrical disturbance took place. The excitation was then repeated at minute intervals until the leaf ceased to respond. It was always found that it was necessary to push up the secondary coil to within a couple of inches of the primary—in fact, to use induction-currents of such strength as would be sufficient to awaken reflex action from the cutaneous surface of the frog. There was an appreciable delay between the passage of the induction-shock and the electrical disturbance which resulted from it, a delay of which the duration varied according to conditions to be discussed in the next section.

When a leaf is excited at minute intervals, or oftener, by closing shocks which are of just sufficient intensity to produce a response, it invariably happens that after a time the effect ceases, *i.e.*, that the mercurial column remains motionless. The effects can, however, be reproduced either by shifting the needle points to a new spot or by diminishing the distance of the secondary coil. The same result can be attained without interfering either with the coil or the electrodes, by allowing the leaf to rest for a longer interval.

We next proceed to compare the effects of single shocks with that of faradization. The difference is striking. If the same experimental method is employed as before, with the exception that each excitation consists of the passage through the tissue, not of a single induction-shock, but of a rapid succession of such shocks, in alternately opposite directions, it is found that an effect is obtained with currents of relatively small intensity, so that if the experiment is begun with the coil at twenty centims. distance, and pushed up a centimeter at a time, the leaf begins to respond after one or two approximations.

This observation appeared to us to indicate plainly that, with relation to stimuli, the excitability of the leaf resembles that of the terminal organs of the higher animals, with reference to which it has been lately ascertained that they can be so excited as to awaken reflexes by relatively feeble electrical stimuli, if applied at very short intervals and repeatedly. We therefore proceeded to make experiments in which each excitation consisted of a definite number of induction-shocks in rapid succession. The results were in accordance with our expectations. It having been ascertained that with the electrodes in a certain position a single instantaneous contact had no effect when the secondary coil was at seven centims., but was followed by an excursion when it was pushed into 6 5 centims., it was set once more at seven centims. Again, a single contact was without result; two such contacts at one-fifth second intervals were also futile ; but after three contacts there was an excursion. This experiment having been several times repeated, the coil was pushed back to eight centims., and successive experiments were made with series of two, three and four contacts at one-fifth intervals, which were in each case without effect. After five contacts, however, there was an excursion. On now interposing the vibrator of the induction-apparatus, of which the rate of vibration was thirty per second, it was found that an excursion was readily produced at a distance of eleven centims., thus showing that the feebler the excitation, the more frequently must it be repeated, in order that a result may follow.

These facts afford the key to the understanding of the phenomena when the leaf is excited at short intervals by faradization, the excitation being continued each time until an excursion is produced. When this phase is adopted we have the opportunity of observing the combined influence of summation and of gradually increasing exhaustion. At first the leaf responds after eight or ten excitations, and a series of results present themselves quite analogous to those related in the preceding paragraph ; but as the tissue immediately surrounding the electrodes loses its excitability, the number of excitations required to awaken it to action rapidly increases, the effect being postponed for longer and longer periods until it finally fails to occur.

The result may be thus interpreted. Each excursion is an effect to which each of the induction-shocks which precedes it contributes. At first the summation is rapid ; for the tissue traversed by the currents is still prompt to enter into that molecular change of which the excursion is the visible sign. As this promptitude to change or, as it might be called, explosiveness, diminishes, the number of individual stimuli required in order to bring about the discharge becomes rapidly larger and larger, until at last the result is indefinitely postponed.

When a leaf is excited at regular intervals by single shocks of such intensity as to be just beyond the limit of adequacy, so that the slightest diminution would render them futile, it is sometimes observed that the effects become rhythmical. Thus, in a series of fifty-four successive excitations at half-minute intervals, we obtained the following results :—Excitations one, two, three, and four were effectual ; but of the sixteen excitations following, every other was futile, the alternate ones being followed by excursions ; then followed during eight minutes a series of futile excitations, after which the leaf was allowed to rest for two minutes. On resuming, the alternate rhythm again appeared for six excitations, then becoming modified so that an excursion followed every fourth instead of every third excitation, a state of things which continued for a quarter of an hour. In other instances the same tendency showed itself, but less distinctly, the usual result being (as has been already stated) no further effect was produced so long as the same spot was acted upon by currents of the same intensities.

The fact that by changing the seat of insertion of the needle-points the excursions could at any time be reproduced we regard as of importance, as showing that the excitability of the plant is a property possessed, so to speak, independently by the protoplasm of every cell in the excitable area. When, after repeated excitations at any particular point, effects cease to manifest themselves, their absence denotes, not that the whole leaf is exhausted (for if it were so, change of insertion would not renew them), but merely that the excitability of the tissue in the immediate contact with the needle-points has been blunted.

Influence of Temperature.

The conspicuous analogies which, throughout our investigations, have presented themselves between the phenomena of excitation in the leaf, and those which occur in nerve and muscle, rendered it of great importance to ascertain whether those physical agents which are known to exercise a decisive influence on the excitation process in animal tissue have a similar influence on that in the plant. This subject we propose to investigate more fully next season. In the meantime we submit the results of two experiments, either of which would be sufficient to show that the influence of temperature on the plant corresponds completely with what is known as to its effect on the contractile tissue of animals.

In each case a leaf, which for this purpose was necessarily detached from the plant, was investigated at the ordinary temperature of a room, then placed for twenty

minutes in a chamber warmed to 45° C., and then cooled by placing a block of ice in its neighbourhood. The results of the chronometrical comparison of its condition, under these circumstances, are as follows :—

Experiment 1.

Time, in Seconds, after Excitation of

	Beginning of excursion	Maximum of excursion	End of excursion
Leaf at ordinary temperature, 18°-20° C. . .	0·22	0·86	
After 10 min. in chamber	0·97	0·51	
After 22 min. in chamber	0·92	0·42	
Cooled 5 minutes . .	0·29	0·92

THE DUBLIN ORTHOPÆDIC HOSPITAL, A BRIEF ACCOUNT OF THE PRACTICE PURSUED THEREIN. (a)

By Robert Lafayette Swan, F.R.C.S.
Lecturer on Anatomy in Steevens' Hospital Medical School.

An hospital for the practice of orthopædic surgery has been for some time in operation in this city, and I think it right in this place to give some account of its formation and the practice pursued therein.

The reasons which acted as the motor power in the origination of the idea of forming such an Institution were not a few, and I shall here endeavour briefly to recount them. I must first, however, state that those reasons did not consist in there having been heretofore a lack of orthopædic practice, or surgeons who successfully relieved crippled humanity in this city by their skill and ingenuity in that special branch. The hospital records of Dublin demonstrate that the efforts of Adams, Stapleton, Elliot, Cusack, Tufnel, and many others, have maintained the advancement of this branch of surgery in Ireland.

But without an exception, every hospital surgeon with whom I have conversed on the subject, has confessed that the difficulties in the way of the treatment of even one of the commonest varieties of deformity, club-foot, in a general hospital were always great and sometimes insurmountable. In the first place, the onerous duties of a large surgical hospital will scarcely always admit of the constant watching and drain on time which a single case of this nature demands. The dependence also on the punctuality of instrument makers, and I may state the frequent difficulty in procuring appliances in this city, all create obstacles which often test the patience and temper of the surgeon.

Again, in a surgical ward, where diseases and accidents of more fatal importance are paramount, a young child is seldom left without some female relative to tend it. Such a person, usually the mother of the patient, whether induced by other ties at home, or becoming weary of the monotony of an hospital, soon, taking into consideration the tediousness of the treatment, removes the child from under the surgeon's care, and thus the labour of months often goes for nothing, or indeed, proves an obstacle to subsequent treatment, which, however, is seldom attempted, as the parents have lost their faith in interference, which they themselves have caused to be abortive. Such a result is unlikely to occur in an orthopædic hospital, where nurses are specially retained for tending young children, and the presence of the parent is unnecessary. Such causes, terminating through no fault of the surgeon, in either partial success, or in a relapse after a completely successful issue, have engendered an apathy in the minds of many of the least educated classes in this country in reference to this subject. They regard as irremediable fatalities such affections as spinal curvature, club-foot, and other deformities; and in many cases, are content to allow their offspring to grow up miserable and helpless themselves, and objects to others of pity or contempt. To meet the immediate requirements of this class, there has certainly heretofore been in Dublin no plain remedy. Amongst the profession, the Whitworth Hospital, Drumcondra, has been known as an Institution where orthopædic surgery was practised, but solely from the reputation acquired in this department by its visiting surgeon, Dr. Elliot. Its published prospectus, however, in no way refers to this subject, but runs as follows :—

"This hospital is open for the reception of patients labouring under general, medical, and surgical complaints. No cases of fever or any other contagious diseases are admitted. The dispensary in connection with the hospital is open on the mornings of Monday and Friday for medical patients, and on Tuesday and Saturday for surgical cases, from ten till eleven o'clock."

Many of our noblemen and landed proprietors in this country are governors of the Royal Orthopædic Hospital, Oxford Street, London. From this circumstance, the fact may be deduced that in a period of one month, I observed four cases, two of spinal curvature, and two of talipes sent over from this country for treatment. In the Dublin Orthopædic Hospital, which up to this time has been generously supported by the merchants and gentlemen of Dublin and many of the counties, amongst which may be particularly mentioned those of Limerick, Cork, and Kilkenny, we have at present but eight free beds. The average expense, however, of each case for instruments and appliances on leaving will amount to nearly £10. This, if we turn out two cases annually from each bed, leaving £30 per annum as its standing cost, will give an average of £50 per bed per annum.

In the Royal and National Orthopædic Hospitals, except in a few cases supported by endowment, the sum of ten pounds is deposited by each applicant before admission is granted. This sum, I am informed, is collected in England, when the parents are poor, by the sympathising assistance of their neighbours. I am convinced that in Ireland, now that grinding poverty has left the land, this principle of self-help only requires cultivation. We have also a certain number of beds set apart for paying patients. It has been decided by our committee that in no case shall they be filled unless with the concurrence and subsequent co-operation of the medical attendant of the patient. They have considered that there are already too many methods of encroachment on the private revenue of the profession.

Regarding the principles of treatment pursued, I will not, sir, weary the Society by recounting well known facts, or by a recapitulation of those conjectural doctrines little worthy of repetition. I shall merely trespass so far as to give a very brief outline of the means adopted as a general rule by us for the relief of three very common varieties of deformity; namely, curvature of the spine, rachitis, and talipes. Spinal curvature, for the application of treatment, may be divided into two varieties, antero-posterior and lateral. The first of those may be subdivided into angular, the result of caries, and into that exaggeration of either the dorsal or lumbar curve, consequent on relaxation of the ligamentous and muscular structures, in which no caries of the bone exists. As, however, this form of curvature is often seen in rachitic subjects, it is not unlikely that a pathological change in the bodies of the vertebræ may

(a) Paper read before the Surgical Society of Ireland. The discussion will be found on page 127.

increase it. In the first variety, or angular curvature, perfect rest in the horizontal posture is adopted. This is enforced by the application of a well-fitting padded splint, embracing shoulders, pelvis, and the entire dorsal surface on which the patient rests until a cure is effected by ankylosis. In reference to this treatment as distinguished from the ingenious deduction of Pott, that suppuration should be induced because nature pointed out that it gave relief, I cannot omit quoting the following statement of Mr. Brodhurst:—

"The importance of this fact (perfect rest in the recumbent position) cannot be too much insisted on. Without it all other treatment is useless. I have never known an abscess to form when the treatment has been strictly carried out; but on the other hand I have often known an abscess to be absorbed when the recumbent position has been strictly maintained." The formation of compensating curves will show, when the erect posture may be resumed, of those the inferior kind generally first appeared. Their formation is usually completed in eight or ten months. Lateral curvature may be divided into primary and consecutive. The pathology of the primary form is analogous to that of the posterior curvature already alluded to. Its treatment requires no comment. That variety of lateral curvature dependent on a remote cause is more obscure in its diagnosis. I may here mention an affection by which my attention has been forcibly arrested recently as a frequent cause of lateral curvature: I allude to valgus. Here we have a series of compensating curves implicating the vertebral column, pelvis, knee, and tarsus; and it is interesting to trace the deformity to its source. The treatment in such a case is obvious; a restoration of the arch of the foot by a valgus sole-plate, with perhaps an outside stem and ankle-strap, will probably cure the affection.

The surgical treatment of rickets requires in the abstract but a few words. In all cases, before nature has produced a consolidation of bone, and a deposition of additional material to strengthen a distorted limb, the careful application of gentle pressure will restore symmetry. When, however, this period has elapsed, it requires very violent measures to rectify deformity; in other words, the application of immense force is necessary to fracture the distorted bones. How far this forcible treatment is justifiable is a question. Regarding the treatment of talipes, under which head I will include all distortions consequent on irregular muscular contraction or combined with contraction of fibrous structures, after an observation of the practice and results in London and on the Continent, and the various opinions held on the subject, we are inclined to follow the course exclusively adopted in the Royal Orthopædic Hospital, London. There they divide tendon or fascia, as required. The limb is maintained in the position of the original deformity by means of a padded and pliable metal splint, for a period of four or five days after operation, until the incision in the integuments is healed, and a newly organised structure thrown out before a stretching apparatus is applied.

I have observed that few London surgeons regard Mr. Barwell's method of treatment as satisfactory, although I am aware the Mr. Sayre in America, and more than one Parisian surgeon, speaks highly of this practice. I take this opportunity of expressing my thanks to Mr. Brodhurst, Mr. Reeves, and the other surgeons of the Royal Orthopædic Hospital for their extreme kindness, affording me as they did every facility for observing the practice of the hospital.

I have the honour, sir, to lay before the Society, a modification of Scarpa's shoe, with which I may state I have obtained extremely satisfactory results. In equinovarus, as may be easily observed, and which I can illustrate in these (exhibits dissections) dissections made by my colleague Dr. Bookey, three distinct deformities exist. Firstly, elevation of the heel occurring at the ankle-joint, from the gastrocnemii. Secondly, adduction; and thirdly, rotation in the axis of its anterior segment, occurring at the median joint of the tarsus, from the combined action of the anterior and posterior tibial muscles. The movements for remedying the first and second distortions are not original, but that for the third, which rotates the sole in the axis of the foot, I have not before seen, and I think its application will facilitate the treatment of that deformity.

In conclusion, sir, we are aware that the success of our infant Institution will in a great measure depend on the estimation in which it is held by the profession. They naturally sway the public in such matters. We earnestly solicit their support, in order that it may attain a full growth.

SOME PRACTICAL REMARKS ON AURAL AFFECTIONS.

By H. Macnaughton Jones, M.D., M.Ch., F.R.C.S.I. and Edin.,

Surgeon to the Cork Ophthalmic and Aural Hospital, with Special Throat Department.

(*Continued from page* 101.)

Hereditary Influences.—The history of deafness in the family should especially be inquired into in those cases where the difficulty of hearing comes on without any assignable cause, and where there is no marked abnormal condition to account for the malady. That deafness "runs in" certain families is well known, and this hereditary tendency (apart from such affections as gout and syphilis) will throw light on many cases in which the cause is obscure. I have just at present a lady under my care who is very deaf, and whose mind is beginning to fail. She is one of a family, two other members of which are deaf. Deafness has been transmitted for generations; and, coincident with the deafness, there is also a family history of insanity. Gout is perhaps the most mischievous heirloom. It may produce its effects at any age, and these are often most insidious, but those cases that I have seen were all over the age of thirty. I have noticed the coincidence of exostoses of the external meatus frequently in gouty patients, and in those in whose family there has been a history of gout. Hinton drew attention to a peculiar "irritability of the meatus attended by slight serous or sticky discharge, with itching or pricking pain, the walls being somewhat swollen and having a tendency to purple in their redness" as a form of gouty affection. This I have many times seen.

In January, 1871, a gentleman consulted me for deafness in the right ear, the left being hopelessly deaf for many years. He could not hear the tuning-fork louder in either ear on closure. The watch was heard at one inch with the right ear, the nail at two-and-a-half feet. He never had discharge or pain, and never had any noises. The external meatus was narrowed and contracted from small exostoses, and the membrane was thickened and vascular. There was occasional sense of fulness and throbbing. The sound with the otoscope was abnormally moist. He had consulted Mr. Hinton in 1869, and I had several communications with him about this case, in which he took a great interest. Both ears were much in the same condition. The appearance before referred to—viz., a moisture and packing up with epithelium. Mr. Hinton regarded the case as of a gouty nature. The patient was always relieved by iodide of potassium and gouty remedies, the employment of the douche and of injections of iodide of potassium into the middle ear, and careful attention to the external meatus. The last time I saw him, he was considerably and permanently benefited.

In 1870, a gentleman (age 60) consulted me for deafness, arising from a condition much the same as that described in the last case. The exostoses were perhaps larger. He had become gradually deaf, and was perhaps worse in one ear than the other. He never had suffered from gout himself; his grandfather and father both died from the

effects of gout. Other members of his family are greatly afflicted by the same malady. He was convinced that his condition proceeded from the same cause, and, doubtless, he was correct. Nothing improved him.

In 1873, a gentleman (age 40) consulted me for extreme deafness in both ears. There was a gouty history and a gouty family. He lived always well, and indulged pretty freely in alcohol. The meatus of one ear was almost completely occluded with an exostosis, and there was a similar condition, though less in degree, of the other. Under treatment directed to reducing the congested condition of the meatus by frequent cleansing with astringent injections, and attention to the cavity of the tympanum, with constitutional remedies, he improved considerably before he passed from my care.

Present Symptoms. PAIN.—Pain, more or less violent, is present in all acute inflammatory affections of the ear. For instance, it is, as a rule, very acute in ordinary furunculous abscess of the meatus, in acute perforation of the membrana tympani, and in acute inflammation of the same. Pain, under any of these conditions, may produce a state bordering on delirium, so wild and fierce may it become, especially at night. So, also, the constant deep throbbing pain, when mischief has extended to the internal ear, is peculiarly intense and most difficult to relieve. This latter pain, in those cases which I have seen, is characteristic as radiating over the side of the head and is often accompanied by frontal ache and great intolerance of light. In children, especially, is the occurrence of pain of importance, as it is often the only guide to the malady from which the little one suffers; the carrying of the hand to the head and the affected ear drawing the attention of friends and physician, long before the occurrence of discharge, to the seat of the mischief. But in many cases it is surprising what an abnormal condition of things may exist without the occurrence of pain. Constantly we see persons with evidence of long-standing disease, as exostosis of the meatus, polypus, thickening of the membrana tympani, or even perforation of the same, and thickened states of the membrane of the cavity of the tympanum, or ankylosis of the ossicles, all lesions of a chronic character in which no pain has been complained of, and in which patients deny its existence. Some of the most intractable forms of deafness, with nervine complications, are those in which there never has been from first to last any pain. The presence of pain is of value chiefly in showing the acute nature of the attack, and (excluding causes existing in the meatus) it will point to inflammation of the membrane, and if there be no appearance of such, to mischief in the cavity of the tympanum or in the internal ear. The advent of acute pain in an old-standing case of aural disease, where there is not any manifest cause for its occurrence, should always be looked on with suspicion, the more especially if such be accompanied by any general constitutional symptoms, such as rigors, vomiting, alterations in the pulse, constipation, or drowsiness. Pain in the ear under any circumstances should both in old and young receive immediate attention, and its source be carefully ascertained.

DISCHARGE.—The history of a discharge, the length of time it has lasted, and the states which preceded its occurrence, the fact of its being coincident with pain or relieving it, its nature, if mixed with epithelium and mucus, its quantity, should separately be inquired into. It is well to see if there is any foul smell, and if the discharge be mixed with blood. One clear rule should be always observed—namely, to regard discharge from the ear as but a symptom of some diseased state of the auditory passages, and one which must be dealt with only after ascertaining its exact source. Nothing can be more mischievous than to regard the mere discharge as the disease, and to remain satisfied with undivided attention to it without arriving at a correct conclusion as to the cause of this symptom. Frequently, I have seen polypus, perforation of the membrane, destruction of the ossicles in cases treated as "otorrhœa," and these serious complications overlooked from neglect of the simple precaution of examining an ear carefully with a speculum when the discharge has been all removed. As a diagnostic symptom, discharge is valuable by directing our attention specially from the external meatus to the membrane and the middle ear, the constant sources of its presence.

SYPHILIS.—In children the fact should not be forgotten that transmitted syphilis is a frequent source of ear mischief. It is difficult to say when the morbid changes which bring about this terrible form of deafness commence. Struma and syphilis have both their share in producing aural complications in young children. But while frequently to the former are attributed the symptoms which are observed in the young child and infant, the presence of the latter is overlooked. In many obscure cases, where there is no proof of the parents being strumous, and no appearance of a strumous diathesis in the child, the search must be cautiously but carefully made for a syphilitic origin. More particularly is this necessary in those acute cases which we occasionally meet when a child or young infant is attacked rapidly with inflammation in the middle ear, followed by profuse otorrhœa, and perhaps convulsions and death. In such a case that I saw lately there was general blood-poisoning and collections of pus formed in different parts of the body; the attack was ushered in with snuffles and an abscess over the antrum. The father had syphilis, and the previous children had all died shortly after birth. Suspicions must be awakened by such a history, and it should not be overlooked, both for the sake of the patient and the surgeon. But those cases are most frequently met with in which the deafness is hereditary, and the child has never heard well, without any history of discharge, and when there has been no complaint of pain. These children are not brought in the earlier years of childhood, and we are often not consulted until the growing deafness has become so inconvenient, at or about the age of puberty, that the parents, particularly amongst the poorer classes, are forced to get advice. The symmetrical nature of these cases, as pointed out by Mr. Hutchinson, may assist in the diagnosis. The presence of the characteristic teeth, also described by him, the coincidence of syphilitic lesions of the cornea, the proofs of old skin affections, and the general characteristic appearance with which we become familiarised on seeing a number of such cases, will confirm the diagnosis. We have Hinton's testimony that one-twentieth of the cases of deafness attending Guy's Hospital had as their cause hereditary syphilis. This proportion has certainly not been nearly so great in the cases under my care. This, of course, would be accounted for by the greater prevalence of inherited syphilis in such a city as London. These three cases are typical of the hereditary syphilitic class, and therefore I refer to them here.

Mary A., orphan, age 18. Could trace no family history. Has always been deaf; barely hears the watch on contact with left ear; altogether deaf with right. There has never been any pain or discharge. Cornea of both eyes is dull. There is a peculiar nasal voice, and difficulty in pronouncing some words. The external meatus of both ears is healthy; the membrana tympani of both is very concave, and dull, with a prominent malleus. Eustachian tubes are free. She hears a tuning-fork well in both ears when placed on the head, the sound becoming duller on closure of the ear; tonsils congested, teeth normal.

A. M. H., female, age 15. Her father, who is dead, was affected with deafness. She has been deaf since childhood, and the deafness has greatly increased of late. The cornea of both eyes is dull, and old interstitial deposits exist. Hearing apparently almost completely destroyed, neither hearing loud noises nor conversation in the loudest tones. External meatus healthy; membranes extremely concave and dull, with marked pockets; Eustachian tubes closed. Has the same peculiar lisp and difficulty of pronunciation as in last case. Teeth partially syphilitic and discoloured.

Miss —, age 15, consulted me, November, 1874, for old

interstitial keratitis. She was the first child not still-born of the family; all the previous children were syphilitic. She has also now slight deafness and typical syphilitic teeth. Her eyes were healthy until she was five years old, when she had an attack of interstitial inflammation of the cornea, and a second attack five years subsequently. She has the peculiar look and curious articulation which I have noticed in some of these patients.

The method I adopt to note the degrees of hearing is as follows :—

H.D. W. not heard.	If the watch be not heard when pressed against the ear.
Contact.	When it is heard only when it touches the ear.
1-50.	Heard at one inch.
2-50.	Heard at two inches, and so on to
50-50.	Normal. H.D.

If the watch is found to fail, the nail furnishes a good test in bad cases, the distance at which the click of the nail is heard being noted. Or the tuning fork may be tried with the normal ear and the affected one, and the length of time the perception of the sound is retained marked. So also the patient may be tried by engaging him in conversation at different distances, and with his face turned away from the examiner. The fact of his hearing better in a railway carriage, or worse at a dinner table, when many persons are speaking, and not being able to join in a conversation, should be recorded. This latter peculiarity points particularly, in my experience, to affections of the middle ear and ankylosis of the bones. In some instances the tuning fork will be heard only when placed against the teeth. I can only call to mind one case in which the sound was not so conveyed.

PAPERS ON THERAPEUTICS.

By W. Handsel Griffiths, Ph.D., L.R.C.P.E.,
Corresponding Member of the Therapeutical Society of Paris, and of the Pharmaceutical Society of St. Petersburgh.

ACIDUM NITRO-HYDROCHLORICUM.

In the concentrated form as "aqua regia" nitro-hydrochloric acid is not officinal, but is sometimes employed as a caustic, and Macnamara recommends it as being one of the most valuable and efficient remedies of the class, especially in the treatment of sloughing ulcers of the tonsils, in cancrum oris, and in the ulcerated sore-throat of scarlatina. The diluted acid is extensively used in the form of lotion or bath in cases of obstruction of the liver and chronic affections of the spleen. As a topical application the best method of procedure is to ring out spongiopiline in a lotion of it, consisting of six or eight ounces of the acid to the gallon of water: the piline should be laid over the affected region and covered with oil-silk. It may be permitted to remain on for an hour, and the application should be repeated three or four times daily. The dilute acid is used in this country in the form of a foot-bath, but in India the whole body is immersed, except the head. When the foot-bath is used the feet should be kept in it for 15 or 20 minutes, and should then be well rubbed with flannels.

According to Sir R. Martin the body-bath should be used as follows: Three ounces of hydrochloric acid and two ounces of nitric acid should be mixed with five ounces of water. Six ounces of this may be added to two gallons of water for a bath: the bath should be taken twice daily for about ten or fifteen minutes, and the temperature, according to Dr. Lendrick, should be between 90° and 95° F. It is hardly necessary to say that a wooden vessel should be used.

There can be no question that nitro-hydrochloric acid more than any other mineral acid influences the liver and other glandular organs of the alimentary canal. In chronic hepatitis it was recommended by Scott, Annesley, Sir P. Martin, and others, and is a powerful agent for good. Its use is absolutely contra-indicated in cases attended by high fever, or where there is a tendency to rapid suppuration. In jaundice and dropsies arising from derangement of the liver or spleen its employment both externally and internally has been attended with beneficial results. In the jaundice of torpidity, or in catarrhal jaundice, nitro-muriatic acid is a favourite remedy, but it is the experience of most physicians that it is useless, if not pernicious, in jaundice resulting from obstruction, or that due to organic disease. In the early stages of cirrhosis it is stated that apparent benefit has been derived from the use of this acid. In biliousness due to torpidity of the small glands of the mucous membrane of the alimentary canal it has been found of service. In intestinal dyspepsia characterised by chronic diarrhœa it is often useful, and in such cases it acts not as an astringent but by restoring the normal digestive power.

Nitro-muriatic acid has been recommended by Scott as a remedy in syphilis, but it has not proved advantageous in the hands of the majority of practitioners, and its employment will probably soon be limited to those cases in which mercury is contra-indicated.

In certain skin diseases, as in acne, in favus, according to Prof. Wilson, and in some of the exanthemata, lotions of nitro-hydrochloric acid have been successfully tried. In scrofulous cachexia it has been found useful. The acid has been used in chronic rheumatism. As a gargle in scarlatina it has been highly praised. Macnamara advocates its internal administration in this disease, and his formula is as follows :—

℞ Acid. nitric. dil., ℥j.;
Acid. hydrochlor. dil., ℥ij.;
Syr. rosæ, ℥ss.;
Infus. rosæ, ad ℥viii.;
Dose, ℥ss—i.

So ordered, he states that we get it fresh, and no doubt for internal use the freshly prepared acid is preferable. The acid has been used rather extensively in India in the treatment of cholera in doses of three drops, combined with ten drops of tincture of opium every one or two hours. Sponging the chest with it has been recommended in bronchitis. Hunt advocates its use in epilepsy. It has been used in the treatment of phosphatic, oxalic acid, and cystic oxide diathesis. In the second of these Prout urged that its administration should be continued until lithic acid or lithate of ammonia begins to appear, or for two or three weeks. Animal diet should be given, and starch and sugar avoided. The long continued use of nitro-hydrochloric acid occasions thirst, soreness of the gums, and salivation. In poisonous doses, the acid under consideration, gives rise to symptoms and results similar to those produced by nitric acid. The appropriate antidotes are the same as those for other mineral acids.

Clinical Records.

MERCER'S HOSPITAL.

Large Naso-Pharyngeal Polypus necessitating excision of a considerable portion of Right Upper Jaw—Amputation of Thigh in Upper Fourth—Ditto of Leg below Knee, with subsequent Disarticulation of Head of Fibula—Dislocation of Patella from accident reduced by operation four years afterwards—Strangulated Inguinal Hernia (2 cases) —Cancer Lip—Severe Injury to Head and Face, complicated with Fracture—Ditto of Forearm, followed by extensive Gangrene of Skin—Compound Fracture, with Dislocation of Elbow.

During the month of January several important surgical cases—operative and traumatic—were under Mr. O'Grady's care for treatment in the surgical wards of this institution. Amongst others were those quoted.

On the 18th inst., a lad past fourteen years of age was operated on for naso-pharyngeal polypus, which not only occupied these spaces, but also extensively involved the

right inferior maxilla, expanding and perforating that bone, a portion of the growth showing exposed beneath the cheek. The anterior and alveolar portions of the jaw-bone itself were also much diseased, sinuses leading through the cheek in different spots to the damaged bone; ectropion being present too. The extent of disease enforced the extensive removal of bone—the floor of the orbit—with the malar articulation, however, being preserved intact. The incisions ran beneath the orbit along the side of the nose into the nostril, and through the upper lip. To the attachment at the occipito-sphenoid bone, after the surface had been well scraped, the actual cautery was freely applied. The case progressed most favourably; in a week the line of union was so little noticeable that the patient, who was a very intelligent lad, could not trace it when scanning himself in a looking-glass; there is no deformity, and the deeper part of the chasm continues to fill in nicely.

The thigh amputation was on the 9th, for wide-spread suppuration of the soft tissues and disease of bone consequent on un-united fracture of femur, which had been operated on several weeks previously. The exigencies of the case required the section of the bones to be nearly subtrochanteric. The prolonged drain had reduced the patient, a young man, to a very enfeebled condition, signs of incipient chest damage being present too. Since the operation progress has been far more favourable than was expected, the stump advancing steadily towards repair, the patient improving daily in health, and being now able to sit up and commence the use of crutches.

In the accident ward is another case of amputation of the leg, which to all appearance had progressed excellently after the operation, the stump being in three weeks nearly healed, and the patient already able to get up daily and begin to move about on crutches. Profuse hæmorrhage suddenly occurred, and proving uncontrollable by other means, necessitated the stump being laid open freely, when the bleeding vessel was seen to be one of large size, situated deep between the two bones so placed that it could not be got at to secure it, though distinctly seen spouting. The head of the fibula was necrosed, the sawn extremity being extremely sharp, and was evidently the cause of the mischief to the vessel. The diseased head of the fibula having been disarticulated, the bleeding artery was then ligatured without further difficulty. The man was much prostrated from the previous loss of blood, and convalescence was slow; he gradually, however, gained ground, and eventually made a good recovery, having commenced to use a pin leg, and being about to leave the hospital.

In the same ward is another case possessed of some points of considerable interest. A boy, aged thirteen years, dislocated his patella outwards whilst leaping off a hedge four years ago. Articular disease supervened of a chronic type, gradually becoming extensive, and rendering the condition of the joint an unpromising one. Hoping there might be a better prospect for conservative treatment if the displaced bone was restored, this was attempted, and successfully effected after free section (by a fine tenotome) of extensive inter-osseous fibrous adhesions. Much difficulty was experienced in dressing the case, from the tendency of the patella to slip back to its acquired bed. The limb was at first kept at absolute rest on a "McIntyre;" subsequently a sloped-back splint being provided, so as to allow exercise to be taken, the joint being the while kept immovable. So far progress has been favourable, but from the amount of disease prognosis must still be considered doubtful.

Two patients, the subjects of strangulated hernia, were also under observation. One, a man, aged 57 years, was operated on at the end of November, but had to be retained in the wards after complete recovery from this for urinary trouble. The rupture was inguinal, of considerable size, and three days strangulated. The sac had to be opened; it contained about seven inches of gut, the greater portion of which was extremely dark and unpromising-looking. Nevertheless, recovery proceeded with rapidity, the patient being able to go about with a truss in a month, and with every fair likelihood of a radical cure. The issue in the second case was not so fortunate. The hernia in this was also inguinal, four days strangulated. The patient, a thin, spare woman of 50 years, but looking older, was in a very prostrate condition on admission. Stercoraceous vomiting had occurred early. The sac, which was of unusual thickness, had to be opened. After the operation complete relief was afforded to the sickness of the stomach. Nourishment and stimulants were freely taken, and with relish; large quantities of flatus were passed by the anus, a full and healthy fæcal evacuation also taking place on the second day. The weakness, however, continued progressive; the patient steadily sank and died, just three days after the operation.

Amongst the minor operation cases under observation during the month were three of cancer of the lower lip. Two of them were of limited extent, and removed by the ordinary V incision. In the third case, which was further complicated by severe chronic bronchitis, were two separate and distinct small-sized growths, so far apart as to require independent removal at the same sitting.

An important case of head injury presented in the person of a publican, who fell off a car, and was, it is presumed, severely kicked whilst on the ground by the horse. The left side of the face was split up and down at the commissure of the lips, requiring numerous sutures (carbolised catgut) for readjustment. Over the eyes at the same side was another jagged wound, where the finger made evident that a portion of the supra-orbital margin had been knocked off. *The detached bit of bone was nowhere to be found.* Marked palpebral and subconjunctival ecchymosis were present. There was mental abberation for some hours, and subsequent head symptoms, and in less than a month the patient left the hospital, his stay there so long being caused by extensive suppuration of the right hand, consequent on local injury, also received at the time of the accident.

On the same day the foregoing case was admitted there was also a woman, 50 years of age, taken in, who had fallen down a flight of stairs and received a severe lacerated wound of the right forearm, about its centre; this ran obliquely round the limb, nearly completely surrounding it. The wound at first presented nothing remarkable in its appearance, but the integument (which was not to any notable extent "undermined") along its lower border sloughed to nearly a hand's breadth, as did also the subcutaneous areolar tisssue very extensively. After a detention of three weeks in hospital the woman was able to leave, the wound being then a large healthy ulcer, healing nicely.

In the same ward another complicated injury of upper extremity was also for a short time under treatment in the person of a woman aged 54. She was reticent as to the cause of her hurt, which was evidently due, however, to a severe blow, such as possibly might be inflicted by the squared extremity of a poker. The radius was dislocated forwards, and the ulna broken about an inch from the tip of the olecranon, the skin at seat of fracture being perforated and discharging synovia in small quantity. The dislocation was easily reduced, but the action of the triceps rendered it difficult to secure the fracture in accurate apposition. The wound was sealed by compresses of lint soaked in "Friar's balsam," and after the fingers and limb had been carefully bandaged, a suitable gutter splint was applied. No bad symptoms supervened. In six days the patient took her discharge, and, it is to be regretted, has not since been heard of.

THE mortality from the seven principal zymotic diseases exclusive of small-pox is still considerably below the average of the last ten years throughout the United Kingdom.

PROFESSOR PIROGOFF has been appointed by the Russian Government to take the direction of the field ambulances in the event of active operations supervening.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

FRIDAY, JANUARY 26TH, 1877.

GEORGE W. CALLENDER, F.R.S., President in the Chair.

PRESIDENT'S ADDRESS.

Mr. CALLENDER (the President) delivered the annual address.

CASES OF SUBCUTANEOUS SECTION OF THE NECK OF THE THIGH-BONE.

Mr. B. E. BRODHURST contributed a paper in which two cases were fully reported, and seven others, also operated upon by himself, were referred to. In each of the two cases the right thigh was flexed upon the pelvis, and the knee was crossed over the opposite thigh in such a manner as to close the vagina and to interfere with the evacuation of the bladder. As a consequence of this position excoriation of the thighs, with considerable discomfort, constantly occurred; whilst the shortening of the limb, in one instance to the extent of seven inches, and in the other to the extent of four inches, rendered it necessary that artificial support, such as sticks or a crutch, should be used in walking. In the first case the patient's age was eighteen when she first came under Mr. Brodhurst's care in 1864. As the result of an accident at eight years of age, hip-joint disease had been established, followed by suppuration, and eventually by bony ankylosis, with the thigh flexed and adducted. Mr. Brodhurst divided the neck of the femur subcutaneously. The external wound was an inch and a-quarter in length, and the knife was then passed down to and over the neck of the femur; it was then withdrawn, a small strong saw was introduced, and the bone divided immediately above the trochanter. The saw was then reapplied, and a small portion of the bone removed. The wound healed by first intention. The limb was placed semiflexed on an interrupted splint. In six weeks the patient walked with help, and bore some weight on the foot. Fair motion of the limb in all directions resulted, and still remained, twelve years after the operation. In the second case the girl was aged 16, and had bony ankylosis at the hip-joint, with great flexion and inversion of the thigh. Inflammation had commenced nine years previously, and was followed by abscess. Mr. Brodhurst, in this case, made the external wound only just large enough to admit the small saw with which the neck of the femur was divided. The bone was exceedingly solidified and thickened, felt like ivory, and twenty minutes were occupied in completing the section. There was some hæmorrhage. After section the limb could be fully extended, but extension was painful, and consequently, for several days the thigh was kept slightly flexed. Suppuration took place, and an abscess formed at the junction of the upper with the middle third of the thigh. The splint was removed, and extension was then made by means of weights. In about three months the patient could walk and bear her weight on the limb. Mr. Brodhurst had done eight similar operations, some with the smallest possible opening, others with an opening about an inch in length, and he "had always found that where the opening was small, and there was, in consequence, stretching and bruising of the adjacent soft structures, suppuration followed; but that, where more room was allowed for the necessary movements in dividing the bone, healing took place very rapidly." A large opening was therefore desirable to prevent injury to the soft structures, but it need not be placed so as to correspond, when the operation was complete, with the section of the bone. "The subcutaneous character of the operation did not depend so much on the size as on the position of the wound." In some cases which had been recorded, after operation, the deformity had remained. The wound should then have been enlarged, and either a wedge-shaped or circular piece of bone removed, or the operation of Mr. Gant, of division below the trochanter, should have been chosen. Where the bone was very hard, it should be divided with the saw; the chisel of Volkmann, as used by Mr. Maunder, should be reserved for cases where the bone was tolerably soft. Where the ankylosis was fibrous the bone was soft and divisible with the chisel; but it was undesirable to resort to a cutting operation when deformity might be removed without the use of a knife.

ANKYLOSIS OF HIP-JOINT: SUBCUTANEOUS SECTION OF SHAFT OF FEMUR.

Mr. CROFT exhibited a patient whose case, he said, bore upon the question of the respective merits of dividing the femur above or below the trochanter. The man was a clerk, aged 22. In June 1875, he first felt pain at the hip. Until then, he had felt quite well, except that three months previously he had contracted gonorrhœa. The discharge ceased soon after the pain at the hip began, and never reappeared. Two months before the pain commenced, he fell from a height of about five feet on to his hip. There was swelling about the hip and thigh at the end of June: and in the groin at the end of July. In August, there was great pain on moving the hip, and no starting pain at night; the end of that month there was a large abscess. In October, the abscess was punctured, and a large quantity of greenish pus was let out. The discharge lasted until February 1876; it then ceased and a sound scar formed. In March, he walked about with the help of a chair. On May 29th, he was admitted into St. Thomas's Hospital; he had never had rigors nor cough. On admission, he was thin and perspired easily; his appetite and secretions were natural. The thigh was rotated outwards, so that the neck of the thigh-bone touched the rim of the acetabulum. On June 23rd, the angle formed by the thigh and the middle line of the trunk was one of 140 degrees. On July 3rd, the patient was examined under chloroform by Mr. Croft and Mr. MacCormac. No motion could be produced, and it was concluded there was bony ankylosis. On July 12th, the shaft of the femur was divided below the trochanter by Mr. Croft, in the presence, amongst others, of Messrs. Adams and Gant. This operation was chosen because, had section of the neck of the femur been adopted, the incision must have been made through old scar-tissue, whilst there were also adhesions in front of the bone which would have formed obstacles to the use of the saw at that spot. Further, Mr. Croft did not wish to obtain any movement of the limb. The operation was an antiseptic one; the opening in the skin was as small as possible, and the wound was dressed antiseptically. A good deal of suppuration at first occurred at the site of the operation, but a free drainage was established, and the patient then continued to improve. Now there was firm bony union at the line of section. The case was interesting from the nature of the operation. It was unique in being an operation done with the saw below the trochanters in an adult. Probably, if the wound had been closed hermetically directly after the operation, there would have been no suppuration. The saw and knife which were used were both dipped in carbolic solution before the operation, the spray was used during, and antiseptic gauze applied after, the operation.

Mr. BARWELL regarded the employment of antiseptics as of great importance, and cited two cases in neither of which did suppuration or pain exist. With respect, however, to the choice of instruments, he thought that the dust left from the use of the saw was liable to irritate the wound and set up suppuration. As the operation was one of convenience merely, the percentage of deaths was too high to warrant its adoption. But with the use of the chisel and the antiseptic method the risk was reduced to a minimum, and with antiseptics the subcutaneous method was not so imperative. Mr. Barwell then referred to the various modes of operation that had been adopted, and said, that whatever might be the ultimate result of any operation its value must depend upon the presence or absence of suppuration.

Mr. GANT thought that the views taken by members were too mechanical, the most important point being the conditions that were most favourable to the operation. Adams's operation was not adapted to two conditions of disease—viz., where there was scrofulous disease of the joint, in which case the neck of the thigh-bone was gone, or was not sufficiently vascular to unite; and, in the second place, where the neck was much enlarged by deposit due to chronic rheumatic affection. These facts induced him in 1871 to recommend division of the neck just below the trochanter, and two cases were referred to in which this measure was followed by success. As to the operation, neither Barton's nor Sayre's could be called subcutaneous. The saw could not be set aside for the chisel. His operations had been recently successfully performed by Prof. Pancoast, and Mr. Maunder agreed with Mr. Gant in not regarding Mr. Brodhurst's case a subcutaneous one. He thought the rivalry between the chisel and saw a wholesome one. In his opinion, the saw was preferable for section of the neck of the thigh-bone when it was desirable to establish a false joint by simple linear section of the bone,

and on account of the possibility of suppuration he thought this would ultimately be the only case in which the saw would be used. Mr. Croft's case did not appear a favourable one for the use of the saw; and in only one out of his own eight cases did he use that instrument, and the patient, though done in June, was not well yet. In nine cases where the chisel was used suppuration had only occurred in two.

Mr. FURNEAUX JORDAN stated that he was the first to perform subcutaneous division of the neck of the femur by Adams's method. This was in a young woman with strumous disease of old date, with great flexion and adduction of the affected limb. A punctured wound was made and the neck of the bone was divided with a strong saw. The operation was not strictly subcutaneous, and no antiseptic precautions were used, but, nevertheless, the case did well.

Mr. BRYANT also thought that Mr. Brodhurst's cases could not be called subcutaneous. He had a good opinion of the subcutaneous operation, and four cases in which he had performed it with a saw were successful. No antiseptics were used, a small valvular incision was made, the operation occupied only two or three minutes, no suppuration occurred, and the recovery was rapid. Mr. Bryant then said, that when the neck exist Adams's operation was better than division below the trochanter, but if it were present, Gant's or Barton's. With regard to the instrument, he thought that the choice of chisel and saw seemed to depend upon the fancy or whim of the operator.

Mr. BRODHURST said, that none of the operations could be strictly subcutaneous, and that it did not matter whether the incision was one or one and a quarter inches in length. He had also operated with a small wound, merely a puncture three times. He had operated on nine cases in all, in three with a small incision, in the others with one of about one inch. A full incision gave greater freedom of movement and prevented any suppuration arising srom bruising of the parts.

Mr. CALLENDER suggested that the operation should be called "valvular," as "subcutaneous" was certainly an incorrect definition.

SURGICAL SOCIETY OF IRELAND.

THE Fourth Meeting of the Session was held on Jan. 19th, the Vice-President of the College, Dr. ROBERT MCDONNELL, in the Chair.

Dr. SWAN read a paper on

THE DUBLIN ORTHOPÆDIC HOSPITAL, ETC.,

which will be found on page 121.

Mr. TYRRELL said that they must congratulate themselves that a new Institution had been opened, one of two for the treatment of those deformities, which Mr. Swan said were not treated so effectually, or at least that the public did not think they were so effectually treated in the general hospitals of Dublin. He (Mr. Tyrrell) could only speak for the Institution (the Mater Misericordiæ Hospital) with which he was connected. He was bound to say that at that hospital they were not deficient of careful nursing, nor had they found in any case that the youngest of the patients were frightened by the presence of others in the wards, or that their parents had not entire confidence in the Institution and in those who had the management of it. As the best proof of that they had several cases under their care now—and in fact always had, at any rate, since he had been connected with the hospital—of various deformities; in fact, their space was too limited for the numbers that applied, although it was considerable. They gave, too, any length of time—six months, nine months, twelve months, as the case may be, so that as regarded the expenditure of time on these cases they were also not deficient, and that they might not be quite efficient to treat those cases it was not for him to say; at the same time he was bound to observe that he did not think orthopædic surgery presented those innumerable difficulties that it should be raised into a specialty in Dublin, and that ordinary surgeons were, to let deformity by deformity escape from them under their eyes, until at length they would positively have nothing but toe-nails to clip. So much for the general policy, at the same time not wishing in the slightest degree to put any stoppage on the superabundant charity of the opulent. Still, he did say, so far as he was concerned, that orthopædic cases were never refused, nor were any of the varieties of disease to which the human frame was liable ever driven from the doors of the Mater Misericordiæ Hospital. With respect to the special instruments, he did not think they called for much comment. He must say, however, that in the ordinary talipes, of which he had treated some few cases, particularly in the minor varieties, that he thought Mr. Barwell's method—although Mr. Swan said he was not now regarded as an authority—was most effective. With regard to the diseases of the spine, he (Mr. Tyrrell) presumed that there was no hospital in Dublin which did not treat them, particularly the forms of Pott's curvature, which was—by rest; and he hoped there was no Institution that would send away a child or an adult if they had it in their power to make them sound and well. He did not of course wish to detract from the merits of the Institution with which Mr. Swan was associated, but at the same time, it would not be fair to the Institution with which he (Mr. Tyrrell) was connected if he did not state that that hospital was in every way prepared to treat these cases—they had all the appliances, expense was no object, the expenditure of time and nursing was no object.

Mr. ORMSBY wished to mention that he published a few weeks ago an account of the practice which was pursued in his Institution. Some of the splints exhibited by Mr. Swan he (Mr. Ormsby) had been in the habit of using for the last four or five years, and if Mr. Swan had looked at his (Mr. Ormsby's) little book he might have seen nearly all the remarks which he had given to the members of the Society that evening. He had also failed to allude to Dr. Little, the father of orthopædic surgery in London. For his (Mr. Ormsby's) part, he never for one single moment thought that orthopædic cases should not be treated in a general hospital, as he did not think there was great difficulty in treating such cases in a general hospital; but as there were hospitals for eyes, ears, throats, and so on, he thought it was well that they should have hospitals for the special treatment of orthopædic cases, especially when there were three of the kind in London. He was in Bartholomew's and University College Hospitals recently, and he did not see a single orthopædic case. The surgeons there did not want the trouble of them. These cases were extremely troublesome, and hospital surgeons could not give up the time that was requisite to them. It was very difficult and irksome to be changing splints, and if they were not changed every day it would lead to results that would render it necessary to take them off altogether, and thus the labour often of months would be destroyed.

Dr. THOMSON said, that he did not know that the members of the Society would be altogether satisfied with the exposition of orthopædic surgery that they had had that night; firstly, from the reader of the paper; and secondly, from the surgeon of the second or rival Institution. Mr. Swan had given them some reasons for the establishment of the new orthopædic Institution, and Mr. Ormsby had attempted to defend the principle by stating there were hospitals for the examination of the throat and other portions of the human body, and taking that ground he (Mr. Thomson) thought that he might have said that they should have Institutions for the treatment of affections of the nose, and for the paring of toe-nails, as Mr. Tyrrell had suggested. He (Mr. Thomson) would not have thought for a moment of entering upon the question of general or special hospitals, but that it had been introduced by the reader of the paper, and, from his (Mr. Thomson's) own point of view, he thought that this question of specialism had got into rather an exaggerated growth. He thought the intention of all hospital teaching was this: that they were to instruct the students to the fullest extent in their power, as they were hereafter to be practitioners in the country or in cities. They all knew that every student could not be an hospital surgeon, and that, in the great majority of cases, they were isolated in country districts where they would have to get independent. They knew also that the present tendency of medical education was to multiply the number of lectures, and the teaching in general; and if they were to compel students to attend these special hospitals, as well as to attend the lectures at the general hospitals, he did not know in what way they were to enable them to get through their work in the space of twenty-four hours. He held that a general hospital was a fair place for the student for learning this practice of orthopædic surgery. The dispensary doctor who was in the country would, from time to time, have those cases brought before his notice. The parents of those children who had suffered from these deformities might not be able to send them up to the city from inability to undergo the expense attendant upon such a course, and the dispensary doctor

might, if he had seen such cases treated in the general hospital which he had attended in the city be able to afford that relief which the child should receive. Now, the whole principle, he maintained, of this specialism was to cut off the student from knowing anything whatever of the treatment of such ordinary cases as this; and therefore he held that they ought not for a moment to countenance what he would call an exaggeration of this principle of specialism. Leaving that branch of the question, he would now go simply to the question of treatment. He came there that night certainly expecting to hear something of the treatment of these cases that had been presented at both of the hospitals superintended by Mr. Swan and Mr. Ormsby, and he did not know that he (Mr. Thomson) had been enlightened, or that any other member of the Society had. All he could say was this: As at Mater Misericordiæ Hospital, so at the Richmond, they were always very glad to admit every case of orthopædic surgery that presented itself. There was not one of his colleagues who had not from time to time in his own presence (as he had also himself) operated on many of these cases of talipes that had been referred to, nor had any rejection of cases ever been attempted. They had obeyed the usual principles, and treated those cases upon the ordinary and upon the true principles of treatment, and they had had results, he thought, quite as satisfactory as probably were attained in these special hospitals. The point Mr. Swan had mentioned—some modifications of a Scarpa's splint, which he had exhibited that evening. His (Mr. Thomson's) experience of the treatment of talipes was that the splint devised by Mr. Tufnell, the "L" shaped tin splint, was an extremely satisfactory instrument, and it did for the surgeon all that he really required in these cases. Mr. Ormsby had spoken of the difficulty the surgeon experienced in attending to these cases in a general hospital, and assigned as a reason that the splints must be changed every day or adjusted in order to avoid any scoring of the integuments. His (Mr. Thomson's) experience of Mr. Tufnell's splint was that it was an instrument that might be allowed to remain on for several days, and if it was properly put on with a paraffin bandage, it might remain on as long as a week, and for even longer. It remained so perfectly fixed that it produced no inconvenience or any scoring of the limb. With regard to the difficulty surgeons had in attending to these cases at general hospitals, he thought in every hospital where there was a desire on the part of the surgeon to make their pupils practically acquainted with the surgery of the hospital, there ought never to be any difficulty in the treatment of cases of this kind, and especially where the resident surgeon happened to supervise the operations of the students in the absence of the surgeon himself. He (Mr. Thomson) knew in the hospital with which he was connected the students were always glad to get the dressing of these cases, and they were able to adapt the instrument to the limb, and to carry out the principles which were laid down for their guidance by the surgeons in whose charge those cases might happen to be.

Dr. E. H. BENNETT said he must also rise to defend a branch of the profession to which he belonged from the charge which was brought forward publickly against it in the advertisements of the two Institutions, which charge was—that the general hospitals were incompetent to a large extent to treat these deformities. That was a charge that the staffs of the general hospitals would not admit, and it was well known that they did not neglect to treat those cases, and they would not admit that charge in any degree.

Dr. CORLEY said as regarded the necessity for these special hospitals, he thought the multiplication of small hospitals was one of the greatest evils that a place like Dublin could be subjected to; but it would be a much greater evil if the profession was to be separated into distinct branches such as was contemplated in such hospitals as the one under discussion.

Mr. RAWDON MACNAMARA said he did not think they were called there to discuss that. They were called there to hear an account of the conduct of a certain Institution, and the practice therein pursued; and for his part he regretted that the author of the paper did not enter more largely into the latter portion of the subject. He was perfectly prepared to assert on behalf of the hospital to which he belonged, that they were capable of discharging their duty.

Mr. B. WILLS RICHARDSON wished to mention that since the Adelaide Hospital had been opened they had never refused any of these deformites. They invariably treated such cases, and he was very seldom without a case of the kind in hospital.

Dr. B. F. MCDOWELL.—I can say the same for Mercer's Hospital.

Dr. DARBY said that during the time he was a student he spent seven years between Richmond and Steevens's Hospitals, and he saw a great many orthopædic cases treated there, but he never saw a case of the kind neglected in either of those Institutions; neither did he ever see a case in which the surgeon had not time to treat them properly, and he (Dr. Darby) saw those cases treated with the greatest success.

Dr. THORNLEY STOKER believed that at the Richmond Hospital they were as competent to deal with such special cases as Dr. Swan had referred to, or any other Institution could be. They had means at their command inferior to none, and they could and were willing to keep cases any length of time that was necessary.

Mr. F. T. PORTER said it appeared to him that they could not utilise these special Institutions, as they were at present constituted. Students would not attend them for the reason that they were not obliged to attend them, and for that reason he thought it would be much better to have both orthopædic and ophthalmic wards in general hospitals, and to have specialists in charge of these wards, because the students must attend the general recognised hospitals. He thought for educational purposes it would be much better to have those special subjects taught in that way.

The VICE-PRESIDENT said that before the discussion closed, he desired to make one or two observations. It was quite obvious, too, that a paper of the kind read by Dr. Swan, was likely to give rise to a slight conflict of opinion between the advocates of special hospitals, and those who are the advocates of the large general hospitals to which they were attached. The paper so completely opened up the question that he thought it came legitimately before the meeting, and he did not wish to curb the discussion. The case had been put well on both sides, and there was, too, a great deal to be said on both sides. These special hospitals had been to a certain extent established, and of course there were limits to which they should be restricted. They did not object at all to midwifery hospitals, and hospitals for the special treatment of syphilis are in existence; and now they had their orthopædic hospitals coming more and more into play, and how far it was desirable to curb the specialism was a most legitimate subject for discussion in a Society like this.

Dr. SWAN, in reply, said he certainly must admit that there were a great many deficiencies in his paper, particularly with regard to the practice adopted in the orthopædic Institution to which he belonged. However, he admitted in the paper that it was only a brief outline of what they intended to do. He must altogether disclaim having made any statement which any person could convert into an expression of his opinion of the incompetency of any general hospital, or hospital surgeon in Dublin, to treat orthopædic cases. With regard to his having placed an orthopædic Institution in opposition, as regarded the material benefit they derived, to any general hospital—he never intended to do any such thing. He intended to act for himself, independently. Of course, however, he invited criticism as regarded the necessity for the establishment of such hospitals, and it had drawn a very marked expression of opinion from many gentlemen present.

NUMBERS OF HEMP SEED CALCULI PASSED PER URETHRAM.

Mr. B. WILLS RICHARDSON said that a few years ago he had a gentleman very advanced in life under his observation, who in the space of a few months passed upwards of 200 small hemp-seed calculi, and eventually died of renal disease, hæmaturia having been an almost constant symptom.

Under one of the microscopes on the table there was a section of one of these calculi made for him by Mr. Charles Baker, of Holborn, London. The calculus was so small, he did not venture to cut it himself, and under the other microscope there was a complete transparent section of a mulberry calculus an inch in diameter, which he himself prepared.

Both calculi, it would be seen, were identical in structure, and it was scarcely necessary to say were composed of oxalate of lime.

The specimens were mounted in Canada balsam.

The Society, after viewing the sections under the microscopes, adjourned.

THE medical officers and officials of the Glasgow Western Infirmary have presented Dr. Lilly, the Superintendent, with a handsome gift consisting of a silver salver and tea and coffee service as a token of their esteem on the occasion of his relinquishing the appointment.

Parliamentary Intelligence.

INTEMPERANCE.

In the House of Lords, on Friday,

The Archbishop of CANTERBURY rose to move "That a select committee be appointed for the purpose of inquiring into the prevalence of habits of intemperance, and into the manner in which those habits have been affected by recent legislation and other causes." This was merely a motion for the re-appointment of the committee which began its labours within a few days of the end of last session, and was unable to bring its proceedings to a successful issue.

The motion was agreed to without comment, and the House immediately adjourned.

THE SMALL-POX EPIDEMIC.

Sir TREVOR LAWRENCE asked the President of the Local Government Board whether, having regard to the severity of the present epidemic of small-pox, the urgent necessity of providing facilities for vaccination in its most efficient form, and the prejudices which, however unreasonable, exist in some parts against vaccination from arm to arm, he will take steps to provide a supply of vaccine lymph from the calf for such public vaccinators as may require it, as is done in Belgium.

Mr. SCLATER-BOOTH said this subject had received the attention of the Government. In times past the practice which prevailed in Belgium and other countries was inquired into, and an account of the inquiries were contained in the twelfth annual report of the medical officer of the Privy Council. The result of his inquiry at that time was not favourable to the experiment, and a subsequent investigation was of a conflicting character. The subject was, however, now under consideration, and would not be forgotten by the Government.

THE ROYAL COLLEGE OF PHYSICIANS.

AT a meeting of the College held on Thursday week, a communication was received from the General Medical Council, asking the College under what conditions it would be disposed to admit foreign graduates to examination. The President said that the matter had been brought before the Censors' Board; but, as the present regulations afforded comparatively easy and convenient facilities to foreign graduates, the Board did not think it advisable to make any alterations.

The propriety of demanding from candidates additional knowledge on the subject of psychological medicine was also taken into consideration. But the Council did not think it advisable to take such a step, considering that students had already permission to substitute a three months' attendance at an asylum in lieu of a like period of attendance on ordinary hospital practice, and as, moreover, they had the opportunity of attending lectures on mental diseases at the medical schools.

A report by the Leprosy Committee on the therapeutic value of the "cashew" and "gurjun" oil treatment of leprosy was adopted by the College, and was ordered to be forwarded to Lord Carnarvon and the India Office for their information. The report stated that the conclusions drawn on the subject by Dr. Gavin Milroy, from his personal investigation in the West Indies, were that the cashew oil diminishes or disperses for a time the local tubercular formations, but that the coincident general improvement is chiefly due to the hygienic measures and liberal diet prescribed at the same time, and that there is no proof that the oil can effect a decided cure. The gurjun oil is also considered a remedy of considerable efficacy in modifying local conditions and in improving the general condition of the leper. On account, however, of the good effect of improved hygienic conditions, the College would strongly urge the Government to direct its attention to this important consideration. The College decidedly recommends that lepers should be placed under the immediate charge of the Government in hospitals or asylums provided for the purpose, and where not only all necessary hygienic conditions would be attended to, but where the real value of any system of treatment could be thoroughly investigated by competent medical men.

It was also decided that the work of preparing a new edition of the "Nomenclature of Diseases" should be forthwith commenced, and that a committee should be appointed by the College for the purpose of carrying out this decision.

It was also resolved that a new Roll should be published.

Drs. Habershon, Barnes, Bucknill, and H. Weber were elected members of Council.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
,, IF PAID IN ADVANCE 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.C.
A. H. JACOB, 23 Ely Place, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, FEBRUARY 14, 1877.

THE DATE OF MEETING OF THE GENERAL MEDICAL COUNCIL.

A RUMOUR has reached our ears to the effect that the 10th of May is all but fixed for the assembly of the General Medical Council, and the report comes with so much probability of truth, that we feel justified in expressing a very strong opinion upon the matter. The selection of so late a period of the Parliamentary session for the deliberation of the Council is to all intents and purposes an abdication by it of any claim to control the medical legislation of the present session, and so far is a very humiliating confession of a want of influence with the Government, with Parliament, and with the public in those matters which the Council is supposed to rule. It will be recollected that last year Mr. Cowper-Temple's Foreign Diplomas Bill, Mr. Russell Gurney's Lady Doctor Act, and Mr. Gibson's County Infirmaries Surgical Qualification Act, were settled by Parliament while the Council slept, and had, to all intents, become law before their opinion was or could be expressed. This year we may anticipate renewed legislation upon th

recognition of foreign degrees, stimulated by t bill recently introduced into the French Chamber to exclude English diploma holders from French practice. We may not improbably have other important legislation deeply affecting the profession, and are these matters to be left to the arbitrament of Government and the House of Commons without a word of advice from the Medical Council? It seems to us that the medical interests of the country are from year to year deliberately sacrificed to the convenience of a few individual members of the Council, and it is time that it should be understood that our medical Parliament makes no claim to exercise any influence in these matters, and that its views may therefore be disregarded.

We trust that it may not yet be too late for the President to alter the date of meeting and to call the Council together for the second or third week in March, in which case the profession might hope for that careful elaboration of coming medical law which its importance deserves, and which it too seldom receives. The President is invested with the power of mustering the Council, and must therefore, be held responsible for the postponement of its sitting to a time when its deliberations can yield no good result, and we have confidence that a reconsideration of the circumstances will convince him that so late a date as the 10th of May would be a cardinal mistake, and one which ought to be speedily remedied.

PSYCHOLOGICAL MEDICINE.

At a recent meeting of the Royal College of Physicians of London, the College came to a decision respecting the propriety of requiring from their candidates some guarantee of their having obtained more knowledge of psychological medicine than that usually picked up at our medical schools. The question had been under discussion at a previous meeting of the College, and it was handed over to the Council to make a report on the subject. The decision arrived at by the Council, and approved of by the College, was (as we have already pointed out), that they did not think it advisable to make any special regulations on the subject. The reasons on which the Council based their recommendation were—that the College had already given students permission to substitute a three months' attendance at an asylum in lieu of a like period on ordinary hospital practice, and that students had also the opportunity of attending lectures on mental diseases at the medical schools.

We think that few will find fault with the decision which the College has arrived at upon this important question. Considering the large number of subjects which at present engross the attention of the student, the more extensive acquaintance with these subjects which he is now expected to show before our chief examining boards, and the comparatively short time he has for doing it all, it would be imposing too much upon his working powers were psychological medicine to be made a special subject of study or of examination. Already the curriculum of studies pursued at our medical schools embraces so many subjects that—in respect of some of them—more than a mere smattering is rarely attainable; and, unfortunately, as the experience of our public examiners so frequently teaches, the acquisition of a thorough knowledge of the more important and practical branches of medicine is sacrificed to a superficial acquaintance with subjects of comparatively little importance. We shall hear a candidate talk glibly about the chemistry of the alcohols or the characters of a calycifloral plant, while he cannot diagnose an emphysematous lung, pass the catheter, or use the short midwifery forceps.

Ready, however, as we are to endorse the decision of the College and to deprecate the devotion of the student's time to too many subjects, or to such as may be styled mere professional accomplishments, we certainly think that psychological medicine is a subject to which neither teacher nor pupil has hitherto paid much attention. It is a very significant fact that most of our text-books on practical medicine ignore the subject altogether In one of our most recent—and, otherwise, one of our best—medical treatises not a page is devoted to mental diseases. Nor does this class of maladies receive any more attention at the hands of our lecturers on medicine. Like diseases of the skin, they are either dismissed with a very brief notice, or they are wholly disregarded. The consequence of this is that the graduate in medicine enters upon practice with little or no knowledge of this important subject. When he is called to a case of mental aberration, he is completely in a fog. A medical expert is, if at hand, at once called in, or the poor patient is hurried off to an asylum.

We are at a loss to understand why the diagnosis and management of the more common forms of mental derangement should not be as familiar to the general practitioner as the diagnosis and management of any other class of diseases. To be able to recognise and treat a case of incipient mania is surely of as much consequence as to recognise and treat a case of pneumonia or pleurisy. The general practitioner has often the great advantage of seeing these cases from their commencement, and at a time when they are more amenable to treatment than they are after some period has elapsed. Everyone knows how troublesome these cases are, especially when the ordinary medical attendant of the family has at once to leave their treatment in the hands of strangers. The incipient or actual lunatic is suspicious of the attention which certain visitors appear to pay him. He resents their interference, and his symptoms are perhaps aggravated by their presence. On the other hand, much might be done by the persuasion and skilful management of his own medical attendant, which could not so well be accomplished at a later period, or by persons to whom he is a perfect stranger. In saying this, we are fully aware of the many instances in which the early removal of the patient to an asylum offers the best chance for his recovery; but, even in these cases, several days must often elapse before he can be removed, and during which as respects his treatment, much valuable time may be lost.

We, therefore, hope that the decision which the College of Physicians has arrived at with regard to the study of psychological medicine will not prevent this subject taking a more important place than it has hitherto done in the ordinary course of studies pursued at our medical schools, and that when our pupils are launched into practice, they may feel as competent to handle a case of mental derangement as to treat an inflammation or fever.

THE PRESS AND THE LAW OF LIBEL.

At the Court of Appeal, sitting at Westminster, a case was recently decided, which is of unusual interest, and which should particularly command the attention of journalists.

The original action was brought by Dr. Purcell, medical officer to the Board of Guardians of Altrincham, Chester, against the proprietor of a Manchester newspaper. It appears that some of the members of this board had made some severe strictures upon the conduct of Dr. Purcell, charging him with neglect of his duties, inhumanity, and other offences. Dr. Purcell could not legally proceed either against the Board of Guardians, or the individual members who had aspersed his character, but as a full report of the proceedings at the board, including the charges that had been brought against him, was published in the *Manchester Courier*, he brought an action against the proprietor of that paper for libel. The first trial of the case, however, resulted in a compromise being agreed to, subject to the point of law as to whether the report was privileged, and whether the proceedings of the Board of Guardians were of sufficient public interest to justify a full and complete report of them. This question was argued before the Court of Common Pleas, in the hearing of Messrs. Justices Brett, Archibald, and Lindley, and the case was decided in favour of the plaintiff, on the ground that the proceedings of the board are not a matter of public interest, and that therefore a newspaper was not warranted in publishing a report of them. Against this decision the proprietor of the *Manchester Courier* appealed, the result of which, however, though still in favour of the plaintiff, showed how lawyers, like doctors, sometimes disagree. The Court of Appeal, in direct opposition to the decision previously arrived at by the Court of Common Pleas, ruled that the proceedings of the Board of Guardians was a matter of public interest, but that a newspaper is not on that account justified in publishing an account of them. The original verdict, therefore, has been confirmed, although on different grounds, and Dr. Purcell will recover his damages with costs.

We cannot help sympathising with our professional brother in having such grave charges brought against him, particularly as after all, these charges were found to be without any foundation. At the same time we think, that both of these verdicts are very much open to criticism, and that if the decision of the Court of Appeal is to be a precedent in such cases, it will somewhat hamper the freedom of the press, and make journalists careful how they publish the reports of public meetings, during the proceedings of which reflections have been cast upon the character or conduct of any person. It must, however, be said, that the question at issue, or the point of law that was raised, is not one that can be settled so readily as some may imagine; an opinion which is borne out by the very different decisions respectively arrived at by the Court of Common Pleas and the Court of Appeal. The judgment of the former was anything but satisfactory, either in the interests of the public, or of the individual. It still left a difficult question to be decided, namely, what meetings may be said to be of public interest or concern? The meeting of some denominational society might certainly not be considered a matter of public importance; but should that circumstance preclude a journal from publishing a full report of its proceedings? If, again, a meeting of medical men was held to discuss the conduct of some member of the profession who had been acting in a dishonourable or discreditable manner, would a full report of it warrant an action for libel, merely on the ground that the object of the meeting was not one of public interest? The fact is, the distinction between meetings which are and those which are not of public concern, is not admissible in these cases. The law of libel is for the protection of the individual, and he would consider himself just as much aggrieved and his prospects just as much damaged, were the libel uttered at one kind of meeting as at another. Besides, the publication of the libel does away with the distinction. Directly the libel gets into the newspapers, it becomes a matter of public information, if not of public interest.

Perhaps the Court of Appeal saw the fallacy that was involved in the judgment of the other Court, for they ruled that the publication of a full report of what took place at a meeting was not justifiable, even if the proceedings were a matter of public interest.

This appears to us a thorough and sweeping decision, and at once throws the responsibility of making libellous assertions, not upon those who uttered them, but upon the publisher of the paper in which they are reported. We are not, however, on that account disposed, like an able contemporary paper, to condemn too hastily the decision of the Court of Appeal. At first sight it would seem more fair in such a case to punish the utterer, rather than the reporter of the libel, but not only is spoken libel, as distinguished from a written or printed libel privileged, when it can be shown that the utterer was speaking in the interest of the public, and while discharging a public duty, but it is evident that it must make a great deal of difference to the injured party, whether the charges brought against him extended little further than the precincts of the place where they were made, or were published to the world. That a charge brought against anyone at a public meeting by a person acting in a public capacity should be privileged, is we think perfectly just, but although we would for obvious reasons defend the rights of journalists, we must allow that there are difficulties in the way of according the same privilege to the press. If an individual be guilty of the conduct of which he is accused the publicity given to it at a public or *quasi* public meeting would be sufficient to secure his punishment in some form or other, and thus to satisfy the ends of justice. If, on the other hand, he is innocent of the charges brought against him, then the publication of them to the world would be nothing less than an intolerable act of injustice. It is true, that should the decision arrived at by the Court of Appeal be considered final in such matters, our newspaper reports will not in certain cases be able to be as "full and ungarbled" as some might desire. But surely a little garbling is somewhat excusable when a man's character is at stake, and especially when the accusations in question rest upon the bare assertion of the parties making them. At all events, the subject is one that requires very grave consideration; and when the

law of libel undergoes revision, as it very much needs to be, it is to be hoped that such a question as this, will receive the attention of those who are best qualified to settle it.

Notes on Current Topics.

The Intemperance Question.

A "FIRST DISTRICT" Conference, in connection with the Western Temperance League, was held on Friday week, at Newbury, the object contemplated by the promoters being to "elicit expressions of opinion as to the best means of diminishing the prevailing evil of intemperance." Mr. Walter, M.P., presided, and his observations and suggestions were marked by so much good sense and moderation, that they deserve the serious consideration of those whose attention is just now occupied with this important question. In the first place he very justly observed, that the evil of intemperance is, perhaps, much exaggerated, and that while so much is talked about the abuse of alcoholic stimulants and over-drinking, the evils resulting from over-eating are quite lost sight of. He also thought, as many others do, that the promotion of temperance among the working classes must be left in a great measure to the influence of education and to a general improvement in the moral and social condition of those classes. He was also of opinion that the cause of temperance would be much promoted if a less "heady" kind of beer was drunk by the people; something like the Bavarian ale, of which so much is consumed on the continent. This revolution would be a great advantage, as much of the drunkenness among the working-classes is due to the kind of beer they drink.

A Pocket Inhaler.

THIS age abounds in medical, as well as in other inventions, and we are continually coming across some ingenious contrivance by which a medicine can be more conveniently or pleasantly taken, or otherwise better adapted for the purposes for which it is employed than the means already in use.

One of the newest inventions of the kind is Austin's Pocket Inhaler, which will be found very useful in the treatment of catarrh, sore throat, hoarseness, and similar complaints. It consists of a simple glass tube, open at both ends, but fitted with cork stoppers. Inside the tube are seven or eight smaller tubes, made of some absorbent material, and the ends of which reach within an inch of the mouths of the glass tube. When in use the stoppers are removed, a small quantity of the inhalant is dropped into the small tube, or "case," as it is called, of the inhaler. The instrument is then charged ready for use, and as the ends of both the inhaler itself and the enclosed tubes are open, air freely mixes with the vapour of the substance inhaled.

There can be no doubt that the direct application of medicated vapours to the mucous membrane of the air passages is very much neglected, and one reason for this is the cumbersome apparatus usually sold for the purpose. One great recommendation of this inhaler is, that it is so small it may almost go into the waistcoat pocket.

More of the Irish Inquest System.

WE observe it recorded in a local paper that the Sligo county coroner held an inquest last week on the body of a man named Gilgan, who was found dead on the mountains. The wildest rumours were afloat as to how he came by his death—some that he was poisoned, and others that he met with foul play. A jury having been sworn, the first witness was his brother-in-law, Quinn, who said that deceased had been at a place a few miles on the other side of the mountain, and that he must have lost his life in crossing the mountain. He distinctly swore that he had not been in his company, or seen him for two or three days previous to his death. It may be judged with what surprise the jury heard from the next witness that Quinn and he were both in the company of deceased on the night he was lost! That all three were drinking together, and had come on their way together towards deceased's and Quinn's home, to a place where Harte had to turn off to his own home, and that deceased and Quinn were the worse of liquor. Naturally the jury wished to have Quinn recalled to rebut or explain his evidence, but he could not be found, so the coroner, having put the question to the jury, they, after some discussion and hesitation, brought in a verdict of "Died from exhaustion and exposure."

It would seem that there was no medical examination of the body, and, in fact, no evidence whatever as to the cause of death.

Short Cuts for Female Doctors.

"MISS ELIZA LOUISA WALKER-DUNBAR has received the licences in medicine and midwifery of the King and Queen's College of Physicians in Ireland. Miss Walker-Dunbar, who graduated as M.D. at Zurich in 1872, formerly held the post of House-Surgeon at the Bristol Hospital for Sick Children, which she resigned, however, on account of a disagreement with the staff. She has been engaged in private practice in Clifton. Miss Walker-Dunbar is the first lady whose name is enrolled as a licentiate of one of the Colleges of Physicians of the United Kingdom." This announcement, which has already appeared in another form in our columns, is one of the most pregnant announcements which has of late years occupied the attention of the profession. It is the record of the fact that Mr. Russell Gurney's Act of last session has drawn back the bolt and thrown wide open the gates of the medical profession to all comers. Those who have been readers of the MEDICAL PRESS AND CIRCULAR will be aware that we have throughout the whole controversy advocated the freest free trade in doctoring for the ladies. We have claimed for them neither more nor less favour than their male competitors are allowed; and, albeit, we have not the faintest belief in their ultimate success as practitioners, we have protested with all emphasis against the stupid policy of exclusion towards them. While, however, we are willing to give *place aux dames*, and to contest our foothold with them in the contest for public favour, we clamorously protest against any special favour shown to them and denied to male students. They have demanded to be admitted to the battle of medical life, and they have no right to anything more than "a clear stage and no favour." We are surprised to find that the Irish College of Physicians is bidding hotly for the patronage of

the lady doctors by accepting from them curricula which they would not receive from a male student. They have, we are informed, altogether exempted Miss Walker-Dunbar from examination in certain subjects in consideration of her holding the M.D. of Zurich. Thus they have recognised as evidence of competency a foreign degree which was unanimously refused admission of the profession last year, and which, if presented by a masculine medical student, would have been unhesitatingly refused. Of the degrees of the Zurich University the College has no knowledge, nor can it exercise any control whatever, and the acceptance of such a qualification is, in fact, a favour specially accorded to the ladies, and a bait for the patronage of the female medical students. As such we protest against it, and we ask the particular attention of the Medical Council to what we feel it necessary to characterise as an abuse of the qualifying powers of the College.

The Mutual Post-Mortem Association.

The *Medical Examiner* publishes in its last issue the text of the will subscribed by each member of the Societé d'Autopsie Mutuelle of France. Translated it is as follows:—"I, the undersigned, desire and wish that after my death my autopsy shall be made in order that the discovery of the deformities and hereditary diseases which may be found therein may serve as a guide for the use of the proper means to prevent the development of such conditions. I desire, moreover, that my body shall be utilised for the advancement of the scientific object which I have pursued during life. With this object I bequeath my body, and especially my head and brain, to the anthropological laboratory, in order that it may be used as may seem expedient, notwithstanding anything to the contrary of the execution of this bequest, which are my voluntary sentiments spontaneously expressed herein. The parts of my body which shall not be utilised shall be buried in the following manner." Each member of the society directs the ceremonial of his interment as he may see fit.

"Milk of Sulphur."

Mr. George Mee writes in the *Pharmaceutical Journal* a fair, honest, and straightforward view of the "milk of sulphur" controversy, which, as our readers already know, has been encumbered with all sorts of side issues which have nothing to say to the matter. "The milk of sulphur question," says Mr. Mee, "is on all fours with the coffee question. I for one decidedly prefer chicory mixed with my coffee, and believe it to be more wholesome than coffee alone. Decisions in abundance insist that when chicory is mixed with coffee a label stating the admixture shall be duly affixed; any one selling milk of sulphur with the pet admixture of lime sulphate is bound to disclose the same. There is not one law for coffee and another for milk of sulphur. Coffee unquestionably meant formerly the chicory admixture in practice, precisely the same as London milk meant cow produce and pumpenheimer." Special pleading will not convince any one that milk of sulphur is not an adulterated article. Whether the Pharmacopœia of 125 years ago contained it,—whether some customers prefer it,—whether it is more efficient than pure sulphur,—these considerations have nothing to say to the matter. The public is not aware that it is one-half sulphate of lime, and to sell it to them, concealing that fact, is not honest, and ought to be forbidden by law.

The Prevalence of Intemperance.

We are glad to see that last Friday the House of Lords on the motion of the Archbishop of Canterbury, appointed a Committee to inquire into "the prevalence of habits of intemperance." The object of this committee will be to inquire into the causes on which the prevailing intemperance of the working classes appears to depend and how far it has been influenced by recent legislation. We are far from thinking that people may be made temperate by act of parliament, but we highly approve of the step which the Upper House has thought proper to take as a large body of evidence will be accumulated and many valuable suggestions be made to mitigate an evil which is a disgrace to the country.

Health of the War Office.

Sir William Jenner and his colleagues have, says the *Sanitary Record*, completed the inspection of the War Office, which they were commanded by the Queen to make in reference to the detailed report of its sanitary unfitness which was recently made by the above journal. They have paid many visits to the building, selecting those times when the clerks had occupied the rooms during the day and were leaving the office. They have had the basement examined, and have satisfied themselves as to the state of the ventilation, and of the sanitary arrangements generally. We trust, with our contemporary, that some means will be taken to make this report public. Another clerk of the War Office is this week prostrated by typhoid fever, and therefore the sooner the real state of this government office is made known the better.

A Health Resort.

Under the above heading the *Times* publishes the following letter from a correspondent:—

"Kindly allow me a little of your space to bring into public notice the defective state of the drainage, and therefore of the sanitary condition of many parts of Southsea. Many houses are unconnected with the main drain and are drained into cesspits, the result of which in weather such as the present has been to fill up both cesspits and drains leaving the houses in a worse state than if not drained at all, for the sewage is forced back under them, and the consequences have been and are most fatal."

This fully accounts for the prevalence of typhoid fever at this place. We believe many cases of this fever have recently occurred at Southsea some of which have proved fatal. This watering place has the credit of being a very pleasant health resort, and of being, like Portsmouth, of which it is a sort of suburb, remarkably healthy. It is therefore to be hoped that the sanitary authorities of that town will lose no time in removing the stigma of bad drainage which is at present attached to it, and which the letter of the *Times'* correspondent has now made public.

Official returns for 1876 show that in Paris no less than 992 deaths resulted from typhoid fever in that city; fortunately the epidemic has now subsided.

The Water We Drink.

A DAY or two ago there appeared in one of the newspapers a letter from a correspondent residing at Lancaster Gate complaining of the bad condition of the water supplied to him by the water compony. Having sent a sample of it to a first-rate analyst, it was found to contain a considerable quantity of ammonia, nitrates, and nitrites, organic matters and chlorides, and sulphates also being in notable amount. The sanitary arrangements of the house, as regards tanks, &c., were found on examination to be quite satisfactory. The writer does not state whether his cistern had been properly cleaned out. Neglect in this respect is often the cause of a condition of the water for which the companies get blamed. If the water was found to be in such a state in such a residence as that at Lancaster Gate in what condition must it often be in those houses where great attention to cleansing is probably more frequently the exception than the rule!

Unqualified Assistants.

IN reference to the letter of our correspondent published in our last on the above subject, we decidedly agree with him in regarding many unqualified assistants as well acquainted with the requirements of the healing art as those who are in the profession, and more so in some instances. It is no doubt partly owing to this fact that the system of employing unqualified men has escaped the general censure of the profession, and that in many cases principals prefer a good experienced assistant without diplomas to one who may have half a dozen qualifications, but who is fresh from the hospital and his books. Nevertheless, this fact is no plea for the inconsistency of the profession and our medical authorities doing all they can in one direction to satisfy the public with properly qualified practitioners, while in another they allow the full liberty of practising medicine to a class of men whose qualifications have never been tested by any examination whatever. Our correspondent dwells upon the fact that many principals are in the habit of representing to their patients that their assistants are qualified when they are not. This circumstance only makes the matter worse, as it involves deception on the part of the principal, and induces the patient to place a degree of confidence in the assistant to which he can lay no claim.

Infant Mortality amongst Mill Workers.

THE certifying surgeon of the Belfast Factory district, in a recently published pamphlet, says that he regards the mother's return to the mill as almost a sentence of death to the child. Dr. Purdon has taken statistics from all classes, from which it appears that while only 15 per cent. of deaths take place in the upper class in the first two and a half years, and 20 per cent. amongst the artizan and labouring, 35 per cent. are cut off in the factory. The report says :—

"The oilers and tenters generally marry those who are employed in the same department with them, and very frequently both parties work in the mills and factories leaving the care of their offspring to the 'Baby Farmer,' who feeds them on improper diet, tea and whisky—and, in order to keep them quiet, different preparations of opium."

The object of the pamphlet is the establishment of creches for the care of those who are so entirely helpless and dependent.

The Metropolitan Hospital Saturday Fund.

A PUBLIC meeting of the council and supporters of the Hospital Saturday Fund was held on Saturday, at the Royal Infirmary for Women and Children, Waterloo Road, for the purpose of receiving reports of the past year's work, and declaring the awards due to each hospital, &c.; Captain Mercier in the chair.

The total amount of the past year's collection was £5,520 ; of this sum £4,250 was available for distribution, and the committee recommended the following awards :—Hospitals : London £393, Royal Free £134, Middlesex £193, St. George's £197, Charing Cross £107, King's College £131, Royal London Ophthalmic, University £116, Seamen's £97, West London £88, St. Mary's £85, Hospital for Sick Children £88, German £82, City of London (diseases of the chest) £81, Metropolitan Free £63, North Eastern, for Children, £52, Royal Westminster Ophthalmic £49, Samaritan Free £46, Royal National for Consumption £41, National Orthopædic £41, London Homœopathic £41, Evelina, for sick children, £45, East London, for children, £41, Victoria, for children, £35, St. Mark's, for fistula, £38, Royal South London Ophthalmic £31, Poplar £33, Royal, for diseases of chest, £32, Royal Fever £39, Hospital for Women £33, St. John's, for skin, £31, Hospital for Diseases of the Throat £35, St. Peter's, for stone, £24, Royal Infirmary for Women and Children £26, Invalid Asylum £24, Hospital for Nervous System £21, Home for Sick Children £23, French £24, City Orthopædic £26, Central London Ophthalmic £24 ; the other awards to hospitals were under £20. Convalescent Homes : Metropolitan £125, Mrs. Gladstone's Free £48, London and Dover £39, St. Andrew's £20. Dispensaries : Finsbury £30, Holloway and North Islington £30, Camberwell Provident £29, Chelsea, Brompton, and Belgrave £29, Islington £29, St. George and St. James £31, Western General £27, West Ham and Stratford, £26, Infirmary for Consumption £27, Metropolitan £24, Royal Kent £26, Royal South London £22, Westminster General £24, Clapham General £23, City £21 ; the remainder were under £20, making in all, 104 institutions.

Incomes of the London Charities.

OUR contemporary, the *Illustrated London News*, has been classifying the charities of the metropolis, with their individual and aggregate incomes, and the deductions therefrom show that the oft-repeated assertion that such incomes have seriously diminished has no foundation in fact, the sum total has increased last year over its predecessor by £139,268. The aggregate total is given as between £6,000,000 and £7,000,000. Of this gigantic sum eighteen general hospitals are put down as receiving £269,337 ; ten consumption hospitals, £45,911 ; five ophthalmic hospitals, £12,835 ; three orthopœdic hospitals, £4,019 ; four skin hospitals, £3,050 ; seventeen hospitals for women and children, £55,326 ; five lying-in hospitals, £7,076 ; twenty-two miscellaneous special hospitals, £89,294 ; thirty-three general dispensaries,

£23,003; fourteen provident dispensaries, £9,256; two institutions for vaccination, £2,750; five ditto for surgical appliances, £10,337; thirty-five convalescent institutions, £39,719; twenty-four charities for the blind, £47,622; seven for deaf and dumb, £16,276; nine for incurables, £38,232; six for idiots, £68,885; thirteen nursing institutions, £3,642; 172 institutions for the aged, £400,411; ninety-eight institutions for general relief, £283,797; twenty-six food institutions, £9,448; fifty-four orphanages, &c., £160,288; sixty-seven institutions for reformation and prevention, £94,776; sixteen ditto for protection, £63,983; making in all 1,050 institutions.

THE number of deaths from small-pox in the twenty-two large towns and cities of the United Kingdom rose last week from 113 to 130. Of these, 103 occurred in London, 19 in Liverpool, and 8 in Manchester and Salford.

DR. LE MOYNE, the owner of the Washington cremation furnace, has endowed a Professorship in the Washington and Jefferson College, and expended 10,000 dollars in founding and endowing a town library.

PROGRESS OF THE SMALL-POX EPIDEMIC.

AT the fortnightly meeting of the managers of the Metropolis Asylums Board, on Saturday last, Dr. Brewer in the Chair, Mr. Barringer, as chairman, brought up a report as to the Homerton and New Limehouse Hospitals. During the past fortnight, 178 additional small-pox patients had been admitted into the Homerton Hospital, 39 had died, and 199 had been discharged or been transferred to the Limehouse Hospital, which was opened for the reception of convalescent small-pox cases on Monday, the 29th ult., from which date to the 9th inst. 51 patients had been removed from Homerton, and 8 from Stockwell Hospital while three have been discharged recovered. The report was received. A report was presented from the committee appointed as to the new Fulham and Deptford Hospitals, which stated that the contractors had made good progress, and that if the continued pressure of small-pox epidemic had required it, both these hospitals would have been ready for the reception of patients on the day originally named—Thursday, the 15th instant. The pressure having for the moment at all events, slightly diminished, the committee had fixed Monday, the 19th instant, as the day on which the subordinate staff will commence duties, and within a very few days the committee will be prepared to receive patients; although the number of patients at the moment in the several hospitals of the managers is not greater than it has been for some weeks past. The committee, after anxious deliberation and consultation with the other hospital committees, came to the conclusion that it was desirable to open these additional hospitals with as little delay as possible, and made the following recommendations: First, that the Homerton Fever Hospital should be restored to its original purpose as soon as possible; secondly, that it is expedient to reduce the numbers in the small-pox hospitals at Homerton and Stockwell to those for which they were originally certified; thirdly, that to give effect to the recommendation of the select committee of the House of Commons that the other districts of the metropolis should bear equally with Hampstead the annoyances of an infectious hospital, it would be the wish of the managers to open the new sites during the present epidemic; and, fourthly, that although the temporary hospital at Limehouse was a fitting place for the cure of convalescent patients during a time of extreme pressure, the managers would desire to carry out the principle on which they always acted and treat their patients in more isolated localities immediately that it was possible for them to do so.

Correspondence.

ETHER INHALATION.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In reply to your criticism on my portable regulating inhaler (Jan. 31st) I beg to say that the difference between it and the other inhalers you mention is not merely in my having placed the ether in a reservoir instead of a sponge, but in the arrangements for regulating the strength of the vapour without admitting fresh air.

The instrument in question is a more portable form of the "Gas and Ether Inhaler" I have been using for three years, and described in the *British Medical Journal* of July 15, 1876, the gas part being left out. This gas and ether apparatus was the result of several alterations of my nitrous oxide inhaler published in the same journal, Nov. 7, 1868. This had a supplemental bag which economised the gas and acted the same part towards the gas which the india-rubber diaphragm in Dr. Morgan's inhaler afterwards did for ether.

I abolished the supplemental bag on finding that by means of a lever I could keep the inspiring-valve open when I wished, and so make the patient breathe backwards and forwards, out of and into the bag containing the supply of gas.

The next alteration was the arrangement for making the supply of gas pass through a vessel containing ether. The lungs were cleared of air by breathing pure gas and then ether was added. I described this amongst other ways of giving anæsthetics in a paper read before the British Medical Association in London in 1873. It was at that time, as far as I know, the *only* way by which ether could be inhaled without air. I had not then sufficiently mastered some of the difficulties in my way, and was using for all long operations the double current inhaler to which air was constantly supplied.

At the same meeting Dr. Morgan explained his apparatus. He laid much stress on the advantages of exclusion of air, but inasmuch as he had about 200 inches of air in his apparatus to begin with, and allowed air to get under the face-piece if the vapour was too pungent, or opened a funnel placed on purpose for admitting air into the ether-vessel, and, moreover, spoke of the blood retaining the arterial colour, I do not think, in practice, he so effectually excluded air as he might have done by the old plan of using a bullock's bladder or the American way of using a large cup-shaped sponge.

In the monograph Dr. Morgan sent me, he speaks of eight minutes as the ordinary time for procuring insensibility when his inhaler was used. That is, in itself, a proof that air was not excluded.

Both the inhalers which you suggest I have not duly acknowledged, have apertures for the purpose of admitting air when the vapour is too strong. In my instrument, if the vapour should be increased so rapidly as to produce any sign of local irritation, by simply turning the regulator the atmosphere is made less pungent without admitting fresh air.

The vessel holding water to prevent the ether becoming too cold is another feature distinguishing it from them.

Let me add that I think it a mistake to say that the intoxication, &c., depend on the mixture of air with the ether vapour. Whatever plan is used, we ought to give some air when convulsive twitchings, deep coma, intermittent breathing, or failing pulse is observed.

The intoxication depends upon the continuance of ether in the blood and tissues, and by combining deoxidation with etherizing, we can accomplish the narcotism required without so much ether as usual getting into the system.

I am, Sir, yours faithfully,

J. T. CLOVER, F.R.C.S.

3 Cavendish Place, London, W.

VETERINARY SURGEONS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In a foot-note appended to a letter which appeared in your issue of the 7th instant, you state that "There is no legal qualification for a Veterinary Surgeon." Will you permit me to refer you to the Royal Charter granted by her most gracious Majesty the Queen, in the seventh year of her reign, constituting all such persons as had then been educated at the Veterinary Colleges of London and Edinburgh, and who had obtained certificates of qualification to practise as veterinary surgeons, and such other persons as there were or might thereafter become students of the said Colleges, &c., members of

one body politic and corporate, by the name of "The Royal College of Veterinary Surgeons," by which name they should have a perpetual succession and a common seal.

I presume that you will admit that all persons who have studied veterinary medicine, and entered the profession, under the provisions of such Royal Charter, are *legally* qualified to practise as veterinary surgeons. At present there is no penal clause to prevent unqualified persons *assuming* the title, and practising as veterinary surgeons, which is, I think, greatly to be regretted; but as your remarks convey an erroneous impression as to the legal qualification of the members of the Royal College of Veterinary Surgeons, I trust you will insert this note. I have confidence in appealing to your sense of justice to do so, from having observed that you recently enriched your pages with original contributions by an eminent veterinary surgeon, Mr. G. Fleming; and I trust that neither you nor your readers considered it *infra dig.* to the profession the MEDICAL PRESS AND CIRCULAR represents, that Mr. Fleming selected it as one channel through which to convey information on medical subjects, equally interesting and instructive to the enlightened medical and veterinary practitioner, whose paths run side by side in scientific research, so that the one may often assist the other, but neither can despise the sister science without suffering loss in his own, whether it be the medical or veterinary branch.

Your obedient servant,

ALFRED J. OWLES,

Staff Veterinary Surgeon.

[We do not for a moment desire to depreciate the scientific value of veterinary surgery, or the status of that profession. We simply desired to state that there was nothing to prevent any person—competent or incompetent—from practising in that line, and calling himself anything he pleases. We do not consider it *comme il faut* for a medical practitioner to take fees as a vet., while at the same time holding office as a surgical practitioner. The combination of functions does not seem desirable from any point of view.—ED. M. P. & C.]

ETHER INHALERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Allow me to make a few observations in reply to your comments on my letter of the 31st ult.

Skinner's inhaler, when *properly applied*, excludes the *atmospheric air*. The *expired air* is, however, allowed to re-enter the lungs, a circumstance which owing to the quantity of carbonic acid in expired air rather accelerates anæsthesia than otherwise. That carbonic acid is itself anæsthetic is a well-known fact exemplified in the case of those who are charred in lime-kilns. I have tried many inhalers and have witnessed the employment of Dr. Ormsby's, and have arrived at the conclusion that Skinner's is the most efficacious in all repects.

I am, Sir, yours very truly,

FRANK THORPE PORTER, L.R.C.S.I.

15 Upper Merrion Street, Feb. 9, 1877.

[A patient lying on the operating-table emits say thirty cubic inches each expiration, and requires the same amount to fill his lungs again. Skinner's inhaler is a cone of about six cubic inches capacity. It is, therefore, pretty plain that twenty-four cubic inches of expired air must get out somewhere no matter how perfectly the inhaler is applied, and must be replaced by fresh air at next inspiration. *Ergo*, a very large dilution of the ether vapour must take place. Hence, if our opinion as to the necessity for exclusion of air be correct, Skinner's inhaler must prove ineffective in the long run.]

THE IRISH COLLEGE OF PHYSICIANS AND THE BALLOT QUESTION.

MANY of our readers are aware that for a couple of years the Irish College of Physicians has been exercised upon a reform of its ancient electoral system which had, up to that time, been a close ballot without examination, and which had been very emphatically condemned by the visitors of the College. This condemnation rendered necessary some change, and it was decreed by a vote that the Fellows, who are not only the corporation, but the governing body also, should determine to declare a certain number of vacancies in their own body, and then proceed to elect by ballot. After consideration of certain other proposals, it was decided to apply to Government for a new charter, in which the perpetuation of the ballot was the prominent feature. Sir Michael Hicks Beach, the Chief Secretary for Ireland, has recently returned his reply to this request in form of the following memorandum.—

Memorandum of conversation of President and Vice-President with the Chief Secretary, on Friday, December 29th, 1876

The Chief Secretary said he was anxious to see us in reference to the application of the College for a new Charter.

He said that he did not like the notion of election by ballot for the Fellowship; but that if the Fellows were elected by examination or otherwise, and that a Council was established, he saw no objection to the election from the body of Fellows to the Council by ballot.

The Chief Secretary also stated that, in his opinion, the by-law under which a lower fee was charged to candidates in arts of certain universities than to other persons, was contrary to the spirit of the Act of 1862 (25 Vict., ch. 15), and that it had been so represented to him by the Queen's University.

With regard to the formation of a new order of members, the Chief Secretary considered that the enlargement of the number of Fellows, and the establishment of a Council, would render this unnecessary, inasmuch as he presumed that the higher order of fellowship would entitle the holders thereof to all privileges attainable under a new order of members.

With regard to the power of receiving the resignation of a Fellow, the Chief Secretary saw no difficulty, as a matter of policy, in the introduction of such a clause in any new Charter which might be granted.

And lastly, the Chief Secretary suggested that in future the by-laws of the College should be submitted to the Privy Council for their approval, before they become binding on the College.

The Chief Secretary desires it to be distinctly understood that the law officers of the Crown have not yet been consulted on the above suggestions, as they have not yet been put into a definite shape; and that the views which he has expressed with regard to them, are subject to the opinion of he law officers on points of law.

Without entering into unintelligible detail, we may point out (1) that the Chief Secretary entirely disapproves of the election of Fellows by ballot alone; (2) that he disapproves of the continued administration of the College by the whole body of Fellows who are endowed with absolute caprice as to who shall be of their conclave, and who shall not; (3) that he wishes to provide for new Fellows, and the enlargement of the College, by establishing an administrative Council, such as exists in the Irish College of Surgeons and elsewhere.

The proposals of Sir Michael Beach are perfectly reasonable, and in accord with the experience afforded by other licensing corporations. They are calculated to remedy, without risk to the efficiency of the College, the very great faults of the existing system, and to confer great benefits upon the Licentiates of the College—by throwing open the Fellowship which is now, to all intents, hermetically closed to most of them. It would give impetus to the College financially and morally, and free it of the atmosphere of mediævalism which impedes its growth; yet we regret to learn that the Fellows have decided to reject the Chief Secretary's suggestion, and stick to the ballot with all its abuses and injustices.

There is nothing new or surprising in the fact that a self-elective body objects to the disturbance of its balance of power by the introduction of new members, but it seems to us that if the Licentiates of the College ever

mean to occupy any position in their college, the time has come to throw their influence into the scale in support of the reforms suggested by the Chief Secretary. Like some of its sister corporations the College is behind the age, and the idea seems to rule within its walls that the institution is a pleasant club, into which any person coming without suitable introduction should be treated as an intruder. This is not our idea of a corporation discharging a public duty as a licensing body, and we are glad to find that we hold this opinion in such distinguished company as that of Her Majesty's Chief Secretary for Ireland.

Obituary.

SIR WILLIAM FERGUSSON.

Sir William, whose lengthened illness has long been known to all, died on Saturday evening last, at his house in George Street. He was one of the ablest of surgical operators, and as such his place cannot be refilled. He was remarkably self-possessed and deliberate, never moving a hand without effecting some part of the operation. In operative surgery he excelled; his equal we have never yet seen. As a surgeon he was both bold and cautious, yet truly conservative, always avoiding an operation when possible, but never shrinking from it when necessary. He possessed a refinement in touch, and a delicate manipulation which placed him above every surgeon of his day.

For some time Sir William had suffered from albuminuria, and during the greater portion of last year he was unable to devote himself to practice.

For a time it was doubtful whether he would again engage himself in his duties, but towards the beginning of the last winter session he found himself well enough to return to hospital work. During the past fortnight some symptoms of uræmic poisoning exhibited themselves, and he gradually sank.

Sir William was born on the 20th March, 1808, at Prestonpans, East Lothian, and was educated at the University of Edinburgh at the expense of his uncle, Colonel Fergusson, his intention being to study for the law; but in the year 1825 he became a pupil of the celebrated anatomist, Robert Knox, and took the diploma of the College of Surgeons of Edinburgh. In association with Knox he taught anatomy for some years, and prepared many dissections, which are now to be seen in the museum of the College of Surgeons of Edinburgh. It may be recollected by some that in consequence of the resurrectionists and the murders by Burke and Hare, Robert Knox was obliged to leave Edinburgh, but Mr. Fergusson continued to teach anatomy.

In 1831 he established himself as an extra-mural lecturer on surgery, and was soon afterwards appointed surgeon to the Royal Infirmary, where his dexterity as an operator first displayed itself. In 1840, when a medical school and hospital were established in connection with King's College, London, the appointment of Professor of Surgery was offered to Mr. Fergusson, who was then 32 years of age. It was a serious matter for him to decide upon. He felt confidence in himself that if he remained in Edinburgh he should do well, but he scarcely dared to contemplate a change into London, to rival surgeons who had already attained European eminence. He, however, accepted the office, and commenced practice in London at a house in Dover Street. It is needless to say that his fame as an operator soon spread through London and through the world, and great indeed is the number of surgeons of all nationalities who have gone to King's College Hospital to profit by witnessing operations performed by him.

In 1842 he published a work on practical surgery, and in 1849, on the death of Mr. Key, he was made Surgeon-in-Ordinary to Prince Albert. In 1855 he became Surgeon-Extraordinary to the Queen. In 1866 he was created a Baronet, and in the following year was made Sergeant-Surgeon to the Queen. Sir William was Examiner at the College of Surgeons of England for a short time only, other calls on his time being so numerous.

As Professor of Surgery at the London College of Surgeons he delivered two courses of lectures on the Progress of Surgery, and in 1870 was elected President. The following year he gave the Hunterian oration.

His writings, though not published in lengthy volumes, are numerous and scattered, and neither time nor space will permit us to do justice to a report on the advance of surgery initiated by him. To him almost entirely we owe the present state of "Conservative Surgery."

His introductions in re-sections of joints, hare-lip, cleft palate, lithotomy, must ever indelibly imprint his name on time as the surgeon of this century.

Medical News.

Army Medical Department.—The Director-General of the Army Medical Department presents his compliments to the Editor of the Medical Press and Circular and begs to enclose a list of Candidates of Her Majesty's British Medical Service who were successful at the examination in London in August, 1876, and who have passed through a course of instruction at the Army Medical School:—

SANITARY INSTITUTE OF GREAT BRITAIN.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Will you kindly permit me to inform your readers that the Sanitary Institute propose to hold a public meeting early in March next at the Society of Arts to consider the report recently issued by the Committee appointed by the President of the Local Government Board upon "The Modes of Treating Town Sewage." His Grace the Duke of Northumberland will preside at the meeting, and the discussion will be opened by Sir Joseph Wm. Bazalgette, C.B.

Gentlemen desirous of taking part in the discussion will greatly oblige by forwarding to me their names and the heads of the subjects on which they desire to speak.

I am, Sir, your obedient servant,

11 Spring Gardens, London, S.W. LORY MARSH, M.D., *Sec.*

MR. F. M. TODDY is thanked for his kindly interest. His communication received as we were going to press shall appear in our next.

G. P. B., Mentone.—For a university student, Carpenter. For a hospital student, Küss or Kirke. We know of no work which answers your second question. Perhaps the nearest approach will be found in the little pocket "crams" in the Students' Aid series.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—Will you kindly say where I may get a good brief article on *Thermometry* applied to disease. What of *Aitken's smaller* volumes on the "Practice of Medicine?" And would it be practically as valuable to the busy "rural" practitioner as the larger book? Watson's last edition disposes of the thermometer curtly enough.

Yours truly,

H. J.

[There is not any small work on medical thermometry. A brief article in the *Dublin Medical Journal*, Vol. 53, p. 101, 1872, contains an abstract of the principle points in medical thermometry taken from Winderlich's great work.—ED. M. P. & C.]

THE PREJUDICE AGAINST MEDICAL STUDENTS.—A correspondent gives what he considers another instance of unfairness in the administration of the law. He was at one of the London Police-courts on Monday last for a short time and heard the "night charges" for drunkenness disposed of. The fines ranged from 3*s.* to 1*s.* each, except in the case of a medical student, who was fined 6*s.*, although his case offered less aggravated circumstances than any. Our correspondent is naturally indignant at this, and thinks that the shame of such a charge being proved is quite serious enough without the infliction of a double fine. We are quite in accord with our correspondent against the injustice of dealing out different laws because the individual charged happens to be a medical student, and we fear with him that it is another instance of that prejudice one is unfortunately accustomed to see shown against medical students. But we feel less regret in this instance, as the accused should not have given the magistrate the opportunity of comparing his case with less educated men.

HUNTERIAN SOCIETY.—The Annual Oration will be delivered this evening (Wednesday) at 8 o'clock by Dr. Moxon. There will be a meeting for the election of officers half-an-hour previously.

HARVEIAN SOCIETY OF LONDON.—On Thursday evening at 8 o'clock Dr. de G. Griffiths, "On Fæcal Collections simulating Utero-ovarian Disease."—Mr. Osman Vincent, "On the Anatomy, Pathology, and Treatment of Knock-knee."

PROF. PARKER will lecture at the Royal College of Surgeons of England on Friday at 4 p.m. "On the Osteology of Birds."

MEDICO-CHIRURGICAL SOCIETY OF LONDON.—On Tuesday evening the Ballot opens at 7.30 and closes at 8.30. After which various papers are set down for reading.

THE TITLE OF DOCTOR.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—Wishing to compliment a medical gentleman lately on his addition of Dr. to his name and door-plate, I asked what university conferred on him the degree. His answer was, "I am a licentiate now of the Royal College of Physicians of London and take the title of doctor by right of courtesy." He said others did it why should not he? Now, Mr. Editor, who is to question this new title; the College is evidently afraid; who is to do it? Let me and others know.

Yours truly,

M. D. DE JURE.

P.S.—I shall never meet a medical doctor "by courtesy" in consultation till I learn he is entitled by law and does not visit for, or prescribe for, a few coppers per head.

ART IN HOSPITALS.

To the Editor of the MEDICAL PRESS AND CIRCULAR.

SIR,—A misapprehension has arisen as to the *bond fides* of my offer of a hundred guineas towards a fund for introducing art into hospitals, because of the condition that 1,000 subscribers should each also contribute a similar sum. I withdraw such condition. I will gladly give one hundred guineas to a responsible committee, as soon as one is formed, to promote the Art Fund of the Hospitals of London.

I am, Sir, your obedient servant,

J. LAWRENCE-HAMILTON, L.R.C.P.

34 Gloucester Terrace, Hyde Park, W.

[*** The idea of collecting and expending a sum of one hundred thousand guineas on art treasurers, old china, bric-a-bac, &c., for our hospitals was no doubt a grand conception, but we think it rather fortunate that the public declined to respond to the appeal for the reasons stated in our issue of Jan. 31st.—ED. M. P. & C.]

VACANCIES.

Kent County Lunatic Asylum.—Assistant Medical Officer. Salary, £150. Testimonials to Messrs. Beale and Hoare, Maidstone.

Dorset County Hospital.—House Surgeon and Secretary. Salary, £80, with board. Applications, under cover, to the Chairman at the Hospital, Dorchester.

Coventry Hospital.—House Surgeon. Salary, £100, with board. Applications, under cover, to the Secretary.

University College Hospital.—Secretary. Medical qualifications not necessary, but business competence. Testimonials to the Secretary of Council, Gower Street, London, W.C.

Halifax Infirmary, Yorks.—Assistant House Surgeon. Salary, £50, with board. Testimonials to the Chairman of the Medical Staff

Cheltenham Hospital.—Junior House Surgeon. Salary, £80, with board. Applications to the Secretary.

Brighton Lying-in Institution.—House Surgeon. Salary, £120. Testimonials to the Chairman of Committee, 76 West Street.

Dunboyne Dispensary, Dunshaughlin Union.—Medical Officer. Salary, £110. Applications to Hon. Sec.

Gort Union.—Apothecary. Salary, £40. Applications to Hon. Sec.

Taunton Union.—Medical Officer. Salary, £52, with extra fees. Address the Secretary.

Chelmsford Union.—Medical Officer and Public Vaccinator. Salary, £48, with fees extra. Applications to the Clerk of the Guardians.

Newport (Mons.) Infirmary.—Resident Medical Officer. Salary, £100, with board. Applications, with testimonials, to the Chairman of the Infirmary.

Crediton Union.—Medical Officer for the Cheriton Fitzpans District. Salary, £15, with usual extra fees. Address the Clerk to the Guardians.

BOOKS, PAMPHLETS, AND MEDICAL JOURNALS RECEIVED

A Handbook of Hygiene. By George Wilson, M.D. Third Edition. London: J. and A. Churchill.

Outline Diagram Forms for Clinical Case-Books. By G. Rowell, M.D. London: Smith, Elder, and Co.

How to Use a Galvanic Battery. By Herbert Tibbitts, M.D. London: J. and A. Churchill.

APPOINTMENTS.

AVELING, J. H., Obstetric Physician to the St. Marylebone General Dispensary.

CRICHTON, J. S., M.D., L.R.C.S Ed., Medical Officer and Public Vaccinator for the Parish of Arbirlot, Forfarshire.

DAVY, J. W., M.B., C.M., Resident Assistant House Surgeon to the North Dispensary, Liverpool.

FINLAY, D. L., M.D., Medical Registrar to the Middlesex Hospital.

JONES, H. T., L.K.Q.C.P.I. and L.M., M.R.C.S.E., Medical Officer of Health for the Hucknell-Torkard Urban Sanitary District, vice McDermott.

MACDONNELL, H. H., M.B., C.M., Surgeon to the Louth County Infirmary, and to the County of Louth Gaol, Dundalk.

MUIRHEAD, C., M.D., F.R.C.P.Ed., has been promoted to third Ordinary Physician to the Royal Infirmary, Edinburgh.

SMITH, G. F. K., F.R.C.S.E., a Surgeon to the General Infirmary, Northampton.

STRUGNELL, Mr. F. W., Resident Surgeon to the Small-pox Hospital, Highgate.

Births.

ANTHONY.—On the 12th ult., at Fort Agra, India, the wife of Mark Anthony, M.D., Surgeon Royal Artillery, of a daughter.

BRAMWELL.—On the 5th inst., at 31 Percy Gardens, Tynemouth, the wife of J. W. Bramwell, M.B., of a daughter.

DARBY.—On the 6th inst., at Monasterevan, the wife of Dr. Darby, of a daughter.

MCCARTHY.—On the 5th inst., at Bridgemount Abbeyfeale, the wife of John P. McCarthy, M.D., of a son.

Marriages.

TREVES—MASON.—On the 8th inst., at Holy Trinity Church, Sydenham, Frederick Treves, M.R.C.S., of Wirksworth, Derbyshire, to Anne Elizabeth, younger daughter of Alfred S. Mason, of Sydenham Park, S.E.

Deaths.

POWER.—On Jan. 25, at Mannheim, Baden, John Livingstone Power, L.R.C.P.Ed., Surgeon-Major 4th Regiment.

SMITH.—On Jan. 24, at Winchcomb, Gloucestershire, Samuel Smith, M.R.C.S.E., aged 68.

SPONG.—On Jan 31, at his residence, Albion Terrace, Faversham, Kent, William Nash Spong, F.R.C.S., aged 30.

STACE.—On Jan. 23, at Southampton, Joseph Stace, M.R.C.S.E., formerly Surgeon H.E.I. Co.'s Service, aged 92.

IRISH POOR-LAW INTELLIGENCE.

SANITATION *v.* EXPLOSION.

In an editorial note which appeared in our issue for the 20th of December last we referred to the report of the proceedings of the Castlebar Guardians, contained in the local paper. It seemed from that report that Mr. H. C. Larminie had been appointed Inspector under the Explosives Act of 1875, at a salary of £20 a year, and that the Local Government Board had expressed its opinion that such appointment was unnecessary. Not having the reports of previous meetings of the guardians, nor the text of the Explosives Act, before us, and judging principally from the letter of the Local Government Board, we assumed (incorrectly, as it now appears) that the appointment had been made by the Board of Guardians, of whom Mr. H. C. Larminie and his brother (Mr. A. Larminie) are members; and we compared the taste with which the appointment had been made, and the salary attached to it, with the unwillingness of guardians to appoint their sanitary officers, and the small remuneration granted to them. We have been informed that Mr. H. C. Larminie and his brother consider that an injustice has been done them by our observations, and—with the desire of setting ourselves right if we had committed any error in the matter—we have obtained the files of papers containing the reports of previous meetings of the guardians, and have examined the Act under which the appointment was made. As the result of this further inquiry we find that the power of making local appointments under the Act is vested by Clause 67 in the "local authority" which is defined to be "in any place in which there is no local authority otherwise defined—the justices in petty sessions assembled." By Clause 69 "It shall be the duty of every local authority to carry into effect within their jurisdiction the powers vested in them under the Act," and in other parts of the Act officers are spoken of as acting on behalf of the local authority, but there is no clause which orders the appointment of any such officers, and it would seem to be left entirely to the discretion of the J.P.'s whether they will appoint or not.

By clause 70, it is provided that

"All expenses incurred by the local authority in carrying into effect the execution of this Act, including the salary and expenses of any officer directed by them to act under this Act shall be paid out of the local rate," that source being, in the case of a rural district, described as the county rate.

It is, therefore, obvious that we were led into error by the ambiguity of the letter of the L.G.B., and by our unacquaintance with the Explosives Act, and that neither the Board of Guardians nor the Messrs. Larminie were in any way responsible for the appointment, but that the responsibility lay altogether with the justices at petty sessions. Nay, more! we find that the Guardians had discouraged with all their energy the creation of a new, and, perhaps, unnecessary burthen on the ratepayers, and had actually appealed to the L.G.B. against the act of the justices in taxing the Union with a new salary. We take the earliest opportunity, therefore, of repudiating any idea that influence was, or could have been, exercised by the Messrs. Larminie with the Board of Guardians for personal objects, or that the Guardians could have yielded to such influence if it had been exerted. We regret having been betrayed into a mistake as to the law of the matter, and if the Messrs. Larminie consider that our observations involve any imputation on them, we unhesitatingly withdraw any phrase which is capable of bearing such interpretation, and express our regret for appearing to have done them an injustice.

THE CARLOW WORKHOUSE ELECTION.

We have received a long letter from Dr. Thomas P. O'Meara, in reference to the recent election of Dr. Rawson to the Carlow workhouse, and anent our observation respecting the issue by Dr. O'Meara of a circular to the electors, in which the offices held by his opponent were set forth with the purpose of showing that the duties of the office could not be efficiently discharged by him. We stated that the issue of such a circular was neither creditable nor professional. We must be excused publishing Dr. O'Meara's letter, not at all from any desire to deny justice to him, but because it deals only with Dr. Rawson's merits and demerits, with which question we have nothing to do. That subject was for the consideration of the guardians; they had the subject before them, and could, if they desired, have all the facts before them, and they —not the Medical Press—are the judges in the matter Our concern is with the issue of a circular, depreciatory of an opponent, and we repeat that such a course is not *en regle*.

A candidate for office should recommend himself to the electors, not by crying down his opponent, but by crying

up himself, and however he may—verbally—represent the incapability of any other candidate, it is certainly not a professional or creditable course to publish such detraction in circular form. Dr. O'Meara complains that Dr. Rawson had made his canvass and secured voters in advance of his father's resignation. We do not think it desirable that appointments should be obtained by this process, but, after all, it is a matter for the electors, who ought to have the discretion not to pledge their votes without knowing the candidates. If they are so inconsiderate as to do so, we can hardly blame any candidate for taking them at their word. We think it right to publish the last paragraph of Dr. O'Meara's letter, which does justice to his principles:—

"I regret exceedingly that the politico-religious element was introduced into the contest. This was done by Dr. E. Rawson's friends in the first instance, and subsequently by some articles in the —— ——. The latter I never saw, nor do I know anything whatever about them. I am exceedingly sorry that politics or religion should ever be introduced into affairs of this kind, and I trust I shall always endeavour, as I have hitherto done, to eliminate such bitter elements from matters that should be purely professional."

We most cordially participate in Dr. O'Meara's views on this point, and deeply regret that the choice of the most competent attendant for the sick poor should resolve itself, as it often does, into a despicable squabble between contra-religionists and opposing politicians.

The Vital Statistics of Ireland.

THE annual report of the Irish Registrar-General just issued states that during the year 1876 there were registered in the Dublin district 9,006 births, a ratio of 29 per 1,000 of the population. The average in the preceding ten years was 28 per 1,000. In London the number was 36 in every 1,000, in Glasgow 58 per 1,000, and in Edinburgh 33 per 1,000.

8,097 deaths were registered in the Dublin district during the year, being 25.7 in every 1,000 of the population, against an average death-rate of 26.4 per 1,000 for the previous ten years. The death-rate of the north side of the river was 28 in every 1,000, and on the south side 27 per 1,000. In the suburban districts of Rathmines, Donnybrook, Blackrock, and Kingstown, the number of deaths was 20 in every 1,000 of the population.

The deaths registered in Belfast afford a ratio of 25 in every 1,000, in Cork, 27 per 1,000; in Limerick it was 27, in Londonderry 18, in Waterford 23, in Galway 22, and in Sligo 18. The death-rate of London was 22 in every 1,000, of Glasgow 25, and of Edinburgh 20.

The number of deaths in the Dublin district referred to zymotic diseases was 45·1 in every 10,000 inhabitants, being 468 less than the average annual number for the preceding ten years, and lower than in any of those years except 1873 and 1875, in which deaths from these diseases numbered respectively 1,378 and 1,396. There were 9 deaths from small-pox registered—1 in the third quarter and 8 in the fourth. Fever caused 260 deaths, being 13 more than in the preceding year, but 86 under the average annual number for the ten years 1866-75. The deaths from fever were tabulated as follows:—Typhus 62, enteric 151, and simple continued fever 47. The increase on the number in 1875 was confined to typhus, only 49 deaths from which were registered in that year. The deaths from scarlet fever number 194, being slightly over the mortality in 1875, but little more than half the average annual number in the years 1866-75, the disease having been very fatal in 1869 and 1874. Whooping-cough caused 195 deaths, 112 of which were registered in the first quarter; measles proved fatal in 133 instances; croup in 73; diphtheria in 25; quinsy in 7; and erysipelas in 47. There were 243 deaths ascribed to diarrhœa; this number is 31 under the average for the previous ten years. Bronchitis proved fatal in 1,282 instances, or 4 per 1,000 of the population. This mortality, though over the average, is less than that in the year 1875, when 1,379 deaths from bronchitis were registered. Of the 1,282 deaths from this disease, 597 were registered in the first quarter of the year. Pneumonia caused 242 deaths, pleurisy 22, asthma 17, laryngitis 6, and lung disease unspecified 143, the deaths from diseases of the respiratory organs (exclusive of phthisis) thus amounting to 1,712, or 21 per cent. of the deaths from all causes, and equal to 54 in every 10,000 inhabitants, which is considerably over the average, but not so heavy as the mortality in the preceding year. As many as 594 deaths (almost exclusively children) are ascribed to convulsions. Apoplexy was assigned as the cause of death in 101 instances, paralysis in 154, cephalitis in 52, epilepsy in 30, insanity in 10, chorea or St. Vitus's dance in 2, and brain disease unspecified in 129. There were 390 deaths referred to heart disease, 34 to aneurism, 7 to pericarditis, 13 to jaundice, 8 to inflammation of the liver, 99 to liver disease, 2 to spleen disease, 33 to Bright's disease, 8 to inflammation of the bladder, 4 to inflammation of the kidneys, 3 to ischuria, 2 to diabetes, 1 to stone in the bladder, and 83 to kidney disease unspecified. Phthisis caused 931 deaths; this number, which is equal to 29·6 in every 10,000 of the population, is 57 under the average for the ten years 1866-75, and is less than the mortality in any of those years except 1874, when only 862 deaths from phthisis were recorded. There were 604 deaths from other constitutional diseases, including 171 from hydrocephalus, 127 from mesenteric disease, 51 from scrofula, 142 from cancer, and 6 from gout; the total deaths from this clase of diseases being equal to 48·8 in every 10,000 inhabitants, against an average of 52·7 for the preceding ten years. There were no deaths from small-pox registered in any of the seven provincial town districts.

The deaths registered in Belfast include 149 from whooping-cough, 105 from fever, 86 from scarlatina, 15 from diphtheria, 13 from measles, and 165 from diarrhœa; these 533 deaths being equal to 12 per cent. of the total deaths, and 2·9 per 1,000 of the population. In the year 1875 the deaths from the seven principal zymotic diseases were equal to 6·1 per 1,000 persons, scarlatina having caused 356 deaths, and measles 280.

In Cork last year there were registered 68 deaths from fever, 40 from measles (30 of which were recorded in the first quarter), 30 from whooping-cough, 17 from scarlatina, 6 from diphtheria, and 80 from diarrhœa, the rate afforded by these 241 deaths being 2·6 per 1,000 of the population.

There were no deaths from diphtheria, measles, or small-pox registered in Limerick during the year. The mortality from the other principal zymotic diseases yield a rate of 2·9 per 1,000 persons, the number of deaths being 126—viz., 39 from whooping-cough, 34 from fever, 17 from scarlatina, and 36 from diarrhœa.

Of 559 deaths registered in Londonderry, 64 resulted from the principal zymotic diseases—viz., 31 from scarlatina, 11 from whooping-cough, 7 from measles, 4 from fever, 2 from diphtheria, and 9 from diarrhœa. The rate represented by these deaths is 2·1 per 1,000 of the population.

With the exception of 28 deaths from fever in Waterford, the principal zymotic diseases caused but few deaths in Waterford, Galway, or Sligo during the year.

THE RIGHT OF MEDICAL OFFICERS TO TAKE LYMPH FROM VACCINATED CHILDREN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Malin, Feb. 3, 1877.

DEAR SIR,—It is generally acknowledged that arm-to-arm vaccination is the most satisfactory, but it seems the medical officer has no power to enforce it. Refusal by parents to allow lymph to be removed for vaccination purposes is very general in this district, and it seems from the following official communication that I have no remedy.

Yours truly,
J. W. GILMORE, M.D.

Local Government Board, Dublin,
January 20th, 1877.

SIR,—The Local Government Board for Ireland acknowledge the receipt of your letter of the 13th instant, and of its enclosures, and in reply to your inquiry respecting the prosecution by the Board of Guardians of Inishowen Union of a woman, named Connor, who, it appears, refused to permit you to take vaccine matter from the arm of her child, the Local Government Board desire to state that there is no legal enactment which enables a medical practitioner to insist upon taking lymph from a child brought to him for inspection after vaccination; but there is rarely much difficulty experienced in effecting the desired object by a little ordinary persuasion with the parent.

By order of the Board,
B. BANKS, Secretary.

To Dr. Gilmore, Inishowen Union.

MARYBOROUGH DISTRICT LUNATIC ASYLUM.

At a meeting of the board of governors of this Asylum, held on Wednesday last, the 7th inst., the Right Hon. the Earl of Rosse occupied the chair.

Having complimented the medical superintendent, Dr. Hatchell, on the condition and general management of the asylum, the governors unanimously increased his salary, as also the salaries of the clerk and storekeeper, and the male and female attendants, taking into consideration the arduous nature of the duties performed by them.

EXAMINATION OF LUNATICS IN BRIDEWELLS

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—A person, who resided in my dispensary district having been found a short distance from her own house under circumstances which created a suspicion that she was of unsound mind and intent on committing suicide, was arrested by the police and taken at once—without having been seen by any medical man—to the Bridewell in the adjoining town, which is situated about half a mile outside the boundary of this district, and two days after she had been taken to the Bridewell two of the borough magistrates called in the dispensary medical officer of the district in which the woman was then confined, and had her examined, and an order made out for her removal as a dangerous lunatic to the county asylum. Ought not the magistrates to have summoned me to examine the woman? I have had to go to the same town to examine similar cases without fee or reward before the present act came into force empowering the magistrates to grant remuneration for the examination of dangerous lunatics and surely it would only be fair to allow me to examine those who belong to my own district now that we are paid for doing so. Will you kindly inform me through the columns of your journal what steps, if any, should be taken in the above case?

I am, yours &c.,
M.D.

[The 15th section of the Medical Charities Act says:—It shall be the duty of any salaried medical officer of a dispensary district under this Act, or (if more than one), *then the nearest of such medical officers*, save in the case of his sickness or necessary absence, and then the other nearest of such medical officers, . . . to examine and certify under the statute in that behalf as to the case of any dangerous lunatic brought before a justice of the peace, *within his respective district*, when summoned by such justice so to do.

The 30th and 31st Vict., cap. 118, says also:—Whenever any person shall be brought before any two justices, and it shall be proved to their satisfaction that such person was discovered and apprehended under circumstances denoting a derangement of mind, and a purpose of committing some crime for which, if permitted, such person would be liable to be indicted, the said justices shall call to their assistance the medical officer, or, if there be more than one, the nearest available medical officer of the dispensary district *in which they shall be at the time*, and if there shall not be any such medical officer available, then the nearest medical officer of any neighbouring dispensary district, who shall examine such person, &c., &c.

By the preceding clause of the same Act it is provided that it shall not henceforth be lawful for two or more justices to commit to any gaol in Ireland any person proved to their satisfaction to be a dangerous lunatic or dangerous idiot.

It would seem that the magistrates did not commit the lunatic to the Bridewell, and not certify her as a lunatic till two days afterwards. From the use of the words "before a justice of the peace within his (the medical officer's) respective district," and also from the words "in which they shall be at the time," it seems evident that the question turns upon whether the justices' inspection of the lunatic took place at the Bridewell or within the district of our correspondent. If the former, then the justices were right in calling in the dispensary doctor nearest the Bridewell, and M.D. has no remedy.—ED. M. P. & C.]

ANTI-SUPERANNUATION ELECTIONEERING.

WE learn from the *Wexford People* that a deputation from the ratepayers of the electoral division of B idgetown, waited on Mr. Murphy, the guardian of the division, for the purpose of requesting him to give his vote against the motion for giving superannuation allowance to Dr. Furlong. The deputation stated that they had made a canvass of the ratepayers of the division, and they had found that about nine-tenths of the ratepayers were opposed to superannuation. They wished to assure him that they entertained the most kindly feelings towards Dr. Furlong, and that they were opposed to the motion purely on principle. They well knew, and indeed it had been proclaimed in the board room, that should this motion succeed it would be quickly followed by many others of a similar nature, and in a short time a most obnoxious and unbearable tax would be imposed on the ratepayers.

Mr. Murphy said he was very sorry that he could not comply with their request on this occasion. Had the wishes of the ratepayers been intimated to him at an earlier period, he would have been happy to comply with them, but after having conscientiously given his vote on two occasions for the motion, he could not now stultify himself by opposing it. He felt that he had always done his best for the interests of the ratepayers, and regretted this difference of opinion between him and them, particularly as he did not intend to contine as the representative of the division longer than next March.

WEEKLY REPORT OF HEALTH OF DUBLIN AND SUBURBS FOR WEEK ENDING FEB. 3, 1877.

Total registered deaths in Dublin and suburbs *	...	177
Ten years average of same week	...	202
Decrease of mortality below average	...	25
Ratio of deaths, suburb of Rathmines ...	21·9	per 1,000
„ „ „ Donnybrook†	28·1	„
„ „ „ Blackrock ...	14·4	„
„ „ „ Kingstown ...	8·4	„
„ „ Entire Dublin district ...	26·1	„
COMPARATIVE RATIOS—London	22·6	„
„ „ Glasgow... ...	25·1	„
„ „ Edinburgh ...	21 2	„

* District extends over 10,050 acres, and contains 314,66 persons.

† This district includes City of Dublin and Incurable Hospitals.

The number of deaths from zymotic diseases registered during the week is 30; average number in the corresponding week of the previous ten years 36·7. The deaths from these diseases returned last week include 2 from small-pox, 1 of which occurred in the Mater Misericordiæ Hospital, and the other in Cork Street Fever Hospital, the former being that of a man who was "not vaccinated," and the latter that of a woman who was returned as "vaccinated;" 8 from fever (3 typhus, 3 typhoid, and 2 simple continued fever), 6 from diarrhœa, 3 each from scarlet fever and measles, 2 from croup, &c.

Ten children died from convulsions.

Bronchitis proved fatal in 24 instances, pneumonia in 4, pleurisy in 1, and lung disease unspecified in 2.

Nine deaths were referred to heart disease, 4 to apoplexy, 7 to paralysis, 4 to brain disease unspecified, 3 to liver disease, and 2 each to Bright's disease and kidney disease unspecified. Phthisis caused 19 deaths, hydrocephalus 2, mesenteric disease 1, scrofula 1, and cancer 2.

Six accidental deaths were registered, viz., 5 from fractures and contusions, and 1 from burns.

Eight deaths from whooping-cough, 7 from measles, 4 from scarlatina, 3 from diarrhœa, 2 from fever, and 1 from diphtheria, were registered in Belfast during the week.

CICATRICES OF THE KIDNEYS.

AT a meeting of the Anatomical Society, reported in *Le Progrès Médical*, sept. 9th, 1876, p. 647, M. Ferrand presented two kidneys, the surface of which were furrowed by a quantity of depressions more or less marked. They were taken from a patient who had suffered from heart affection and emphysema, the immediate cause of death, at the age of 60, being pulmonary emphysema.

M. Ferrand requested an expression of opinion as to the nature of these depressions—whether they were due to abscess, embolisms, cysts, or if the case was one of simple lobulated kidney. The president, M. Charcot, was of opinion that they were traces of embolisms dating back some twenty-five to thirty years, and that they testified to the existence of an old attack of endocarditis, accompanied by vegetation growths, which affection of the heart had been happily cured.

SOME PRACTICAL REMARKS ON AURAL AFFECTIONS.

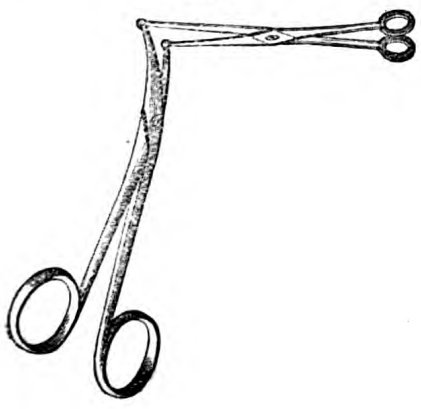
By H. Macnaughton Jones, M.D., M.Ch., F.R.C.S.I. and Edin.,

Surgeon to the Cork Ophthalmic and Aural Hospital, with Special Throat Department.

(*Continued from page* 124.)

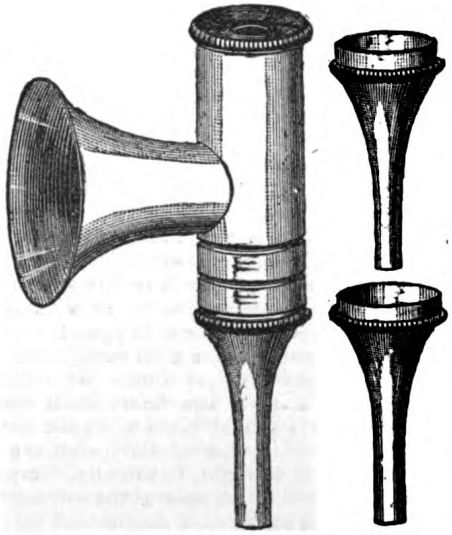
Examination continued (*auditory meatus*).—Having thus far ascertained the characteristic symptoms from which our patient suffers, the mode of their occurrence, and the nature of their progress, with such personal or family history as may be of importance, we next proceed to examine the present condition of the auditory passages. I shall here merely detail the steps which it is necessary to take, as it will be requisite to refer to each part specially in considering the various morbid conditions requiring treatment. The external meatus (excluding for the present affections of the auricle) is first to be examined. For this purpose we must have at hand a reflector, a few different sized specula, an ear syringe, and some cotton wool. It is well also to have means for cleansing thoroughly out the canal and removing any small portions of epidermis or cerumen or fungus which may remain after the syringing, and which would interfere with a full view of the meatus and membrane. I have been in the habit of using an iris hook with cotton wool rolled round the point for this purpose. It is also useful for touching the membrane with any solution in cases of ulceration or perforation, or in destroying the remains of polypi. Wilde's forceps, or the rectangular forceps used by Hinton (Fig. 1) may be required to detach adhesive epidermis or any small foreign bodies. The rectangular forceps will be found of the two the most useful; it is lighter, and the teeth being so perfectly adapted, the smallest particle may be grasped with it and withdrawn. It does not in the least interfere with the view of the meatus, and may be used through a wide speculum. We have now to place our patient in a good position for examination and to introduce the speculum. Whenever we can take advantage of it there can be no doubt that, as Hinton says, "ordinary daylight gives the most distinct illumination." A beautiful view of the membrane may be obtained by means of sunlight, but the light must be thrown rather on the wall of the meatus than directly on the membrane, as by its intensity it dazzles and prevents us seeing distinctly. It will be found most convenient to examine the patient standing, so as that he can be quickly moved in any direction. I generally get the person opposite to me and slightly between me and the light. A child is best examined standing on a chair, the head, if the child is restive, being fixed by the mother or some assistant. The mirror with the spectacle frame ordinarily used in laryngoscopy, with the ball-and-socket joint, will be found most useful, as with it we can either examine with the hand, or with the mirror on the face. With a little practice full illumination can be had from the face-mirror, and if there is any manipulation necessary it is the best method of using the mirror, as we have both hands free to carry such manipulation out. If we use artificial light, and employ the bull's-eye burner, with the universal bracket, to be had of any instrument maker, the

Fig. 1.



patient must be placed sitting, and with the light a little to the side of and behind him. Any one can, after a short time, familiarise himself with the steps necessary to make a complete examination by this method. For bedside purposes, and in houses where we are called to see patients at night, the most perfect lamp I know is that of Messrs. Weiss (a drawing of which I will furnish when describing the instruments necessary for diagnosis and treatment). It is in a small portable case, 3½ inches by 3¼, which contains a lamp and paraffine; the lamp, which, with a miniature bull's-eye burner, furnishes a beautiful clear light, can either be placed standing on a table, or held in the hand of an assistant. With it I have frequently made ophthalmoscopic and laryngoscopic examinations. It is, therefore, a most useful companion, in fact, almost an indispensable one, when we are summoned in a case of emergency to the country. We now proceed to introduce the speculum. Here we must remember the great timidity which many patients exhibit on being examined. Therefore it is that a light and gentle yet firm hand is required to conduct all aural manipulations. In many affections of the auricle and meatus there is superadded to the natural sensitiveness an inflammatory state which makes the handling of the ear a thing to be avoided as much as possible. Rough pulling of the auricle or any forcible pushing of the speculum is sure to be resisted by the patient, who may, perhaps, be alarmed at any further interference. But in any case of aural affection all force or roughness is to be deprecated. Those who cannot manipulate with gentleness had better not manipulate at all. A man's entire success with a patient will depend much on the confidence and ease with which he introduces the speculum or the Eustachian catheter. The infliction under any circumstances of unnecessary pain should be avoided. This preliminary can only be secured

Fig. 2.



Brunton's Auriscope.

by keeping constantly in mind, and strictly adhering to the resolution, to *avoid all force*. It is to the rigid carrying out of this principle that most men owe that delicacy of touch which comes from the constant treatment of all delicate and sensitive organs, such as the ear, eye, and urethra. No rough or awkward surgeon will ever make an aurist. Different varieties of specula have been brought into notice since the time when Grüber and Wilde first introduced theirs to the notice of the profession. For practical purposes either those known as Toynbee's (*vide* plate), or modifications of those, as Turner's, will be found quite sufficient, Some surgeons prefer specula with an opening at the side to facilitate examination of the meatus and for therapeutical purposes, or as recommended by Hinton, a speculum with a small piece out of the end in order that a more perfect view of the membrane may be obtained. I here figure some of the best known kinds of specula, and will only add that the utility of a speculum does not depend so much on its form or shape as on the hand that guides it. For childen it is necessary to have a speculum with a small, and, I prefer, a perfectly circular tubula end.

Specula.

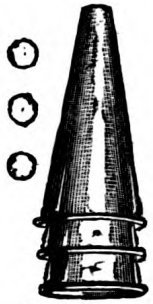
Fig. 5.

Toynbee's.

Fig. 6.



Politzer's.

As the first essential towards successfully introducing the speculum in the adult we must keep in mind the length and direction of the external auditory canal. The following description of Bernstein is so simple and clear that I venture to insert it here.

"Just as the eyelids prevent the entrance of any injurious substances into the eye, so the external ear prevents the entrance of dust and small particles, which might easily be blown through the air into the auditory canal, and to prevent the entrance of insects, not by a closing movement, but in the human ear, by means of its peculiarly coiled form, which makes the entrance difficult to find. The latter also, is more or less covered with minute hairs, which serve to catch any dust which penetrates without perceptibly deadening the sound.

"The auditory canal, the first part of which (⅓) is composed of cartilage, and the inner part (⅔) of bone, is not a straight tube of equal width. It is contracted at the opening, which contraction turns upwards and inwards; then it expands and terminates at the tympanic membrane, the surface of which is placed at an oblique angle to it, and is directed inwards and downwards. On the sides a fatty substance, the wax of the ear, is secreted by small glands, which is intended to keep the sides, and perhaps the tympanic membrane itself, in a supple condition, and to protect it from dryness."

"In introducing the speculum," says Hinton, "it must be remembered that (beginning from without) the meatus winds, first, a little forwards and then backwards, and

slightly upwards, so that there is a tendency for the eye to fall on the wall of the meatus, instead of reaching the membrane; and the speculum accordingly must be introduced well into the passage, and directed first a little forwards, for the most part with a slight pressure on the outer part of the posterior wall, to straighten the cartilaginous portion of the canal. This will be much aided by drawing the auricle slightly upwards and backwards with the left hand." We can reverse hands according to the ear examined and the position of the patient.

Tröltsch draws attention to the slow development of the osseous meatus in the child, stating that, "Often until the sixth year, a gap is left in the ossification, which only diminishes very gradually, and, from its sharp irregular edges, might very easily be considered morbid and the result of caries, and at any rate might facilitate the spread of inflammatory processes to the maxillary articulation and the parotid gland." And that "in very young children the inner half of the exceedingly narrow meatus has scarcely any open calibre, since the membrane, which lies horizontally, is in contact in its whole extent with the membranous floor of the meatus, this contact being due in part to the fact that the epidermis covering the membrane has at this time very considerable thickness."

Having introduced the speculum well into the meatus, we note its shape and size, if narrowed and painful; if the dermis is congested, or inflamed; if there is any discharge, and if so, its colour, nature, or smell; if there is a collection of cerumen which interferes with our view of the membrana tympani. If there is any pus or epithelium which blocks up the meatus, it must be carefully removed with the syringe, and the passage cleaned with a little cotton wool rolled on the iris hook. The canal can then be examined thoroughly for foreign bodies, polypi, molluscous or sebaceous tumours, fungi, exostoses, &c. We next examine the membrane. Here, without departing from my previously stated determination not to introduce any anatomical description, I must notice the points which it is requisite to keep in mind in making an examination. The healthy membrana tympani is translucent and concave. It is placed at an angle of 140°, and fixed to the temporal bone at its circumference, and by its centre to the handle of the malleus. At the point where the short process terminates, we notice the most concave portion of the membrane, and here we see the well-known triangular spot which gives to the membrane that beautiful and lustrous appearance when light is thrown on to it by the mirror. The bright spot is generally directed downwards, but its position and extent are variable, and it is by no means uncommon to find its usual shape altogether lost, or perhaps no bright spot in an ear in which the hearing power is perfectly normal. It serves as a delicate indication of the degree of mobility of the membrane as it is variously altered when the membrane is forcibly inflated. In a normal state this spot partially disappears on inflation, and the funnel-shaped depression underneath it is bulged outwards. The short process of the malleus is also of considerable importance in a diagnostic point of view, for it separates, as described by Trölstch, the anterior from the posterior pocket of the membrane, the posterior being over, the anterior under the short process. These pockets are formed by the ligamentous folds of mucous membrane or prolongations of the ligamentum mallei anterius. They are of clinical importance, as it is now recognised that here the secretion of mucus is retained (Hinton), and that they are the source of the bulgings of the membrane which we so frequently see when this retention occurs. We may now seek to satisfy ourselves on the followings points: (*a*) the appearance and position of the handle of the malleus, if drawn inwards and "shortened in perspective" (Tröltsch); if it appear unusually prominent or altogether displaced and dislocated from its natural position; if it is vascular with vessels on the surface, and presents a red appearance; (*b*) the triangular spot, if present, its direction and lustre; if the cone has lost its distinctive shape, or if there are two or more of these distinctive spots of light, (*c*) the general colour and appearance of the membrane itself; its degree of curvature, opacity, and thickening; the degree of mobility on inflation; the signs of any deposits, calcarious or otherwise; the presence of polypus; if there be pulsation, rupture, or perforation. We detect the patient's power to inflate the membrane by means of the otoscope. (Fig. 7). This simple contrivance also enables us to arrive at a conclusion as to the state of the Eustachian tube. The otoscope of Politzer is a simple india-rubber tube, having a small vulcanite ear-piece fixed at the end. Three tubes may be had connected to a central hollow vulcanite ball. This form is convenient, as the patient can place a tube in each ear, and the result of the inflation of the two membranes can be contrasted. It is also useful for teaching purposes, as a student can examine the ear with it at the same time as the surgeon. By placing a tube in either ear of the surgeon, the intensity with which the sound is conveyed is increased, and the least inflation perceived. Double German otoscopes, on the principle of the double stethoscope of Scott Alison, have been contrived and used by Lucae and Turnbull. Of these I have no experience.

OTOSCOPE MOUNTS FOR NOSE AND EAR DOUCHE.

(To be continued.)

PLASTIC OPERATIONS ON THE FACE. (*a*)

By Mr. J. K. BARTON, F.R.C.S.,
Surgeon to the Adelaide Hospital, Dublin; Lecturer in Surgery in the Ledwich School of Medicine.

DEFORMITIES of the face, arising from any cause, inflict such distress upon those who suffer from them, that the aid of the surgeon is never more earnestly sought for, in the hope that the defect—often felt to be a brand of disgrace—may be removed, or at least mitigated. There is a special pleasure in operating in such cases, inasmuch as, if successful, our handiwork is visible and highly appreciated. Many who have undertaken such operations have discovered that the difficulties in the way of success are numerous, and that frequently what appears (immediately after an operation) to promise complete success, presents afterwards, from subsequent contraction, anything but a gratifying result.

The following cases afford examples of some of the difficulties met with. The means I employed to combat them have been tolerably successful; but I have no doubt other plans of procedure might also be successfully followed, and that the whole subject of plastic operations on the face may be discussed with advantage.

CASE I.—*Deformity of Face from Cancrum-Oris.*—Annie A——, æt. 10, was admitted to the Adelaide Hospital in December, 1875. One year before admission she had scarlatina, which was followed by cancrum-oris, from which she recovered with the loss of a portion of the right cheek, which had sloughed. Upon examination I found that the portion of the cheek which had sloughed involved the angle of the mouth, and extended upwards

(*a*) Paper read before the Surgical Society of Ireland. The discussion will be found on page 146.

close to the ala of the nose. It must have been about the size of a five-shilling piece, as the space left, after contraction had completely ceased, was the size of a two-shilling piece. As seen in the accompanying photograph, the right angle of the mouth was drawn upwards to the opening, through which projected the right canine tooth. The tissue of the cheek was firmly adherent to the bone, near the upper and inner side of this opening, and was thin, smooth, and like a cicatrix. The object to be accomplished in this case (viz., to fill up the gap and make the mouth straight) was rendered difficult by the adhesion of the tissues to the bone, and also by the low vitality of the cicatricial tissue round the opening.

The first operation was performed on the 17th January, 1876. The projecting tooth was first extracted, then the edges of the opening were carefully refreshed, a sufficiently deep margin of raw surface; being left all round a semilunar flap was then cut from the cheek, one extremity (the upper) was cut free, while the other was attached at the angle of the mouth. This was then readily turned round into the gap, and secured there by six fishing-gut sutures. The space in the cheek was then closed by three stitches; the effect of this was to make a new angle of the mouth, opposite the other, and also to fill the gap in the cheek.

This flap failed to unite to the lowly vitalised tissue near the opening, and consequently the gap remained, but diminished in size, as the flap only sloughed at its extremity. The greater part (very healthy tissue) lived and filled up the outer part of the gap. The cut in the cheek quickly united.

Seeing that it was impossible to get healthy tissue in the neighbourhood of the gap to fill it with, I determined to take a healthy piece of skin from some other part, and once again to try the old operation of Tagliacozzi. I had a cap of strong diaper made, which had a sleeve attached to it, open on the inside, and fitted with straps and buckles, by which the arm could be firmly held up to the face. This diagram in Szymanouski's Handbook of Plastic Surgery explains the apparatus I employed.

The second operation was performed on the 23rd of February, when the edges of the opening had been again refreshed. A flap—nearly twice the size of the gap to be filled, and exactly the same shape—was cut from the skin on the inside of the right arm, and left attached by a broad pedicle; the arm being raised and kept in position, the sutures were inserted. Four were found sufficient. When all were inserted, then the flap was carefully drawn into its new berth, and secured by the tying of the sutures; the straps were then adjusted, a little cotton-wool only being placed over the flap. It fitted so well, and lay so easily in its new position, that success seemed almost secured. The cap and straps answered their purpose so well, that, although the child was restless, yet not the slightest disturbance of the relative positions of the arms and face took place. She was carefully watched day and night, and fully fed upon strong beef-tea, beaten eggs, &c. Upon the morning of the third day after the operation, I loosened the straps so far only, in the first instance, as to see the flap. It was seen lying perfectly in its place, filling up the gap. Its centre was of a healthy pink colour, but all round the edge where it lay in contact with the edges of the gap was a blue line of slough. No union whatever had taken place. Thus the operation had failed. Disappointed, I directed my attention to the gap with its newly cut edges, and determined to try grafting on them as soon as they showed a granulating surface. To produce this, they were dressed with the red precipitate ointment. In a few days, a remarkable contraction of the gap was observed to be going on. I grafted the raw surface once, but am not certain that the graft took; but steadily the contracting process went on, until the gap was closed, all to a hole which just admitted the end of a probe. This vigorous contraction, **I think, was** caused by the two operations, and stimulated by the application of the healthy flap of skin from the arm. The result was that the corner of the mouth was drawn up to the right ala of the nose.

A third operation (on the 15th of March) completed the case. It consisted in making an incision an inch in length through the right cheek, in a line, into the mouth. This incision was not carried through the mucous membrane, which was divided by a parallel incision half-an-inch higher up; so that when both incisions were completed, the mucous membrane formed a flap, attached to the lower lip, and capable, when brought over the cut surface and stitched to the skin, of forming a mucous surface for the new lower lip. The upper flap made by this incision was stitched to the upper lip, thus completing the closure of the gap: while the lower formed a continuation of the lower lip, as the interval between them a continuation of the mouth.

One photograph shows the appearance some time after her hair had been shaved for an obstinate impetigo. The other, six months after she had returned to the country.

Case 2.—Mr. —— called upon me in March, 1876, exhibiting his nose, the left ala of which had been, to a great extent, destroyed by syphilitic ulceration about eight years before the time of his visit. During this period he had had two relapses or returns of symptoms, but none so severe as the first, and for the past year he had been absolutely free from any symptom whatever. He found the appearance caused by the loss of the left ala detrimental to him in his business, and the object of his visit was to see if an operation could be performed to remedy this unsightly gap. The skin over the tip of the nose and for some distance round the gap in left ala was then shining and tense-looking; there was not the slightest syphilitic sign about him, and he appeared in excellent general health. A flap could readily be raised from the cheek and turned into the gap; the question was would it unite with the then almost cartilaginous edge of the opening? I determined to try, and so upon the 25th of March the preliminary operation was performed. A small narrow-bladed knife was used to refresh the edges of the gap, for by this means they could be bevelled, so as to give a much broader surface for attachment than would be given by cutting it horizontally. This was accomplished easily, the tissue proving sufficiently rigid to cut evenly, and thus a good wide surface was made for the flap to rest on and be secured to; a piece of thin leather was then cut exactly the size and shape of the gap thus enlarged, and this, when satisfactorily shaped, was placed on the cheek, round which the flap was then cut *one-third larger* than the pattern. The diagram shows the position of the flap to the surface it was destined to cover, and the pedicle which was left. This flap, when raised, was easily twisted round into the gap, where it fitted admirably; it was secured by six points of fishing-gut sutures; the gap in the cheek was then closed, and the edges held with three sutures; the nostril was stuffed very cautiously with an oiled plug of lint, while a little soft cotton wool was placed over the flap. The result was successful, the flap uniting all round, and the edge of the gap and the lower edge of the new piece forming an exact imitation of the opposite ala, which was straight and thin.

The incision in the cheek united at once, and in a week was scarcely discernible. An attack of rather severe erysipelas of the face, which came on in this case about a week after the operation, fortunately after the union of the flap was completed, caused serious apprehensions that it might give way, but it held firm. The special point of interest to me in this case was the proof it afforded that a plastic operation can be undertaken and accomplished successfully for the relief of the ravages of syphilis, the fears expressed by some, that in the syphilitic healthy union could not be obtained, proving groundless.

Case 3.—*Deformity from Burn.*—James Smith, æt about 24, was admitted to the Adelaide Hospital upon the 22nd of May, 1876, from Tanderagee. He had seen the little girl Annie A——, whose case has already been related, after she returned home, and he determined that he would come up and see if anything could be done fo

him. When about eight years old his clothes had caught fire, and the result was a burn of his neck and chest, the resulting cicatrix of which extended all across his back and upper part of sternum. The deformity produced by this contraction made him an object of horror to children, and disgust to most of his neighbours. The lower lip was completely everted, so that its edge was turned down and united to the skin a little above the sternum. Several consequences had followed from this eversion of the lip: in the first place, the saliva constantly flowed from his mouth, keeping his clothes in a constant sop; besides this, the growth of the lower jaw had been perverted—the horizontal ramus grew downwards or forwards too much, so as to render the approximation of the lower to the upper teeth impossible; in addition to this, the lower incisor teeth grew almost directly forwards, presenting a hideous *chevaux-de-frise* above the everted lip. The face had the drawn, expressionless appearance common in such cases, and the head was kept inclined to the right side. A photograph taken immediately after his admission shows these deformities very well.

The first step in the treatment of this case was to construct a stretching apparatus, by means of which the cicatrix could be constantly kept on the stretch. This consisted of a cap of strong diaper, which closely fitted his head; to this was attached two buckles at each temple. Into these buckles the end of a strong piece of flat india-rubber was passed, the loop being passed under the chin and everted lip. The cap at the back part ended in a short kind of tail, to which another buckle was attached, and to this another strong india-rubber band extended to the waist-band of his trowsers or drawers. When this cap and its attendant bands were fitted on, we had a double stretching: firstly, from the fixed points on either side the head, the elastic drew the lip up; and secondly, by the elastic behind, the whole head was drawn backward, and so the cicatrix below the lip was drawn upon.

The next step was to divide the most rigid and prominent part of the cicatrix by means of Skey's method of a number of small cuts. This gives partial relief, and as far as it goes is permanent.

Upon the 12th of July, the following more extensive operation was performed:—The patient being fully under the influence of chloroform, an incision was made through the sound skin immediately below the cicatrix, extending from one side to the other. The cicatrix was then disunited from its deep attachments, and allowed to be drawn up under the chin, thus leaving a raw surface across the lower half of the neck from one side to the other. A flap was now cut from the sound skin over the deltoid muscle on each side, of sufficient size, and of such a shape that when twisted roundto cover the entire raw surface, each flap uniting the other to the middle line, and by its lower border meeting the sound skin below, while by its upper border it touched the lower margin of the cicatrix. Fishing-gut sutures held these flaps nicely in position. There was no pull whatever upon their pedicles, which were about one inch in measurement across.

In a few days after this operation it became evident that part only of these flaps would live; they both partially sloughed, but a considerable part of each lived in its new position. A considerable raw surface extended across the neck, besides the raw surfaces at the shoulders. To master cicatrization, and at the same time to prevent as much as possible contraction from their grandulating surfaces, I had recourse to skin grafting, and in this I found a most material help. I grafted five or six points of skin every week for about six weeks; every single point without an exception, as far as I knew, grew, and the result was that the whole line of raw surface has soundly healed, with a wonderfully slight amount of contraction.

The lower lip, now freed from its adhesion to the neck, being drawn by its own weight—and although the saliva could be to some extent retained in the mouth, yet when eating it dribbled as usual—it was evident that his lower lip was too large, and would admit of curtailment with advantage; so a third operation was performed, which consisted in removing a V shaped piece of the lip, close to the right commissure, and uniting the cut surfaces, by harelip pins, by which means the lip was drawn across the lower jaw, and when all inflammation had subsided and the contraction was complete, he had complete relief from the escape of saliva. It became necessary then further to contract the lower lip by a supplementary operation shortly afterwards, by which the right commissure was thus further closed, and the case rendered more complete. The result is shown in the accompanying photographs.

Case 4.—Annie L——, æt. 22, came to me in the beginning of last October, and asked if a growth which she had on her nose could be safely removed, as it much interfered with her personal appearance. Upon examination I found a tumour, about the size of a good-sized nutmeg split in two, situated a little to the right of the extremity of the nose. It felt very firm, could not be emptied by pressure, nor did it seem to enlarge by coughing, sneezing, or other exertion; yet it had a vascular appearance, and as it was congenital, and had daily increased in size, I was induced to consider it nævoid in character. I found it would be impossible to cut any flap in the neighbourhood which could be turned in upon the raw surface left by the removal of this tumour, as the skin of the nose was much too thin and closely attached to admit of it. I therefore determined to excise the growth, and trust to grafting to cover the new surface with healthy skin.

Oct. 17.—The tumour was excised; it bled freely, and turned out to be a species of nævus. The oval raw surface was dressed for about a week, and then presenting a granulating appearance, three small skin grafts from the upper thin skin of the chest were put in; they grew, and in a very few days the whole was soundly healed, with very little mark, as will be seen by the plates.

CASE OF HYDATID OF LUNG.

By H. Talbot Higginson, M.D., Donaghadee.

On the 30th of November, 1874, I was called to see D— B—, aged 34, a small shopkeeper, who, it was said, was spitting up blood. He had been some years in Australia, and about three years ago first complained of pain in right side and noticed a swelling; had also a cough, and spit. The swelling had gradually increased, and was lanced about two years ago by a surgeon, when about a spoonful of clear fluid escaped at the time, and the wound healed up. At this time he had been spitting blood, which was somewhat relieved after the operation.

When seen he was coughing and spitting up a good quantity of thick bloody-looking spit, his appetite had been bad for some time, and he complained of a good deal of pain in his right side, where there was a swelling which could be felt about the size of a hen's egg, elastic to the touch, and feeling as if it contained fluid, protruding from between the seventh and eighth ribs. I examined his chest but could detect nothing unnatural but dulness in the neighbourhood of the tumour and the breathing quick. The tumour had no bruit or impulse. I ordered him the following mixture:—

℞ Quininæ disulphatis, gr. xx.;
Acid sulph. dil., ℥j.;
Tr. opii camph., ℥j.;
Syr. tolutani, ℥j.;
Aquæ ad., ℥viiij.

℥ss ter in die,

and the tumour to be painted over with tr. of iodine, as I thought to get it to adhere to the side before opening it.

On the 2nd of December I was called to see him at five o'clock, a.m., as he was then bringing up a large quantity of blood. I then determined to open the tumour so as to relieve the lung from pressure, which I did by inserting into it a medium-sized trochar and canula, and in with-

drawing the trochar I was surprised to find no sudden escape of matter, but gradually a very thick yellowish matter made its appearance, and only a drop or so fell from the canula, even when a probe was passed down to see if it was free. From the history of the case, and from nothing but clear fluid in small quantity having come away when lanced two years before, the long time it had been there, together with the small quantity of matter from such a large lump coming away now, I diagnosed it as a case of hydatids of the lung, which circumstances afterwards proved correct. As the matter was so thick I determined to leave the canula in, and covered it over with a linseed-meal poultice. In the evening, when changing the poultice, the canula slipped out, and about an ounce of matter had come away. As he felt much easier and was very sleepy I did not wish to disturb him by trying to reintroduce the canula, so ordered the poultice to be renewed and left him for the night. Next morning, the 3rd of December, I was called to see him, as he was in a very nervous way and slightly delirious, and I ordered him :—

℞ Chloral hydratis, gr. xxx. ;
Syr. tolutani, ℥ss. ;
Tr. cardamoni co., ℥ij ;
Aquæ, ℥j. M.

to be taken immediately, and the poultice to be continued. In the evening he was better and felt easier as he had had a good sleep, but very little matter had come away. Next day, 4th of December, as he was complaining of cough and little matter coming away, I again introduced the trochar and canula, which brought away a very little matter. I tried to draw it out with a breast-exhauster, but there would not any come. I then introduced a small flexible catheter through the canula, and with a temporaty aspirator tried to draw off anything that might be in the gathering, but nothing would come. I then left the canula in and kept it there for two days, when I removed it, as there was nothing now coming away, and ordered a poultice to be kept on over the opening, and he was to continue taking the quinine mixture. He continued improving in health and the spit was not so bad, but the lump was much the same, and very little discharge coming from the opening up to the 5th of January, 1875, when I was called to see him, as there was something like skin had been coming out of the hole ; when I saw him there was a piece of something like boiled macaroni, about two inches long, sticking out of the hole, which would have admitted the tip of my little finger. I ordered the poultice to be kept on, and next day, when I called, was told that the evening before a quantity of stuff had come away with a gush, like pieces of skin and bunches of grapes, which had filled two bowls full. Unfortunately I did not see them, as they had been thrown out. There was then very little discharge, and the lump in the side had greatly diminished in size. As he felt rather uneasy, I gave him pulv, doveri, gr. x., at bedtime ; next morning he felt easier, but he had a good deal of bloody spit and there was considerable hardness over the side. The breathing could be heard over a larger space around the lump. A slight discharge and bloody spit continued up to March, when the side ceased discharging and commenced to swell again with a considerable amount of pain, so that I found it necessary to give him small doses of chloral to obtain ease.

On the 8th of March I reopened the wound by passing a probe through the hole in the side, when a quantity of water came away having a very fætid smell, and afterwards a quantity of membranous stuff like wet parchment ; next day he felt much easier, but the spit was very bad, thick, and corrupted-looking ; the swelling in the side had gone down greatly. On the 10th of March there was a good amount of water and blood came away from the side and he felt very weak, could not sit up, but lay on his back. On the 27th of March he commenced to expectorate small hydatids now and again, mixed with the spit. He was confined to bed until May, when, with the aid of tonics and expectorants he was able to get about again, but his right lung was greatly disorganised, and he still had a very bad spit, which was sometimes better and sometimes worse, but the wound in the side had healed up.

In March, 1876, he had a very bad attack of diarrhœa, which weakened him greatly and he was again confined to bed, and was unable to be moved off his back, as the moment he raised his head he felt as if he would suffocate, and he spat up a quantity of thick mattery stuff, but no hydatids. Nothing seemed to relieve him but small doses of sulphuric ether, which he took when he felt his breathing bad. This continued up to May, when he gradually again got better, and with tonics, &c., was able to go about, and since then up to the present time (January, 1877) he has been attending to his business, but in a delicate state of health, and still has a spit which is now and again worse at times. The lump has disappeared.

Clinical Records.

NORTHERN HOSPITAL, LIVERPOOL.

Case of Emphysema, with Remarks.

By James Barr, M.B., L.R.C.S. Edin.,
Late House Surgeon to the Northern Hospital, Liverpool.

Case of Pericarditis—Pleurisy—Bronchitis—very extensive Emphysema of the Lungs. The "rale crepitant sec a grosses bulles," with tactile fremitus.—Death—Autopsy.

J. H., æt. 34, seaman ; admitted under the care of Dr. Dickinson, October 22nd, 1874, with urgent chest symptoms.

His recollection of the commencement of his illness is somewhat vague, but he states that it first began about eighteen months ago, though previous to that he had occasionally been troubled with cough, when in Java, where he seems to have led a very intemperate life. On his way home he was laid up for three months at Port Said, with "weakness and feverishness." He was jaundiced, and his skin did not clear until about twelve months ago, when the present chest symptoms began. He had chancre and suppurating bubo seven or eight years ago, but never had rheumatism.

General condition.—He is anæmic, and much emaciated; his skin is rather yellow, and conjunctivæ bile-tinged ; tongue furred, appetite bad, bowels regular ; cough troublesome, expectoration very abundant and muco-purulent ; pulse 90, very weak ; respirations 30.

Physical examination.—The chest is distinctly barrel-shaped, and the extraordinary muscles of respiration are called into play. There is scarcely a part of the lungs free from mischief of some description. Bronchitic râles, both moist and dry, seem to be almost universally present, and those of the latter character are very intense and snoring over the right lung. At the apices the percussion is dull, there are numerous coarse crepitant rales, inspiration is much diminished in volume, and expiration is relatively prolonged. Over the rest of the lungs the vesicular murmur is very defective, and the percussion note is clear except at the bases where there is evidence of slight effusion into both pleuræ. Over the greater part of the right lung, but most markedly at its base and over the lower lobe of left lung, are heard very peculiar double shuffling rales, having a loud coarse crepitant quality—the *rale crépitant sec a grosses bulles* of Lænnec. The *frottement ascendant* possesses these characteristics in a more marked degree than the *frottement descendant.* When the hand is applied to the chest over the sites of these peculiar rales, the shuffling is distinctly perceptible to the tactile sensation.

The heart's apex is situated in the 5th interspace and in the line of nipple, transverse cardiac dulness measures five inches. The sounds are dull and obscure. Over the whole cardiac area there is heard, especially when the pa-

tient is lying back, a fine, shuffling, double friction murmur which is deficient in its relation to the cardiac rhythm.

Hepatic dulness, which is much depressed, measures 4 inches in line of nipple and 4½ inches in line of axilla. The splenic dulness measures 4 by 3 inches. The urine is non-albuminous.

Dry cupping gave considerable relief, but this and other treatment had only palliative effects. The patient expired on October 31st.

At the *autopsy*, 11 hours after death, both pleuræ were found to contain a considerable quantity of fluid, and the parietal layer of the left was adherent to the pericardium. The parietal and visceral layers of each were joined by a few long fibrous bands, but so loosely that the movements of the lungs would be scarcely, if at all, restricted. On removing the lungs they presented a rare and peculiar appearance, viz., on looking at their external surface they seemed as if they were composed of very numerous irregularly sized and shaped lobules, each separated from those adjacent by deep fissures. In the depth of these interstices were firm constricting bands of organised lymph, binding and puckering the lungs together at points, and allowing it to expand between the adhesions into the emphysematous lobules of which the external surfaces of both lungs were composed. Throughout the lungs, but more especially at the apices, were scattered hard, gritty, and caseous deposits, the latter in a state of softening. There was considerable œdema, and the bronchial tubes contained a great quantity of frothy mucus.

The pericardium was very much thickened, and deeply coated on both layers with coarse honey-combed lymph, of which, some on its anterior surface was finer and of recent date, while all that on the posterior aspect was extremely rough and thick. The two surfaces were non-adherent, and the cavity contained five ounces of fluid. The heart was large, but the cavities were not opened as it was retained as a specimen of severe pericarditis.

The liver was of normal size, and showed a great amount of red atrophy which was much more marked at some points than at others. Spleen normal. Kidneys congested, but structure otherwise healthy. Stomach slightly thickened at the pyloric end, and that orifice was rather narrow.

Remarks.—The autopsy in this case revealed abundant evidence of old pleurisy and pericarditis; but it would be difficult or impossible to infer from the pathological conditions, which was the primary affection, or whether they were coeval in their origin, and due to the same cause: and the indefinite history which we get from the patient does not help us to solve the problem.

As to the severity of the inflammation, if we be guided by the amount of lymph we must at once conclude that the pericarditis was the most intense; but as to the resulting consequences we have sufficient proof in the extreme emphysema that the pleurisy led to the greatest interference with vital function. Both layers of the pericardium were affected, and deeply covered with coarse fibrinous lymph, which had undergone very little organisation; whereas almost only the visceral layers of the pleuræ had been affected, and covered with a thin layer of lymph, but which must have been of a highly organisable nature as shown by its binding and puckering the lung at numerous points. In short, the pleuritic lymph would seem to have been of that gelatiniform or corpuscular character (similar to that which occurred in a case of pericarditis which I recorded in this Journal, of Jan. 24), which is highly organisable; whereas the pericarditic lymph was very fibrinous, indicative of severe inflammation, and also of low organisation.

The calcareous and caseous deposits which were scattered throughout the lungs had, no doubt, their origin in the frequent catarrhs from which the patient suffered. My esteemed teacher, Professor Gairdner says, (*a*) "I have likewise to include, as a consequence of bronchitis, the pulmonary concretions which are frequently found in the midst of atrophied and indurated portions of pulmonary tissue. . . . . It is well known that the tendency of modern opinion has been to follow Lænnec, in considering these bodies as the result of cured tubercle—a view of their origin which, though undoubtedly correct in many cases, I am inclined to regard as too exclusive, and as therefore requiring modification."

The production of the emphysema in such an extreme degree is very easily explained on Professor Gairdner's theory. He says, (*a*) "I am prepared to maintain that emphysema of the lung may, in all cases which I have witnessed, be satisfactorily accounted for by considering it as *a secondary mechanical lesion, dependent on some condition of the respiratory apparatus leading to partially diminished bulk of the pulmonary tissue, and consequently disturbing the balance of air in inspiration.*"

According, therefore, to this eminent authority, emphysema can only occur when there has been previous reduction in the volume of the pulmonary tissue. It is a mechanical lesion, due to the ordinary inspiratory force, expanding the healthy lung tissue not merely to its wonted limit, but so as to make up the deficit caused by the previous collapse, from whatever cause arising. It is not a compensatory lesion, but a complementary lesion, to enable the lung tissue, which has been previously reduced in volume, to fill the thoracic cavity.

To again quote from the same author (*b*)

"It cannot be produced, in health, by *any* amount of inspiratory violence, because the lung admits of being readily and easily expanded, without straining any of its air-cells, to the full volume permitted by the expansion of the thoracic walls. It cannot even be produced in disease, except when the volume of lung is directly diminished in relation to the space which it has to fill in inspiration. Emphysema, therefore, is never found in connection merely with pleuritic effusion, or with hepatisation, or with tubercle."

In the case which I have recorded, the pleurisy in the first instance would not reduce the volume of the thoracic contents, but when the effused fluid became absorbed, and the lymph, which played the part of contracting cicatrices, on the visceral surfaces, became organised, then the long tissue was hampered from filling the thoracic cavity during inspiration. But the thorax must be filled somehow, during inspiration, as a vacuum cannot exist, except under conditions which are able to counteract the atmospheric pressure—a power of resistance which air-cells do not possess—therefore, the cells near the surface, which were subjected to the greatest strain, became expanded and fused together, so forming the emphysematous blebs or lobules of which the superficies of both lungs was composed, and thus the thorax was filled. As contributory links in the causation of this extreme degree of emphysema, may be mentioned, the collapse, atrophy, and pulmonary concretions, consequent on attacks of bronchitis.

There were some physical signs present in this case in a most marked degree. I allude to the peculiar frictional phenomena, audible to the ear (as the "*râle crépitant sec a grosses bulles*" of Lænnec), and perceptible to the touch, which have not been sufficiently recognised by many writers on emphysema, though they did not escape the observation of Lænnec, and are clearly described by Dr. Gairdner (*c*). This peculiar *râle* in this case was quite unique in occurring over such an extent of surface, and in being so intense in character. It was very coarse and shuffling, both in inspiration and expiration, and might easily have been mistaken for the frictional râle arising from the rubbing of surfaces coated with rough lymph, but then its peculiar crackling quality, and the presence of other signs of emphysema, enabled me to decide that it was at least in part the distinctive râle of emphysema.

(*a*) *Edin. Monthly Journal of Med. Science.* May, 1851. Page 447.

(*a*) *Ibid.* July, 1851. Page 15.
(*b*) *Brit. & For. Med. Chirurg. Review.* April 1853. P. 472.
(*c*) "Clinical Medicine." P. 443-53.

It was impossible to say what part pleuritic lymph had in its production until the *post-mortem* revealed the absence of that cause of sound.

This peculiar crackling, rubbing sound is usually present in a more or less marked degree in emphysema, according to the extent of the lesion and the freedom of the lung movement. In slight cases it can be heard along the sides of the sternum, as a short *brush* at the end of inspiration; while in more severe cases it may extend over a greater area, and be heard as a *creaking* sound, not only during the greater part of inspiration but also in expiration. It is only where there is considerable distension of the emphysematous lobules and free lung play, that the *frottement* is perceptible to the touch.

Transactions of Societies.

SURGICAL SOCIETY OF IRELAND.

A MEETING of this Society was held on Friday, Feb. 2, 1877, the Vice-President of the College, Dr. ROBERT MCDONNELL, in the Chair.

VESICAL CALCULUS.

Mr. RAWDON MACNAMARA said, that on last Wednesday week he removed a calculus from the bladder of a child aged 4 years. There was nothing extraordinary in such an operation, but taking the age of the patient and the size of the stone, it appeared to him something very remarkable. He begged now to lay before the Society the stone, which weighed exactly ¼ oz., and the length of which, in its longest diameter, was 1 inch. The width of the stone—and he had most carefully measured it—was 6-8ths of an inch, and the breadth ½ an inch. As far as his experience went, a calculus of that size was unusually rare at such an early period of existence. He might mention that the calculus was removed by the lateral operation, and it was very striking, indeed, the facility with which the stone was extracted contrasted with its size. The patient was now nearly well.

EPITHELIOMATOUS ULCER OF LEG.

Mr. COPPINGER exhibited a very typical specimen of epithelial ulcer of the leg. He removed the limb by one of the ordinary method—by a combination of the flap and circular amputation. The growth had been recognised as malignant for eight years, and it was removed from a woman 65 years of age. He had made a section of the ulcer and it presented the ordinary appearances of epithelioma. It did not form on a cicatrix, but had its origin in a wart.

Dr. BARTON read a paper

ON PLASTIC OPERATIONS ON THE FACE,

which will be found on page 141.

SPILOUS NÆVUS.

Mr. B. WILLS RICHARDSON exhibited under the microscope a section of the nævus to which Dr. Barton alluded. The section had been cut by Dr. Rainsford while his (Mr. Richardson's) microtome was undergoing alterations; but he (Mr. Richardson) subsequently stained and mounted it. The nævus was a typical example of mole or spilous nævus, and was chiefly composed of an overgrowth of hair, a multiplication of sebaceous glands, and some connective tissue. The overgrowth of hair was considered an essential of that form of mole, and, according to Rindfleisch, a multiplication of the sebaceous glands was so rare he had seen it only once. Now, in the section exhibited by him (Mr. Richardson) there was an excessive multiplication of those glands as well as of hairs, the stroma being, relatively speaking, small. So remarkable was the overgrowth of hairs in the tumour that some of the follicles contained several hairs; indeed, in one of the follicles of the section under the microscope, eight hairs could be easily counted.

PHARMACEUTICAL SOCIETY OF IRELAND.

MEMBERS' EVENING MEETING.

THE First Evening Meeting of the Society was held on Thursday, February 8th, at the King and Queen's College of Physicians. The chair was taken at 8 o'clock by Dr. AQUILLA SMITH, Vice-President of the Society. There were twenty-seven members present.

The CHAIRMAN, in an introductory speech, made some complimentary remarks in connection with the name of the chief representative of pharmacy in this country during the previous generation. This bright example of an apothecary who had devoted his life to the study of pharmaceutical chemistry had only just passed away from us. He referred to Michael Donovan, of Dublin. The Chairman, in the course of his speech, suggested two important questions for solution to the members of the Society: 1st. A good method was required for dissolving salicylic acid (say, even 10 grains to the ounce) without interfering with its chemical reactions. 2nd. A good formula for an aconite plaster.

Mr. DRAPER was then called on to read his paper on

THE SOLUBILITY OF ETHER IN AQUEOUS HYDROCHLORIC ACID.

A discussion having followed this paper,

Dr. WALTER SMITH read a paper on

A SPECIMEN OF A NEW VARIETY OF PALE CATECHU.

This drug, which was now in the London market, differed very much in appearance from the catechu pallidum of the Pharmacopœia. It was in light coloured small rectangular pieces, about half-an-inch long by a quarter of an inch in thickness. It was perfectly free from starch, the usual adulterant, but was inferior as regards the amount of catechu—tannic acid. The following represents its composition:—

	Catechu Pallidum. B. P.	New variety.
Moisture	13·9 ...	6·2
Insoluble portion ...	10·6 ...	59·4
Tannin	25·9 ...	9·7

Dr. TICHBORNE then read his paper on

SALICYLATE OF ATROPIA AND ITS APPLICATION TO PHARMACY.

It is well known how difficult it is sometimes in the most simple preparations to get such an article as shall meet all the requirements of the physician, the surgeon, and the pharmaceutist. Thus, while a particular preparation may just hit off the views of the prescriber, it may be devoid of keeping properties—a point of considerable importance in these days when the dispenser has neither the inclination or time to make his own preparations. A striking instance of this clashing of requirements is to be observed in the solutions of atropia contained in the British Pharmacopœia. There are two of them both of the same strength (viz., 4 grains to the fluid ounce), as they are intended for the same use in ophthalmic surgery. The first (liquor atropiæ) is a solution of the alkaloid itself in a mixture of spirit and water; the proportions being 1-8th rectified spirit to 7-8ths water. Such a solution keeps fairly, but produces great irritation of the eye, particularly in those cases where operations have been performed, or where a chronic sensibility attending many abnormal conditions of the orgar. The liquor atropiæ is, therefore, inadmissible in such cases. We presume it is from this point of view that the rather absurd plan of introducing a second solution corresponding in almost all its therapeutical effects to the first is introduced. This solution is the liquor atropiæ sulphatis, which, although free from the objection of its being irritating, has another one equally objectionable, for it will not keep. A fungus is developed at the expense of the alkaloid, the solution becomes thick and muddy and looses strength. Perhaps the best remedy hitherto proposed was one suggested in Dr. W. Smith's book, but from some cause or other not generally adopted. The suggestion was, that the solution should be made with camphor-water. In conducting some experiments some years ago on salicylic acid, it struck me at the time that the salicylates of some of the alkaloids might be used with a considerable amount of advantage, as they ought to possess inherent antiseptic properties. I therefore considered that salicylate of atropia would be an appropriate salt to operate upon if such a salt could be formed. If atropia is mixed with salicylic acid in equivalent proportions a soft soluble mass is obtained that cannot well be crystallised, although accidentally a semi-crystalline mass was once obtained by acting upon a sample of foreign atropia. These results could never be repeated; it is probable that the crystallisation was due to the presence of some impurity. My experiments were afterwards

made with a beautiful crystalline specimen made by Messrs. Hopkin and Williams, of London. Atropia and salicylic acid were mixed in equivalent proportions, assuming that the last-named acid was a mono-basic acid, and that the alkaloid acted as a monad. If atropia be warmed with an excess of salicylic acid and a moderate quantity of water and then allowed to cool the excess of acid crystallises out, and on evaporating down the mother liquor 2·7 parts of atropia were found to give 4·04 of colloidal salicylate of atropia, which is ·05 over the weight required by theory. We are, therefore, justified in considering salicylate of atropia as having the following composition :—

$$C_{17}\ H_{23}\ NO_3\ C_7\ H_6\ O_3$$

If the atropia and salicylic acid be mixed in equivalent proportions and water added both the substances dissolve after some time, although the ingredients are both comparatively insoluble in cold water. The proportions used were—atropia 270 grs., salicylic acid 130 grs. If the aqueous solution be evaporated a colloidal mass will be obtained difficult to powder. An attempt was made to crystallise the salt from ether, but without success. Alcohol was also tried with a like result. This difficulty, as regards crystallisation, is characteristic of the atropia salts. The actual solubility of this salt was determined at a temperature of 15° C. In two determinations it gave, as regards saturated solutions,—

1st determination, 4·75 per cent. salt.
2nd ,, 4·69 ,, ,,

Therefore, if we call this 4·7 per cent. and as $\frac{95.3}{4.7} = 20{\cdot}2$, we may say that, practically, salicylate of atropia is soluble in 20 parts of cold water. Therefore, it is evident that it is easy to prepare a solution of salicylate of atropia which shall represent the solutions of atropia of the Pharmacopœia by dissolving atropia and salicylic acid in the following proportions :—

Atropia	2·7 grains.
Salicylic Acid (crystallised) ...	1·3 ,,
Water	1 ounce

Mix and allow it to stand until it is dissolved. With care, however, the salicylate of atropia may be obtained in the solid form, and then resembles the sulphate in appearance In the proportions given above the acid is slightly in excess of that required by theory. It is found desirable to have a slightly acidulated solution, or under any circumstances not an alkaline one, because a salicylate does not act as an antiseptic in the presence of an excess of alkaloid, or, what may be called, an alkaline solution. A solution made in the proportions given above will keep for an indefinite time. I have placed on the table for exhibition a sample of the salicylate of atropia, 4 grains to the ounce. The date when it was made was the 4th August, 1876, so that it is now over six months old, and it will be seen that there is not the slightest sign of any fungoid growth. As regards the possibility of its producing irritating effects, I placed some of this solution in the hands of friends who are in the foremost ranks as regards ophthalmic surgery. They have, with their usual courtesy, tried this preparation. I append some of their opinions so far as they bear on the keeping and non-irritating properties of the solution :—

Dr. A. Jacob writes :—When I received your salicylate I placed it side by side with a sulphate solution in my case of collyria, and I have used them comparatively in a great number of cases. I find now that, though exposed to the air, it contains none of the fungoid growth common to all atropine solutions, and serves its purpose as a mydriatic as satisfactorily as the first day, having lost none of its effect. It is—unlike the Pharmacopœial liquor atropiæ—quite unirritating, because, as I presume, it contains none of the spirit which is put into the liquor atropiæ to preserve it. I have found your salicylate a much pleasanter preparation for daily use, and in cases in which daily dilatation of pupil has been necessary, I have not found it to produce the conjunctival irritation which prevents in some cases the unlimited use of the ordinary solution.

Dr. C. E. Eitzgerald writes :—I have employed it in the treatment of several inflammatory affections of the eyes—iritis, ophthalmia, ulcers of the cornea, &c. Its mydriatic action is perfect, and its does not prcduce any smarting or irritation. I kept some of it for a month before using it, yet, at the end of that period, there was not a trace of the fungoid growth generally met with in solutions of this drug. I consider it a most valuable preparation.

Dr. Swanzy writes :—In reply to your inquiries respecting the salicylate of atropia, I can say that the specimen which you sent me has kept perfectly, although it is now more than nine months old no growth has formed in it. With regard to its non-irritating properties, I can as yet give you no opinion, a very long experience with the preparation would be necessary before coming to a conclusion on this point.

REGISTERED FOR TRANSMISSION ABROAD.

THE
MEDICAL PRESS AND CIRCULAR
is published every Wednesday morning. Price 5d. Post free, 5½d.

POST FREE TO ANNUAL SUBSCRIBERS £1 2 6
,, IF PAID IN ADVANCE 1 1 0

*** Post-office Orders and Cheques to be drawn in favour of—
A. A. TINDALL, 20 King William Street, Strand, London, W.C.
A. H. JACOB, 23 Ely Place, Dublin.
MACLACHLAN and STEWART, South Bridge, Edinburgh.

SUBSCRIPTIONS FOR FRANCE are received by Messrs. BAILLIERE, Rue Hautefeuille, Paris—post free in advance, £1 5s. per annum.

SUBSCRIPTIONS FOR THE UNITED STATES are received in New York, by Messrs. WILLMER and ROGERS; Baltimore, by Messrs. KELLY and PIET; Philadelphia, at the *Medical and Surgical Reporter* Office, post free in advance, £1 5s., about six and a-half dollars; or direct from the Offices in this country for the same amount, by International Post-office Order.

The Medical Press and Circular.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, FEBRUARY 21, 1877.

THE HUNTERIAN ORATION.

THE occasion on which the annual Hunterian oration was delivered last week was one of more than usual interest, both on account of the eminence and great reputation of the orator, and of the august visitors who honoured him with their presence. When it became known that Sir James Paget was to deliver the address, many were the members of the profession who looked forward to the oration as a great intellectual treat; while to add to the importance and dignity of the event, H.R.H. the Prince of Wales sat on the right of the President of the College, supported by the Dukes of Argyll and Westminster, the Dean of Westminster, Mr. Gladstone, and many distinguished members of the learned professions.

It is a characteristic but unavoidable feature of these annual orations, that they contain allusions which have been oft repeated, and that the orator finds himself under the necessity of going over well-trodden ground. Our object, therefore, in this article will be chiefly to draw attention to the many fine passages and many original observations with which this excellent address abounds, and to show what a keen and philosophical view Sir James Paget has taken of the character and genius of Hunter.

In speaking of the motives of John Hunter in his scientific life, Sir James Paget observed how in mere idleness or of necessity, with no other reason than that there was nothing else to be done, Hunter "drifted into the

opportunity of scientific study, drifted into the career in which he was to become great among the greatest men of science, and amongst all the surgeons of all times the most renowned." To pass from the idleness of a Scotch farm into the activity of life such as Hunter found surrounding his brother William was like being born into a new world, and this was the very world, if not the only world, in which the best parts of his mind could live and grow; for he had a natural fitness for the study of living things. For other things he seems to have had no greater desire or capacity of knowledge than ordinary men have. But this natural fitness was, in the first instance, wholly intellectual; there was no love or desire in it, and so the mind had no motive power until it was set to its right work, and in work found happiness. For the happiness of intellect is in its work; that of the highest intellect in vigorous self-guided work. The highest intellects find a happiness, the desire of which is their energising motive, not in the reception, nor in the mere possession, of knowledge, but in the process of acquiring it and of using it in thoughtful exercise. Gradually the desire for knowledge began to be an insatiable passion—a motive to incessant work; but with that passion another coincided. Hunter had a passion for collecting, and it cannot be maintained that this passion was only secondary to his desire of knowledge. Science gave it its first and chief direction, and his great ambition was to have a grand museum, richly illustrated with catalogues and drawings. Even if he could have collected everything that could show every fact in biology to be found, his love of collecting would not then have been satisfied. He collected a crowd of things besides—pictures of considerable cost, engravings, works of art in ivory, bronze, and marble, and implements of savage warfare. But he was withal an ardent lover of nature, and his love was almost wholly intellectual. He had none of that love which moves the poet, or the idealist, or theologian; for, in truth, neither poetry, nor theology, nor idealism ever coloured the simplicity of his scientific mind. He had the social love of nature, and he writes and speaks of the animals around him as if they were his companions. But his chief love was for the charms of truth that lie hidden beneath the veils and appearances of nature; and his love for them was continually increased when every search revealed the utility of all he saw, the perfection of adjustment of everything to its purpose, the fitness and design in every change, and the evidence of a grandeur in a world of infinite variety of form held steadfast by few laws.

"All these were motives to fresh study, and I cannot doubt," says the orator, "that he attained to that great achievement and satisfaction of the intellect when it can rest in a loving contemplation of the truth, loving it not only because it is just, but because it is beautiful. I cannot doubt that there is given to some high intellects, in view of a great field of scientific truth, a source of as pure delight as are the sensuous beauties to a cultivated artist-mind, or virtue to an enlightened conscience. Hunter had a pure, calm happiness in such contemplation. So Reynolds, his friend, seems to tell of him; for in that masterpiece of portraiture which teaches like a chapter of biography, Hunter is not shown as the busy anatomist or experimenter searching for objective facts; the records of his own works are all in the background, and he is at rest, and looking out, but as one who is looking far beyond and away from things visible into a world of truth and law which can only be intellectually discovered. In the calm vision of that world was his reward, and it may be the reward of all who will lead a scientific life with the same devotion and sincerity."

In passing on to the characteristics of his work and of his method, Sir James Paget alludes to those facts with which the profession are pretty well acquainted—to Hunter's great capacity for hard work, his early rising, the little time he allowed for sleep, his innumerable dissections, his patient and laborious observations on the development of young birds in eggs, the wide range of his studies, his pre-eminence as a pathologist as well as a comparative anatomist and physiologist, the thoroughness and originality of his work, the severity and scientific character of his mere amusements.

"In all these characters of Hunter's works we see that which was the dominant character of his mind; massiveness and grandeur of design were indicated in all to which he applied himself. And in perfect harmony with this was the simplicity of his ordinary method of work. It consisted mainly in the accumulation of facts from every source, of every kind, and building them up in the simplest inductions."

Moreover, nothing is more remarkable in him than his great accuracy as an observer of nature, the extreme caution with which he drew his inferences, and his freedom from dogmatism. A fact he tells without conditions; when he generalises, it is with "I suspect," "I believe," "I am disposed to think," or the like, and there cannot be found one instance in which he endeavoured to add to the force of evidence by any strong assertion of his own opinion, as if his opinion could be taken for weight in a balance of testimony. No one seems to have known better than he did that strong convictions are not usually the sign of knowledge. He seems to have thought he had never reached further than the nearest approach to truth which was in the time attainable, and that a year or more of investigation still continued would bring him nearer to the truth, and then that which now seemed right would be surpassed or set aside.

Another instance of this singular caution was, in the slowness with which he published anything. He was at work eighteen years before he published anything in his own name. He was forty-three when he published his first work, that on the Teeth, and for his great work on the Blood and Inflammation he may be said to have begun collecting materials when he was a student. The genius of Hunter was shown greatly in his devotion to experiment; and if there was one kind of truths which he preferred above all others, they were those which he could thus obtain. And yet when he came beyond the reach of observation or experiment, there were few who were so bold in thinking as Hunter was; and I believe that his long experience in the art of experiment justified him in this by training and educating his mind for yet further enterprises; for a well-devised experiment, such as many of Hunter's were, deserves the name of projecting, in that the mind, drawing itself forwards in advance of facts already ascertained, discerns that the truth must be in one or two or a few more probabilities, and then devises means for deciding where it is.

Hunter seems to have possessed the power in a very remarkable degree of sometimes thus thinking the

truth, as when, for instance, he thus thought the truth, that the blood is alive in the same sense as are all other parts of the living body. "And I find," observes Sir James Paget, "at least there is one instance of his projecting his mind far into a doctrine of evolution. When writing on Hermaphroditism, which he studied carefully, he says, in a footnote, 'Query: Is there ever, in the genera of animals that are natural hermaphrodites, a separation of the two parts, forming distinct sexes? If so, that may account for the distinction of sexes ever having happened.'"

Hunter was, as we might expect, one of those philosophers who thought over that great question which has been so often asked, What is life? He spoke of life as a vital principle, as something separate from organisation. He did not regard it as material, or any property of matter. He probably meant by vital principle that which Joseph Henry Green, the most eloquent and philosophical of his interpreters meant—a power anterior in the order of thought to the organisation which it animates, sustains and repairs—a power regenerative and constructive. But Hunter could not clearly express this, and perhaps he could not clearly think it, for he wrote so obscurely that we cannot but believe that his own mind was often in uncertainty and confusion.

Nevertheless it is remarkable what a careful estimate he made of the relative values of hypotheses and facts. He bore well that severest test of the scientific mind, the test of its power to resist subjection to its own hypotheses, Feeble men worship the work of their own minds; they fall down before their own idols, made of words; they have more confidence in their principles than in plain facts.

The orator then drew attention to several points in the life and character of Hunter, which we can barely mention. Such as the great man's unconsciousness of his own mental power, his achievements in physiology, how he of his own force, and without any model to work upon, saw and taught the whole science of life, the success with which he raised surgery to the dignity of a science, and surgeons themselves in the estimation of the profession and of the public. More than any man that ever lived, Hunter helped to make us gentlemen, and that not by any personal qualities, or by wealth, or by social position.

In the course of his splendid oration Sir James Paget made a digression which we cannot help noticing, as it gives us with respect to an all-absorbing problem an insight into the mind of one whose opinion is entitled to the greatest respect. The remarks, however, to which we wish to draw attention are the only part of his eloquent discourse which might provoke criticism, and which we think must have elicited a smile from two of his most appreciative listeners, Professors Huxley and Tyndall. In speaking of the nature of life, Sir James asks: "What is life, and whence is it derived? Is it anterior to the organisation? is it a power originative and constructive? Now I cannot doubt that in the doctrine of the correlation of physical and vital forces we are nearer to the truth than we were in the Hunterian doctrine, which held that life is something altogether alien and different from other forms or methods of activity; but holding the correlation and mutual conversion of the forces does not determine the precedence of either the one or the other. If the vital and physical forces are mutually convertible, either may have preceded the other; the vital force may have preceded the physical, although life appeared late upon this planet, in any of the phenomena in which we can now study it. . . . . Mental forces may have preceded physical; mind may have existed before any of the properties of matter; and therefore, in the view of science, the first essence may have been a Being willing and self-conscious, and the prime source of all the forces whose operations we now trace. I believe there is not anything in science to disprove such a belief as this; but I doubt whether it be in science yet to determine an order of precedence amongst the forces. I cannot imagine anything before the natural force, except a supernatural will; and a belief of this kind is held by untutored minds as if it were instinctive knowledge. For man seems naturally prone to believe that beyond all that there is in the world there must be a mind or minds in the likeness of which his own is created, and with which he is in some kind of personal relation. But science cannot yet reach to the proof of these things; and, until it can reach to proof, science cannot rest and must not rest; bnt the firm and self-guiding belief in a supernatural will and knowledge rests on the basis of the whole and manifold evidences of the Christian faith. This may seem often opposed to what we believe to be true in science. Then let us wait. Time —or if not time, eternity—will prove that science and the Christian theology are but two sides of truth. It will prove yet more, that both sides are as yet only known in part."

We do not wish to enter upon the subject of materialism or immaterialism, but who will say that such a confession of faith is not ennobled when it comes from the mouth of one who thinks as deeply, reasons as acutely, and expresses his thoughts in as clear and intelligible language as the most eminent sceptic, or the most ardent materialist living.

Altogether, the oration is one of the best that have ever been given in praise of Hunter, while the judgment which Sir James Paget has passed upon the character and teachings of that great man is more just and discriminative than any that has been passed upon him before. No doubt the oration will soon be published in a more permanent form, and then it should be in the hands of every member of our profession, and indeed of every one who would recall the story of a scientific life, and the history of the greatest surgeon of all times, and who would enjoy the intellectual treat of seeing a noble subject treated in the noblest style.

WARBURG'S TINCTURE.

In the current number of the *Practitioner* there is an interesting communication from Dr. Broadbent, on the therapeutical action and uses of this celebrated tincture.

There is no subject in which the medical practitioner should feel so much interest as in the discovery of any agent that is possessed of extraordinary medicinal virtues. As a science, and as the basis of a rational system of medicine, pathology must always command a large share of our attention; but, unfortunately, pathology has done

little towards advancing our knowledge of practical therapeutics, nor has it led to the discovery of any of those great medicines or therapeutical agents which now serve us as so many sheet-anchors in our battle with disease. We have been indebted to mere accident, or to popular usage, or to the instinctive habits prevalent among the natives of some foreign country ; and to such sources we may still look for fresh additions to our medical armamentaria.

Warburg's tincture has long held a high reputation in India as a remedy of "undoubted and, indeed, unequalled power" in the treatment of the malignant malarial fevers of that country and of cholera. For a long time it was a secret remedy, but in 1875 Professor McLean made known its composition, and gave his unqualified support to all that had been said in its favour.

The ingredients of this compound are very numerous, and in this respect its composition reminds us of the complex formulæ to be found in our old dispensatories—such, for instance, as the once celebrated Theriaca Andromachi, or the still more celebrated Mithridate. It consists of aloes, rhubarb, saffron fennel, gentian, cubebs, myrrh, camphor, zedoary root, enula, and angelica seeds. It also contains the confectio "Damocratis," consisting of innumerable aromatic substances, and which was officinal in the London Pharmacopœia of 1746. Prepared chalk (which was added to correct the otherwise acrid taste of the tincture) ; and Boletus Laricis, or larch agaric, formerly used as a drastic purgative. Its most important ingredient, however, is quinine, each ounce of the tincture containing as much as nine grains and a half of the alkaloid. The tincture is of a deep brown colour, has an aromatic and slightly terebinthinate odour, and an intensely bitter and warm aromatic taste. But its spirit is not perceptible either to taste or smell, and it seems (remarks Dr. Broadbent) as if the alcohol were entirely saturated and, as it were, extinguished by the substances taken up.

In reference to the large quantity of quinine the tincture contains, in combination with what some might term "a farrago of inert substances," Prof. McLean observes that he has treated remittent fevers of every degree of severity in various parts of India and China, but he has never seen quinine, when given alone, act in the manner characteristic of this tincture. He has never seen a single dose of nine grains and a half suffice to arrest an exacerbation of remittent fever, much less prevent its recurrence ; while nothing is more common than to see the same quantity of the alkaloid in Warburg's tincture bring about similar results.

Dr. Broadbent is disposed to attribute the extraordinary virtues of this tincture to three therapeutical principles—namely, the combination of quinine with powerful aromatics, the highly concentrated state of the tincture, and the powerful impression made by it upon the nervous system. This opinion is supported by several facts and considerations to which our attention is drawn by the author of the paper referred to, as well as by others that have come under our own observation. With regard to the influence of aromatics, we are reminded how often the action of quinine is aided by stimulant and aromatic adjuvants. We have been long in the habit of giving a moderate dose of the tincture of capsicum with each dose of quinine, and found that by this means a large dose of the alkaloid could be given without giving rise to the usual symptoms of cinchonism. Dr. Broadbent states that he has been equally successful by using ether as the adjuvant. We have always thought that the use of powerful aromatics is very much neglected at the present day. Formerly they were largely employed, and it is supposed that the great success with which Sydenham prescribed his favourite drug opium, was owing to the aromatics which he invariably combined with it.

But that the efficacy of the tincture is also due to its *concentration* and its administration in an undiluted state must not we think, be for a moment doubted. Concentration is, as Dr. Broadbent puts it, the principle in virtue of which a dose of neat brandy will rouse the flagging action of the heart, when the same quantity diluted would completely fail, or why a single large dose of quinine is frequently far more efficacious than several small ones, or why a drachm of laudanum will in *post-partum* hæmorrhage restore consciousness, rouse the uterus to action, and arrest the hæmorrhage, when "six times ten minims" in water would allow the patient to bleed to death.

Nor would we deny that the *modus operandi* of this concentrated and highly aromatic medicine depends upon the powerful impression made by it upon the nervous system. It is when such an impression is especially indicated that Warburg's tincture will be found most useful—when, as Dr. Broadbent says, the nervous system is "overwhelmed by some poison, as in malignant remittents, or oppressed by pyrexia, or sinking under some depressing influence." In calling to mind some examples of the striking remarkable curative effects due to an impression on the nervous system, Dr. Broadbent says that competent observers have assured him that the premonitory diarrhœa of cholera, and even the declared disease at the outset, may be cut short by a combination of strong stimulants, such as ammonia, ether, and tincture of capsicum. But, "you must bring tears inte the eyes," said his informant. The correctness of this therapeutical principle is also forcibly impressed upon our mind by an incident which happened in the life of an eminent physician with whom we were long intimately acquainted. Many years ago, whilst cruising off the most pestilential coast of West Africa, he was attacked with a malignant fever of the worst type, and accompanied by uncontrollable vomiting, There were no medicines worth mentioning at hand, but as his case became desperate, and as he was fully aware of the principle just inculcated, he ordered a small teaspoonful of Cayenne pepper to be given him in a tumbler of brandy-and-water. The effect, we have often heard him say, was magical. The vomiting ceased, he broke out into a perspiration, and speedily recovered. The remedy was certainly heroic, and quite calculated, we should think, "to bring tears into the eyes."

It is evident that such a preparation as Warburg's tincture will be most appreciated by medical men who are practising in hot and pestilential climates, but a knowledge of its ingredients, and of the *modus operandi* of the preparation as a whole, will convince the reader that there are many cases even in this country in which it will be found most useful. Dr. Broadbent describes the case of an old gentleman in whom delirium, complete unconscious-

ness, general muscular tremor and jactitations, and all the signs of approaching death were removed by a few doses of the tincture. Instead of finding the patient on his arrival moribund or dead, as he expected, he was in a quiet sleep, and bathed in a warm perspiration, while the whole room was fragrant with the aromatic constituents exhaled by the lungs and skin.

Had this tincture merely been a preparation which acted in some specific and unknown manner, we should not have thought ourselves justified in calling particular attention to it. But its action undoubtedly rests upon certain therapeutical principles which are very apt to be neglected at a time when our faith in drugs has been shaken in so many ways. We do not wish so much to extol the tincture itself as the principles which are at the bottom of its successful operation. The tincture may change, or like many other remedies before it, fall into disrepute, or, other combinations equally powerful may be discovered. But truly scientific principles are always the same, however much they may be forgotten for a time, and it is because we would not have the reader lose sight of such principles that we have ventured to make this article rather longer than we originally intended.

Notes on Current Topics.

Dangers from Santonine.

In using santonine, it is well to bear in mind that comparatively small doses have produced convulsions of a somewhat grave character. A German contemporary lately reported a case in which poisonous effects were produced in a child two years old, by the ingestion of so small a dose as a grain and a half. Convulsions commenced in the face, and extended to the extremities, while the respiratory action was greatly impeded. Under warm baths, enemata, and artificial respiration, the patient recovered. The physician in charge of the case then instituted a series of experiments on the lower animals, and found that chloral and ether inhalations controlled the convulsions produced by santonine. He naturally argues that the same treatment should be pursued in the human subject when a poisonous dose is taken.

The Action for Libel against the "Medical Press and Circular"

The able London correspondent of the *Philadelphia Medical Times* has given, in the January number of that paper, a full account of the case that was recently decided against us. The report which he has given is so good and is written with so much humour that we may be excused for quoting the greater part of it.

"The different ways," says the writer, "of adding to the professional income adopted by the more highly educated aspirants to practice are well known; but for those who have entered upon their professional life with a limited amount of intellectual capital, these ways will not work. Consequently, they have recently adopted a plan which apparently is profitable and lucrative and yet has a *soupçon* of benevolence about it. Provident dispensaries has been the favourite game of a large number of men. In reality these are often but private places of business, where the proprietor sits at certain hours and gives medical advice and medicine for a fixed sum. Usually the sum has been fixed at one shilling. A large number of these so-called Provident Dispensaries have been established, especially in poor neighbourhoods, and have been well patronised by the poor. It so happens that the writer knows something of the working of the institutions. Meeting one day casually an old college acquaintance who had not been seen for many years, mutual inquiries were made as to what each was doing. Knowing that my old acquaintance was a man who studied the world and its ways, and yet had certain ways of his own which militated against his going in for high-class family practice, my curiosity was excited as to what scheme he had evolved. He had started a Provident Dispensary, and sat two hours every morning and an equal time every evening, and saw patients for a shilling each, to include advice and medicine. He described it as a paying kind of business, the shillings thus received forming the bulk of his income. He is a shrewd man, of great parts in his way, and assured me that too careful and too prolonged examination of a patient was regarded by his clients as indicating a want of capacity and consequently was injurious. They preferred a quick and prompt decision. The advantages of such prejudices to a man who is shrewd are obvious; and in this perhaps more than in other department of the profession is required a competent knowledge of the world rather than extensive professional knowledge; though the first is essential to great success in every branch of it. Of course the connection so formed led to further practice, such as visits at home and midwifery. One or two accidental rencontres followed at intervals, and each time my quondam acquaintance looked sleeker and more prosperous. He informed me that he had opened a branch practice and kept three assistants, so that he did little work himself; and the last time I saw him he was driving a well-appointed phaeton, with a high-stepping horse in the shafts, and a man in livery behind him.

"Of course this arrangement, by which patients get advice and medicine for the modest sum of one shilling, has increased greatly of late, since it has been found lucrative and easy in its working. So profitable, indeed, has this line of practice become, that a less sum than a shilling seemed feasible, and at least one qualified man has publicly announced by circular that at his dispensary advice and medicine may be procured for fourpence in the morning and sixpence in the evening, his tariff for home visits being arranged on a similar scale, so as to be within the reach of all but the absolutely destitute. This seemed to the editor of the Press and Circular to be carrying the thing a little too far, and consequently he gibbeted this enterprising gentleman in its columns, giving a fac-simile of his advertising sheet, and commenting thereupon. The editor gave it as his opinion that the advice would not be of a very high order nor the medicines very expensive which were furnished for fourpence, and indulged in some reflections which so galled this follower of Æsculapius that he went to law and laid his damages at one thousand pounds. However, the damages were assessed at a sum nearer his own charges, and his feelings are, no doubt, soothed at the notion of having had his revenge on his critic. A good many of the profession have thought, however, that the Press and Circular has been discharging its duty to the profession by its conduct, and so an influential meeting has been held in London to express their sympathy and approval.

[Here follows a brief account of the meeting with which, however, our readers are already familiar.]

"A similar meeting has been held in Dublin, with like results. It has also been determined at both places to get up subscriptions to aid in defraying the expenses of the journal. I have not come across the gentleman with the phaeton and high-stepping horse since this meeting, and, not being aquainted with any one else in that line, I do not know what the owners of these provident dispensaries say; but the voice of the rest of the profession has been

distinct enough on this subject. As to the profits actually made, my informant told me that he got his shilling 'clear'—all profit. This seemed absolutely incredible, as even the cheapest medicines cost something; but he demonstrated how it was done. A considerable number of his patients neglect to provide themselves with a bottle, and provision is made for these thoughtless individuals, who can procure from a dispenser a bottle for a penny. These pennies purchase the bottles and all the medicine prescribed. The arrangements for getting the maximum of medicine for the minimum of money showed considerable shrewdness; and sulphate of magnesia, sulphate of iron, and quassia form a compound of some potency, of which a great deal may be made by a very moderate outlay. Taking these facts into consideration, it becomes possible to see how even fourpences, if there are a sufficient number of them, may leave a margin on which an enterprising individual may contrive to do something more than subsist."

The Internal Administration of Chloroform.

M. JAILLARD, a French army *pharmacien*, after alluding to the difficulties that occur in the internal administration of chloroform, states that the following simple procedure is by far the best:—The prescribed quantity of chloroform should be poured into from 100 to 120 grammes of milk (which may be either pure, or sweetened and aromatized with a few drops of cherry-laurel water) and then briskly stirred. The chloroform, in this way, becomes easily divided into an infinity of minute globules, exactly resembling in appearance the fat globules which exist in the milk, in the midst of which they remain suspended for an indefinite period.

The Small Pox Amongst the North American Indians.

LATE official advices state that the most terrible outbreak of small-pox ever known in the history of the North-west is desolating Gembic, an Icelandic and Mennonite settlement of about 7,000 souls on the east side of Lake Winnipeg. The deaths average 18 a day. No medical men are on the spot, but the Manitoba Government is endeavouring to obtain doctors. The scourge is also raging with terrible fury on the west side of the lake. The Fort Thunder Indians have been decimated, and hundreds have died in settlements on the Qu' Appelle river. Indians are fleeing south toward the boundary line. The fur trade is stopped throughout the North-west, by order of the authorities.

Another Guesswork Irish Coroner's Verdict.

THE coroner for the northern division of the County Kildare held an inquest on the body of the son of a farmer who died suddenly on the previous night. The evidence of the relatives, none of whom could throw any light on the cause of death, having been heard, Dr. Joseph Smith swore as follows:—I have *seen and examined* the body; there are no marks of violence; there is not evidence enough to explain the cause of death; it is my opinion that he died of heart disease, and that a *post-mortem* examination would not throw much light on the subject.

The jury found "that there are no marks of violence, and that his death was natural from heart disease."

The subject of this inquest came home half drunk; he may have received violence, or may have been poisoned, and the medical witness undertakes, from having "seen and examined" the outside of the body, to swear that he died of heart disease, which sage opinion of course the jury at once recorded as their decision. From the evidence as reported there is not the shadow of a reason to suppose that the man then or ever had heart disease, and it is quite possible that some crime escapes discovery to save the expense of a *post-mortem* examination. It surprises us that medical men consent to be made use of for such purpose.

Workhouses in Ireland.

MR. MACARTNEY, M.P., has given notice that on the 6th of March, he will "draw the attention of the House to the excessive number of workhouses in Ireland as compared with the number of paupers requiring relief, and will move for a Select Committee to take evidence and report as to the best means of promoting their amalgamation." On the 24th of April, the Bill to provide for the election of Poor-law guardians by ballot, will come up for a second reading. It is not likely that either proposal will produce any present result, but they will create discussion and investigation which cannot be but salutary.

The Late Vicomte de Kergaradec.

La France Medicale contains an obituary of this veteran of the profession, so well known to English obstetricians in connection with the placental *bruit*, upon which subject he published a *memoire* in 1822, and for which he was admitted a Member of the Academy of Medicine of Paris in 1823.

His researches and opinions have been disputed, and more recent investigators have decided, according to Churchill, that the sound is situated in the uterus, and not in the placenta. He also published a notice on Lænnec, and delivered a lecture January 8th, 1861, before the Academy of Medicine "On the Duty of Performing Cæsarian Section after the Death of the Mother."

He considered the question in a legal, medical, and religious point of view.

His life was devoted to literature and agriculture, more than to the practice of his profession. He died in Paris within the last few days, at the advanced age of ninety.

The Carlow Workhouse Election.

IN reference to the statement contained in Dr. O'Meara's letter to us, that Dr. Rawson had made his canvass for the appointment and secured his election before his father's resignation, we have received a letter from Dr. Rawson, in which he says:—

I did not commence my canvass until my father had publicly stated before the Board of Carlow Union that he intended to resign in a few months, feeling that he could not conscientiously perform his duties to the sick, in cases of chest disease, as he was unable, from deafness, to use the stethoscope, which intimation appeared in the local papers. I deny that the politico-religious element was introduced by my friends, nor do I believe it *ever* entered their heads, even after the articles alluded to by Dr. T. P. O'Meara appeared in one of the daily papers.

Despite the disclaimer of both candidates for office, there is no doubt that the politico-religious squabble was

a powerful element in the election. It is a melancholy evidence of the interference of extraneous considerations with the choice of medical officers in Ireland that, in this instance, the religious passions of the county seem to have been stirred by so small a matter as the selection of a workhouse doctor at a puny salary.

The Irish Prisons Bill in its Medical Aspect.

LATE in last session of Parliament, the Irish Prisons Bill was introduced by Sir Michael Beach, and, on examining its provisions, the Council of the Irish Medical Association discovered that it gave power to the newly created Prisons Board, to transfer any officer from his own prison to any other in Ireland, and made his refusal to move on tantamount to resignation of his office. It was obvious that such a proviso would be intolerable to the medical officers who might, and if they were not on the best terms with the Board, would probably be subjected to great inconvenience and loss, and readily ousted from office by a summary order of transfer to another district. Thereupon, the Council directed the hon. sec. to write to Sir Michael Hicks-Beach on the subject, and explain that medical officers of prisons in Ireland were private medical practitioners, upon whom it would be an injustice to place such restrictions, and the Chief Secretary replied that the matter should receive attention. We are gratified to observe from a perusal of the Amended Bill now going through the House of Commons, that Sir Michael Beach has not forgotten his promise to the Association. In the 24th section, which authorises this transfer of officers, a phrase is introduced which specially exempts medical men from its operation. It provides that all officers may be removed from place to place saving "any local inspector, chaplain, medical officer, or apothecary." It is fortunate that these representations were made to the Chief Secretary by the Association; for, if the Bill had remained as it was, the office of gaol surgeon would have remained untenable.

The Crescent and the Cross.

THE Geneva Cross, the emblem of Christian salvation, was considered a fitting badge to ensure protection during the time of war, for surgeons, assistants, nurses, and the *tout ensemble* of an ambulance.

It seems, however, that we forgot that christianity is not the religion of the whole world, and at the last sitting of the Society of Practical Medicine of Paris, under the presidency of M. Duchesne, Dr. Thelmier proposed to modify the sign adopted by the Geneva Convention, as the recent experience of the East showed that the red cross did not offer sufficient guarantees of safety, as it aroused feelings of hostility amongst the Mussulman population.

Dr. Thelmier suggested a less significant emblem, as, for instance, a star. We are all creatures of ideas, and all nations have national prejudices and antipathies, so that we fear a star, the partial emblem of the United States would also have its opponents. We must consider the weaknesses of human nature, and without yielding to Turkish bigotry, no harm can result from considering this proposal, and substituting some emblem that may not press on any creed or nationality.

A New Disinfectant and Antiseptic.

AT a meeting of the Society of Arts on Thursday last "On some Processes of Nature's Hygiene" was read by Mr. C. T. Kingzett, F.C.S. The paper was a very interesting one, and suggested important improvements in the production of antiseptics, disinfectants, and albumen of commerce. The reader's researches had for their immediate object the elucidation of the nature of the active principle which is formed when turpentine and other oils and substances underwent atmospheric oxidation, illustrating the results by certain chemical formula. It had been at first difficult to understand the virtues of the Eucalyptus as a preventive of malaria, but the explanation was both interesting and simple. The various species of pine or fir trees all secreted oils, which might be considered as turpentine, and which, if allowed to remain in the tree, volatilised in great measure, and underwent oxidisation in the atmosphere. In pursuing his investigations he found that when turpentine was exposed to a current of air in the presence of water oxygen was absorbed, part of the oil resinified, and the rest was oxidised into a compound, unstable in the presence of water, and splitting up thereby into peroxide of hydrogen and camphoric acid, the former of which had long been acknowledged to be one of the most powerful disinfectants known to chemists. The result of his experiments in the direction of the oxidation of turpentine was the discovery of a solution which had been christened "Sanitas," and which he claimed to possess a power of preservation and disinfection superior to that of its own components taken singly, and to that of any other known antiseptic or disinfectant, the presence of camphor and other bodies being conducive towards securing the result sought for. By a similar process Mr. Zuglei and himself had also been able to prepare a blood albumen of a whiteness and quality comparable to egg albumen, the use of which would restore a large amount of food to the market. This was the first instance on record in which a natural process of atmospheric purification had been imitated to perfection; until, in fact, there could now be repeated on a commercial scale that which in pine and Eucalyptus forest constituted one of the most efficacious processes of nature's hygiene.

Quack Medicines in France.

THE monopoly in English quack nostrums, as regards Continental sale, seems to have been satisfactorily overthrown by a judgment pronounced recently in Paris. The English proprietors of Morison's pills had made an arrangement with their French agent that he might use the name of Morison with certain reservations. The agent, it was alleged, abused this license for his own benefit, and the proprietors of the pill took an action against him to stop the infringement, and to recover damages. The agent pleaded that the pills being a secret remedy not authorised by the administration, after preliminary approval by the Faculty of Medicine, the sale of them in France was contrary to law, and consequently the proprietors could not maintain an action in respect of such sale. The Court agreed in this view, and ruled as follows:—

Considering that it has not been proved that the formula according to which Morison's pills have been prepared

is inserted in the Codex; that this medicament has not been submitted to the Academy of Medicine for examination, and that the Minister of Agriculture and Commerce has not authorised the preparation, advertisement, and sale of the same;

That in consequence it (*sic*) must be considered as a secret remedy.

Considering that the sale and advertisement of secret remedies are prohibited and punishable by law;

Considering that in placing on sale the said pills, and in advertising them for sale, either by circulars or by labels attached to the boxes which contain them, Evrard and Morison have committed culminatively the double misdemeanour which the laws and decrees would repress;

Considering that a pharmaceutical product, sold as a secret remedy, and without the necessary legal guarantees cannot claim the protection of the law in respect to infringement of right;

Considering that it would be contrary to legality, morality, and public order, if litigants could obtain damages in respect to even unfair competition in business forbidden by the law;

Declares, &c. (Here follows the judgment, which we have summarised above.)

The law of patent medicines is certainly one of those "things they do better in France." It is not to be expected that the "nation of shopkeepers" which derives its public income in great measure from the trade in opium-eating, whisky blending, and adulterated goods, will ever see its way to protect the community against quack secret remedies.

A Rural Hygeiopolis in Ireland.

At the last meeting of the Athy Sanitary Authority the sub-sanitary officer having been directed to obtain samples of the water of several of the private pumps of the town and forward same for analysis, the clerk laid before the guardians the following report:—

"Such a collection I never before had to report upon. With the exception of Nos. 3 and 8, they are simply sewage. They contain an enormous amount of mineral matters, and an immense quantity of sewage. It is almost like a joke to describe them as waters. No. 8 is very hard, and of doubtful quality. No 3 is a very hard water. The rest are as stated no better than sewage.

"C. A. Cameron,
Analyst for County Kildare."

One of the guardians said—I may tell you, gentlemen, I am not at all suprised at the report, for I went to examine a number of these private pumps when it was contemplated to utilise them by means of pipes for the public use, and I found them all situated within a few feet of privies, dung heaps and sewers. I am of opinion the entire soil of that neighbourhood is impregnated with sewage matter, and if possible worse. There have been pig fairs held there for years and years, and with an open, porous soil, we can well imagine what the nature of it must be now.

It was ordered that a special meeting be covened to take into consideration the whole matter of the water supply of the town; and, in the meantime, notices be posted on each of the condemned pumps that they were "dangerous to use for domestic purposes."

Professor Lister, of Edinburgh, has been elected a Corresponding Member of the Société de Chirurgie of Paris.

Coroners in Ireland.

The antiquated inquest system in Ireland, of which so frequent complaint has been made in our columns, is evidently drawing towards its end, and when it pleases Parliament to remove it, it will assuredly die "unwept, unhonoured, and unsung." Four years ago the subject was taken in hand by Mr. Vance and Sir John Gray, but the death of both these gentlemen brought their efforts to a premature end. Since then nothing has been done except the passing of the Dublin Coroner's Act, a scandalous job, perpetrated by the Dublin Corporation for the benefit of an individual. That measure was not resisted by Sir Michael Beach, because he contemplates dealing with the whole question, by a Government measure as soon as possible. Meanwhile, Mr. Verner, the member for Armagh, has placed on the notice paper a motion for a Select Committee "to inquire into and consider the position of Coroners in Ireland." Never was inquiry less necessary or reform more needed, for everyone knows that neither the public nor the police attach any confidence to the findings of inquest juries in Ireland. Verdicts by guess-work, or directly contrary to evidence, delivered by ignorant peasants at the dictation of coroners, whose competency to form a judgment is more than doubtful, are of daily record in the papers, and "coroner's law" has thus come to be a synonym for a legal farce. We look for Sir Michael Beach's Bill with interest, and we trust that it will deal with the question thoroughly, and not be a mere patching of the old system. Such a Bill should ensure: 1. That coroners shall be qualified for their duties by legal and medical education, and shall not be merely the failures of their profession or worn-out political pensioners; 2. That they shall be paid a fair salary and made to do their duty; 3. That they shall be made answerable for the falsity of verdicts arrived at in the absence of sufficient medical evidence; 4. That they shall have no inducement, as they now have, to withold such evidence; 5. That their duty shall be to investigate the cause of death and that only, and that their inquest shall not be converted into a trial of accused persons, or an equity suit for the settlement of insurance disputes. At present coroners have too much and too little discretion, for while the law puts upon them many responsibilities which they have no right to bear, it enables them to get rid of this responsibility by dictating haphazard verdicts to juries who are often vacant of the least ray of intelligence or education, and who would find a verdict of "spontaneous combustion," if the coroner bid them do so.

The Gulstonian Lectures of the Royal College of Physicians of London will be delivered on Feb. 23, 28, March 2, by Dr. Lauder Brunton, "On Pharmacology and its Relations to Therapeutics."

The medical officer of health for Barnsley reports that there have been 57 cases of typhoid fever at Barrowford as the result of taking milk of a farmer who had typhoid fever in his house. Of this number eight have already died.

The annual death-rate last week was only 16 per 1000

of the population in Edinburgh and 22 in London, whilst in Glasgow it was 27, and Dublin 32, the latter having risen to the highest death-rate of all the large towns in the United Kingdom.

THE deaths from small-pox were considerably less last week than in the previous week. Ninety occurred in London, 14 in Liverpool, 4 in Manchester and Salford, 1 in Oldham, and not one in any of the other large towns of the United Kingdom.

AT a General Court of the Highland Society on Saturday afternoon, Professor Erasmus Wilson, who, has undertaken, at his own expense, the experiment of bringing Cleopatra's Needle to this country, referred to the manner in which it was proposed to deal with the obelisk, which weighs 200 tons.

To hear the Hunterian Oration delivered by Sir James Paget in the theatre of the Royal College of Surgeons of England last week, it is computed that at least a couple of hundred were unable to obtain admittance; whilst to those who were fortunate enough to get inside it was an uncomfortable squeeze.

THE gathering of the profession at Euston Station on Wednesday evening last to do honour to the remains of Sir William Fergusson on their transmission for entombment in Scotland was very large—estimated from 1,500 to 2,000. There was also a strong contingent of students chiefly King's men.

IT is rumoured that the honour of knighthood will be shortly bestowed on Mr. Prescott Hewett. The bestowal of a distinction upon the present President of the Royal College of Surgeons, who is also Sergeant-Surgeon-Extraordinary to Her Majesty, would meet with a general approval on the part of the profession. A knighthood and a baronetcy have been conferred upon two successive Presidents of the College of Physicians, and the present is a convenient opportunity for conferring an honour upon the College of Surgeons, and at the same time recognise the personal merits of its President.

ON Saturday last a man, named Hunter, formerly a clerk in the Savings Bank Department of the Post Office, was charged at Bow Street Police Court for impersonating another not yet in custody, and obtaining by fraudulent means the diploma of the Pharmaceutical Society of Great Britain. The authorities have arrested the individual for whom Hunter acted, whose name is John Colegrove, lately resident in Castle Street, Liverpool, and on Monday he was brought up at Bow Street Police Court and remanded.

A CASE of death by suffocation happened at the house of a farmer, near Newcastle West, in Limerick. Two daughters of the owner, with a servant girl, slept in a room together, and one of them took up some fire in a pot, there being no fireplace in the room, and closed the door. During the night some person came to the room, and on going in found them all quite insensible, and one girl, about fourteen years of age, dead from suffocation.

THE late Dr. Henry Charles Barlow, of Newington, has bequeathed all his Dante books and manuscripts, and £1,000 Consols, to the London University College, the income of the money to be applied to the delivery of twelve annual public lectures on the "Divina Commedia." —Mr. Thomas Clarkson Osler, late of Edgbaston, has left £200 to the General Hospital, the Queen's Hospital, the Sanitarium at Blackwell, and £100 to the Hospital for Sick Children.—The late Mr. James Barstow, formerly of Gray's Inn, has left £200 to the University College Hospital.

NOTWITHSTANDING the reiterated statements of the presence of fever to a serious extent Brighton rises from the attack as one of the most healthy towns in the kingdom. According to the annual report of Dr. Kebbell, medical officer of health for Hove, just issued, we find that, "taking the birth-rate 20·5, and the death-rate 14·7 per 1,000 of the living, compared with a mean annual death-rate of the town population in the country of 24·4 per 1,000 and a mean birth-rate of 35·4 per 1,000 of the living, the death-rate is 10 per 1,000 and the birth-rate 15 per 1,000 under the average. The records of deaths show a very satisfactory state of the health of the district during the last year. The number of deaths from the zymotic class of complaints is somewhat higher than the previous years owing to a rather severe epidemic of measles which prevailed in the district during the spring quarter of last year.

Medico-Parliamentary.

VACCINATION.

IN the House of Commons, on Thursday last, MR. S. BOOTH, in reply to Mr. Wethered, said the Local Government Board had heard of the death of three children near Gainsborough from eyrsipelas following from vaccination, and an inspector had been asked to make a careful investigation into all the circumstances of the case. It was true that the children were vaccinated from lymph taken from a child which had been vaccinated from points supplied by the National Vaccine Establishment. That child, however, was not suffering from erysipelas, and it seemed certain that the lymph furnished from the child did not contain any infection of erysipelas. Moreover, there was no reason to suppose that the infection in any of these cases arose from the lymph used. Several other cases of erysipelas had occurred in the district, some following vaccination and others having no connection with that operation. The whole of the circumstances were dealt with in the report of the inspector which would be laid on the table of the house.

ARMY MEDICAL DEPARTMENT.

MR. HARDY, in answer to Mr. Dunbar, said that 23 candidates had presented themselves for admission to the Army Medical Department—50 appointments were offered for competition; and 49 candidates had presented themselves for the 27 appointments in the Indian Medical Department.

The Profession at Her Majesty's Levee. —On Thursday last a levee was held at St. James's Palace by his Royal Highness the Prince of Wales on behalf of the Queen, of which the following members had the honour of presentation, who were, with one exception, connected with the public medical service: —Surgeon-General Balfour, Dr. George Birdwood, on being made Companions of the Star of India; Fleet Surgeon Belgrave Ninnis, M.D., on return from Arctic service; Surgeon C. W. Owen, Bengal Medical Service; Dr. W. S. Playfair, Surgeon R. V. Power, Madras Native Infantry, Surgeon John Walker, M.B., and Surgeon J. B. Wilson, M.D.

Correspondence.

TESTING THE HEARING POWER.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In the very interesting and practical remarks on "Aural Affections," which appear in your issue of this week, Dr. McNaughton Jones draws attention to the fact, well known to practical aurists, that frequently "while the conversational power is not impaired, the hearing distance, as measured by the watch, is considerably so." In these cases the patient will often say he *hears* the watch because he *sees* it, much in the same way as another will say he *hears* the vibrations of the tuning-fork on contact when he only *feels* them. On this account I always, in proceeding to test the hearing of a patient with a watch, direct him first to keep the eyes closed. This precaution is useful, not only in the first instance, but also later in the progress of a case, the improvement in the hearing power can be measured by means of the watch, when, from long habit of deafness on the part of the patient and of loud talking on the part of relatives, no decided improvement has been experienced in conversational hearing power. The fact that I have not seen mention of this hint of closing the eyes in any treatise on deafness must be my excuse for troubling you.

Yours, &c.,
LENNOX BROWNE, F.R.C.S. Edin.

36 Weymouth Street, W.,
Feb. 8, 1877.

FEMALE MEDICAL CANDIDATES AT THE KING AND QUEEN'S COLLEGE OF PHYSICIANS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In your issue of yesterday, 14th inst., you commented upon the action of the King and Queen's College of Physicians in Ireland with regard to the admission of female candidates for the licences of the College, basing your remarks upon the admission of Miss Walker-Dunbar, M.D. Zurich, 1872, at the examination held last month.

In the course of your remarks you make the following statement;—"We are surprised to find the Irish College of Physicians is bidding hotly for the patronage of the lady doctors, by accepting from them curricula which they would not receive from a male student. They have, we are informed, altogether exempted Miss Walker-Dunbar from examination in certain subjects in consideration of her holding the M.D. of Zurich. Thus they have recognised as evidence of competency a foreign degree which was unanimously refused admission of the profession last year, and which if presented by a masculine medical student, would have been unhesitatingly refused."

To this statement I beg to give an unqualified denial, and for your information and that of your readers I beg to furnish you with the following extracts of the bye-laws and resolutions of the College bearing on this question, calling your particular attention to the dates affixed.

Bye-laws, chapter vi., page 20 (relating to examinations):—

Candidates qualified as follows are required to undergo the second part of the professional examination only—viz., 1. Graduates in medicine of a University in the United Kingdom, or of any foreign University approved by the College. 2. Fellows, members, or licentiates of the Royal College of Physicians of London or Edinburgh, who have been admitted upon examination. 3. Graduates or licentiates in surgery. 4. Candidates who having completed the curriculum laid down in paragraph 3 of this chapter, shall have passed the previous examination of any of the licensing corporations in the United Kingdom.

The last of the foregoing conditions was adopted by the College in June 1869, the first three in 1862.

Resolution of the College, adopted December 5th, 1873:—

"That the Diploma in Medicine, Surgery, and Midwifery, of the University of Zurich, be accepted, under the bye-laws, as entitling the holder to undergo the Second Part only of the Professional Examination."

By the foregoing you will perceive that holders of the degree of M.D. Zurich, are exempted from no other portions of the subject of examination than a candidate who has obtained the First Half of any of the Licensing Bodies enumerated in Schedule A of the Medical Act.

I would further state that a similar privilege has been extended to holders of Degrees in Medicine of

The University of Melbourne; Trinity College, Toronto; Harvard University (Mass.); University of New York; University of Pennsylvania; and of the New York Medical College.

I have the honour to be, Sir,
Your obedient servant,
J. MAGEE FINNY, M.D.,
Fellow and Registrar.

Dublin, February 15, 1877.

[We were aware that graduates in medicine of a home university or of a "foreign university approved of by the College" were exempted from the first half of the examination for the licence of the College of Physicians, but we were *not* aware—nor do we know where the information is to be found—that any other foreign university, but that of Zurich, had been admitted by the College to such privilege. In reminding us that the College grants privileges of exemption to other foreign universities, the Registrar raises the larger question of the propriety of their doing so. What knowledge, we would ask, has the College of Physicians of the educational and examinational requirements of Zurich or any other foreign university? Have they not granted very special and liberal privileges to the graduates of these institutions on the merest breath of popular rumour? Are they prepared to withdraw these privileges under any circumstances, and, if so, on what information are they to act? The medical curriculum and examination of the Zurich University may be all that is considered necessary in Switzerland, but what knowledge have we whether or not it is on a level with that of British licensing bodies? Upon this question the College is at diametric variance with the expressed feeling of the General Medical Council, and its own conversion to the view which it now holds is very recent. As lately as the 17th of April, 1876, the College expressed itself as strongly opposed to the recognition of *foreign degrees* held by women, for on that date it addressed a letter to the Medical Council deprecating the principle of Mr. Cowper-Temple's Foreign Universities Bill, in which letter the following resolutions of the College are communicated to the Council:—

Resolved,—"That this College highly disapproves of the Bill just read (*i.e.*, Mr. Cowper-Temple's Bill to admit women to home practice upon foreign degrees) for the following reasons: 1st. That it confers upon women a privilege not possessed by men, inasmuch as, by the Medical Act of 1858, all degrees of foreign universities are excluded from the Register. 2nd. That the principle to admit women holding a foreign degree in medicine to the Register is pernicious, as it will inevitably force the Colleges of the United Kingdom to admit women to any or all their licenses, whether, in their judgment it be wise to do so or not."

That which the College denounced in such terms twelve months ago it is now doing to a certain extent itself. It cannot accept the degree of Zurich as equivalent to the whole of its license, but it takes it for one-half. That in doing so it is at variance with the opinion and policy of the Medical Council is shown by the following report adopted by it in reference to the same Bill at its last meeting:—

By the Medical Act the Council are precluded from registering foreign degrees, and consequently have been compelled repeatedly to refuse to register foreign degrees held by men.

The reason for this is obvious, viz., that the Council have no means of exercising that supervision and control over the education and examination required for foreign degrees to which the licensing bodies of this country whether universities or corporations, are by the Act of 1858 subjected. But this privilege which the Medical Act refuses to men the Bill proposes to grant to women. Against such a proposal the Council feel bound to offer a protest as being subversive of the

main principle of the Medical Act. The committee who made this report also remarked that the degree of M.D. conferred by some of the foreign universities of highest repute do not authorise its holders to practise their profession unless they shall have also passed, subsequently, and in addition the state examitation (Staats Examen).

With such expressions of opinion as these we think we are justified in protesting against the recognition of the Zurich M.D. as equivalent to any part of the *examination* of the Irish College of Physicians.

THE PROPOSED BIENNIAL PRESIDENCY OF THE IRISH COLLEGE OF SURGEONS.

THE movement to which we referred a fortnight since as being in a probatio nary stage has at length gained sufficient strength to come before the College for debate. The requisition for a special meeting of the College, which required twelve signatures, has received sixteen, and has been sent to the President, who has fixed Wednesday the 28th at twelve o'clock for the assembly of the Fellows. It was as follows :—

We, the undersigned, request that you will be pleased to call a meeting of the College at an early date for the purpose of considering the question as to whether it may be or may not be expedient that the offices of President or Vice-President should be in future held for a longer period than one year.

(Signed)

Loftie Stoney, Christopher Fleming, William Roe, J. W. Collins, Henry Tyrrell, John Hughes, T. P. Mason, Edward H. Bennett, John K. Barton, Anthony H. Corley, Robert Persse White, C. D. Purdon, H. Purdon, John R. Forrest, R. Bookey, Stewart Woodhouse.

If it was desirable to contest the question which the requisitionists desire to bring before the College upon strict points of law, we might object to this requisition that it asks the President (who is endowed by the Charter with complete discretion as to whether he will or will not comply with it) to call the College together to debate a question over which it has no control whatever, and thus it thrusts upon him the responsibility of allowing questioning at variance with the College law to be raised. As we have already said, the biennial Presidency is distinctly illegal according to the existing law of the College, and therefore, though the Fellows may discuss this or any other matter of College policy, they can only do so in full view of the illegality and with a clear anticipation of the necessity to set themselves right, subsequently by a change of Charter. Whether or not it be expedient that they shall enter on the discussion of a subject involving such a change, is for the consideration of the President, who has accepted the responsibility and called the College together.

We should regret, however, that the question of a biennial Presidency should be treated, as regards preliminary discussion, as a matter of strict law ; for, although the movement is to-day somewhat of a personal one, it is for the good of the College that it should be decisively settled, and either carried forward to the required change of system, or else scotched by a conclusive vote against it. Unsettled questions of the sort always injure the body to which they have reference, and many institutions have been deteriorated by the presence of such dissensions within them, and for want of a strong and final declaration of the views of the majority.

As to what the vote on the subject will be we entertain no doubt, if only the Fellows whose position is involved in it interest themselves sufficiently in the matter to come to the meeting and record their vote, but if the decision be left in the hands of the junior metropolitan Fellows, it is quite possible that the requisitionists would snatch a vote, which will bring the matter before the Council, backed by the authority of the College.

A glance at the signatures makes it evident that the movement has originated with that party, and that with every respect for those who have attached their names, the most influential and senior of the Fellows are standing coldly aloof from the biennial Presidency project. Amongst the sixteen names, we find but one ex-President—but one other Member or ex-Member of Council—not one Collegiate Professor—but one University Professor—and but one of the thirteen College Examiners, and none of the Provincial Fellows, who have been accustomed to show up in college politics.

But then we must not forget that the signatories are just the men who will make it their business to attend the meeting at any cost, and to put out their whole force to carry their point, and sixteen Fellows of such earnestness and energy are a strong contingent—if not in collegiate rank, at least in motive power.

We have already expressed our feeling that the proposal for a biennial Presidency is neither legal nor expedient, nor at the present juncture free from a suspicion of animus, and we need not repeat our arguments. We think it well, however, to call the attention of the Provincial Fellows of the College to the effect of such a change of law upon their hopes of collegiate distinction.

In the present state of medical competition in Ireland, the battle of life is sufficiently hot and close to make the acceptance of the Presidency of the College a heavy sacrifice and a serious responsibility to be undertaken by any Provincial Fellow. To attend the duties with anything like regularity, and to do justice to the hospitalities of the dignity for a single year, is an onerous task for any country surgeon, and the greater his practice, the more fitting he may be to receive the distinction of president, the greater the difficulty of fulfilling its duties. What provincial fellow will be found to undertake the same task for two years and to do it justice? It is impossible to hope that a member of the College so independent of business considerations and yet holding a surgical position worthy of the College chair will be found, and it is thus obvious that the biennial project, if carried, will finally extinguish the hopes of collegiate honour on the part of the provincial fellows. Earnestly desiring as we do to see its extra-metropolitan constituency tied more closely to the College than it has been, we deprecate with emphasis this or any other movement which may have the effect of cutting them off from the hope of collegiate distinctions. We look to the provincial fellows to defend their own interests by their presence and vote. If they permit temporary inconveniences to prevent their doing so, they will justify the requisitionists in ignoring their rights, as the proposal for biennial presidency undoubtedly does.

COURT APPOINTMENTS.

THE vacancy caused by the lamented death of Sir William Fergusson, Sergeant-Surgeon to the Queen has been conferred on Sir James Paget, and the appointment of Sergeant-Surgeon Extraordinary to her Majesty has been given to Mr. Prescott G. Hewett, F.R.S., President of the Royal College of Surgeons ; and Mr. J. Eric Erichsen, F.R.S., has been appointed Surgeon Extraordinary to her Majesty. These appointments will give the greatest satisfaction to the profession.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

"MEDICAL PRESS" DEFENCE FUND.

The Honorary Treasurers beg to acknowledge with thanks the following contributions to this Fund, which they have received since the publication of the last list in our columns:—

SHOCKING CRUELTY TO DUMB CREATURES.

Martha Hysterica Jones calls our attention to the subjoined description of some experiments recently performed on ants by Sir John Lubbock, and wishes to know whether we can defend "such horrible heartrending, revolting, and gratuitous cruelty wantonly inflicted upon intelligent sentient creatures." She regrets that insects not being included in the Vivisection Act the prosecution and punishment of Sir John Lubbock, which he richly deserves, cannot be effected.

"The idea that ants will take care of a distressed friend is, he believes, quite wrong. He tried just covering an ant with mould where many were passing and repassing. Not one took any notice. He then tried putting some under the influence of chloroform. These were carried away, regarded perhaps as dead. He then tried alcohol in place of chloroform. Thirty intoxicated friends and thirty intoxicated strangers were put together near a nest. The ants were at first much puzzled at the sad spectacle. However, twenty of the friends were taken into the nest, five were thrown into water, and the others neglected. Of the thirty strangers twenty-four were thrown into water, six were taken into the nest. The mistake was at once found out with regard to four of them, who were brought out and thrown into the water. Sir John said it was difficult to understand how there could be recognition in such circumstances."

Dr. Arnison.—The point raised shall be kept in mind.

Mr. George Piller.—Note and extract received.

M. A. T.—We believe an American edition has recently appeared; we have not yet seen or heard of copies in England. The original has had a great success in Germany, but it does not follow that a translation will meet with equal favour.

Clinical Society of London.—On Friday evening, at 8½, Dr. Greenfield, "On a Case of Hydatid of the Lung."—Mr. A. T. Norton, "On Ligature of Femoral Artery; Recovery; Death subsequently from Embolism of the Basilar Artery."—Mr. Godlee: "Congenital Dislocation forwards of the Knee" (a living subject).

THE NATIONAL ORTHOPÆDIC HOSPITAL.

To the Editor of the Medical Press and Circular.

Sir,—Referring to the paper read before the Surgical Society of Ireland by Mr. Robert L. Swan, F.R.C.S., and published in your issue of the 14th inst., the 7th paragraph states, "In the Royal and National Orthopædic Hospitals, except in a few cases supported by endowment, the sum of £ 0 is deposited by each applicant before admission is granted." This is incorrect as regards the National Orthopædic, no such payment or deposit being required. Although the matter may be of little moment to most of your readers it is of some importance to this Institution that such an erroneous impression should be removed, I therefore trust that you will be able to afford me space for this correction.

The total amount received from, or on behalf of, the 95 in-patients admitted here last year was £341, about £3 12s. each towards their maintenance, for which, on an average, each patient was boarded for 90 days.

Yours faithfully,

234 Great Portland Street, W. Stanford Smith, *Sec.*

Anon.—We cannot advise in such matters. Go to a competent surgeon.

Mr. F. A. Allen.—Received as we were going to press.

F. M. B.—Your communication "On Unqualified Assistants" shall appear, if possible, in our next.

Pathological Anatomy of the Brain

LOCALISATION IN CEREBRAL DISEASE. (a)

By Prof. Charcot.

Chapter XIV.

Gentlemen,—We have been considering facts in the highest degree interesting with regard to cerebral localisation. We are going to condense these facts, beginning with those which relate to the central ganglia.

A.—(a). The complete system of central arteries arising from the sylvian may be obliterated in consequence of thrombosis or embolism of the principal arterial trunk. Then softening affects the whole or part of the grey nuclei—those parts being spared which correspond to the distribution of the anterior cerebral arteries and of the optic arteries. That is a very summary case of *localisation*, and generally extremely serious, and, clinically, sums up the pathology of the ganglionary centres. The syndrome of this complete softening of the *opto striate* bodies (as these masses are sometimes called) is no other than *common cerebral hemiplegia* with *cerebral hemianæsthesia*.

(b) Analysis of this complex whole *can* be made.

Not that we are yet able to define by their symptoms, injuries of the thalamus, the nucleus, caudatus, lenticularis, or of the latter's segments.

(c) But it sometimes happens that the symptoms exactly disclose, and define the anatomical position, enabling us to make a *regional diagnosis*. These conditions are realised, when softening affects all, or nearly all, the territory either of the *lenticulo-striate* or the *lenticulo optic* arteries. We shall see in fact, that the symptoms differ in the two cases; the hemi-anæsthesia present in the second case being absent in the first.

B.—What has been said of ischemic softening, is applicable to intra-cerebral hæmorrhage. This is a common affection as you know, and especially in these regions, the striate arteries being very subject to the form of arterial sclerosis, which produces *miliary aneurisms*. One often finds in a spot of recent cerebral hæmorrhage, a striate or optic artery whose prolongations bear little aneurisms.

Though contrary to the general opinion, Cendrius' idea expressed nearly thirty years ago, is correct; viz., that the effusion of blood most frequently occurs *not* into the substance of the corpus striatum, but outside it, or exactly in contact with the outer surface of the lenticular nucleus, between it and the *external capsule* which appears as if stripped off.

Thus the flattened clots are produced, which appear on transverse section like narrow slits, almost vertical, and parallel to the grey nucleus of the front wall. When the effusion of blood is abundant, the clot increases laterally, and by reason of the greater resistance of the cranial walls, takes the direction of the Island of Reil; the central masses being so to speak, enucleated and turned back in a lump towards the ventricular cavity.

These are the most common cases, but it may also happen that an effusion starting from the terminal arteries may take place into the substance of the corpus striatum or thalamus.

Be it as it may, the only localisations of this kind clinically accessible, are here, as in the case of softening, those answering to invasion of the lenticulo-striate or lenticulo-optic region.

In the case of hæmorrhages there are difficulties in the interpretation of symptoms which do not present themselves to the same extent, in softening. If not aware of those, we shall be liable to the error of considering due to *destruction* of a part, results which are caused by injuries of *neighbouring parts*. I allude to the symptoms of compression, which soon after its occurrence, an

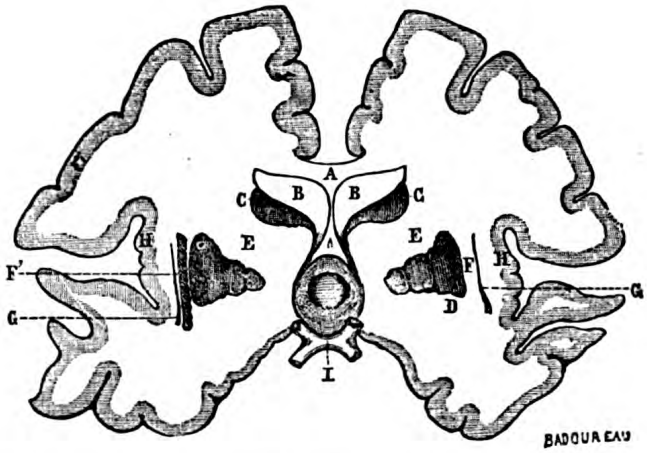
FIG. 14.



Extra-lenticular hæmorrhage section behind the commissure.—A, Corpus Callosum; B, B, Lateral Ventricle; C, C, Nucleus Caudatus; D, D, Lenticular Nucleus; E, E, Internal Capsule; F, External Capsule; F', Hæmorrhage spot which has destroyed the External Capsule; G, G, Front Wall; H, H, Insula; I, Optic Commissure.

effusion of blood never fails to produce, to a certain degree, in the adjacent parts.

I shall return to this point presently.

C.—We can sum up in a small number of propositions, the facts which have been clearly made out, relative to the regional diagnosis of the different parts comprising the ganglionic central masses.

1. As regards isolated lesions of the grey nuclei, *without any implication of the internal capsule*, we are not at present in a position to be able to recognise them by special clinical characters. Thus, it is impossible to distinguish during life, a lesion limited to the lenticular nucleus, from a circumscribed lesion in the caudate nucleus from a circumscribed lesion of the caudate nucleus or from lesions of the thalamus (through certain reservations must be made, on this latter point), they are mixed up, clinically, with those produced in the two compartments in the striate body.

The symptoms accompanying these lesions (limited to the grey nuclei) are those of common cerebral hemiplegia. This form of cerebral hemiplegia may be called *central*, to distinguish it from the motor paralyses which result sometimes from lesion of certain superficial regions, and which (by contrast) I shall call *cortical* hemiplegia.

(*b*) In most cases, the paralysis resulting from lesion of the grey central nuclei affects movement only; troubles of sensation—having the characteristics of cerebral hemianæsthesia—sometimes being superadded.

(*c*) The hemiplegia caused by circumscribed changes in the grey nuclei is usually transitory, not strongly marked, and passing off easily.

It is clear that in drawing up this proposition, I set aside every complication likely to seriously affect the set of symptoms, such as the bursting of even a small hæmorrhage into the ventricle. Grave symptoms (such as contractive power and epileptiform convulsions) will be almost sure to appear in such cases, and, more or less speedy, death is a likely result.

The mildness of symptoms which characterises limited lesions of the grey nuclei is, doubtless, partly due to the circumstance that the nuclei are seldom *wholly* damaged. For instance, owing to the distribution of its vessels, the nucleus caudatus is never wholly destroyed *by itself*—that is to say, without implication of the internal capsule of the other grey nuclei.

And another thing to be learnt from the transitory effect of partial lesions of these central ganglionic masses is that it indicates, as we shall see, the existence of a kind of supplementary function to be called into existence—either between the different parts of the caudate nucleus, or between it and the different segments of the lenticular nucleus.

On the other hand the lesions of the *internal capsule*, even when they are limited to this white tract, and are not at all combined with lesions of the substance of the grey nuclei—these lesions, I say, produce common cerebral hemiplegia, generally more or less well-marked and persistent. When circumscribed (and especially if they are very deep) in the direction of the peduncle, these lesions produce motor paralysis, almost always with slow contraction—a symptom of evil omen, because it usually implies that the paralysis will resist all therapeutic measures.

FIBROMYXOMATOUS TUMOUR OF THE LOWER JAW. (*a*)

By CHARLES P. COPPINGER, L.R.C.S.I.,
Assistant Surgeon, Mater Misericordiæ Hospital.

THE case, Sir, which I take the opportunity of bringing before the Society, is one of tumour of the lower jaw which I removed some time ago, excising at the same time the greater portion of the lower jaw itself. I hope the case will be found of some interest.

Mary Jackson, a strong healthy-looking woman, æt. 23, was sent up from the county Meath, in June 1875, and admitted to the Mater Misericordiæ Hospital. The tumour of the lower jaw from which she suffered, and on account of which she sought admission, was at this time of small size, and caused but slight deformities.

This photograph gives a fair idea of its external appearance. The jaw was somewhat enlarged on the right side by a smooth swelling extending along its outer surface, and stretching laterally from the right canine tooth to near the angle on the opposite side. The growth, elastic and as if fluctuating on pressure, closely resembled a chronic abscess, with very thickened walls. On drawing forward the lower lip, it was visible (as imperfectly shown in this

(*a*) Read before the Surgical Society of Ireland. The discussion will be found on page 165.

photograph), as a smooth, largely lobulated sub-growth, commencing above at the base of the teeth, and traceable down in front of the bone, curving round it below, and apparently encroaching on its posterior aspect. It seemed about an inch thick at its thickest part.

The history elicited from the patient was as follows :—

About two years ago she suffered severely from tooth-ache, and had a tooth extracted from the right side of the lower jaw. A short time afterwards she noticed in that situation a smooth swelling of the gum, which she thought was a gum-boil, but which had since gradually increased, and spread along the jaw to form the present tumour.

From its appearance and history, its slow growth and painless character, the absence of glandular implication or of cachexia, we concluded that it was probably a case of fibrous tumour growing from the periosteum and surrounding the bone.

It was explained to the patient that an operation for the removal of the tumour would necessarily include the excision of the lower portion of the lower jaw bone, if not the whole of it ; and after some consideration she decided on going to the country, consulting her friends, and awaiting, in the hope that its further enlargement might not occur.

For the next six months she was not heard of ; but a letter was then received from her father, explaining that she was very ill, and that the tumour had grown so as to interfere with swallowing and to prevent speech altogether. He stated that she had in the interval been admitted to another hospital, where she was told that her case was not one for operation ; and also that she was then suffering very much from melancholia and depression.

A few days afterwards she herself arrived at the hospital, her face presenting the appearance which the artist has attempted to show in the drawing.

Naturally enough, as it seemed to me, she now refused to go to a gallery for the purpose of being photographed.

The tumour had increased considerably in size, and grown forwards and upwards between the teeth and lower lip, covering and concealing the former and widely distending the lip. It was at once determined to remove the jaw from behind the left canine tooth to the angle of the opposite side, and in a few days this was done.

The patient was placed in a semi-recumbent position on the operating table. Ether was administered, and subsequently chloroform ; neither ether nor chloroform, however, caused any relaxation of the jaws, which were spasmodically closed, so that there was considerable difficulty in opening the mouth. When, however, this was accomplished by the ingenious efforts of my colleague (Dr. Cruise), the difficulties of the operation were at an end.

A bicuspid tooth on the left side was removed, a horse-shoe incision made corresponding to the lower border of the bone, the facial artery on the right side divided—a ligature being applied to both extremities—and the lip cut through in the middle line. The flaps were now directed back, and the bone sawn at either side with a small-sized metacarpal saw.

A thick ligature was then passed through the apex of the tongue, which was thus drawn forward, while the jaw-bone with tumour attached was separated from its root and the floor of the mouth by a curved knife cutting from side to side.

The divided ends of the bone were then examined, and a further piece, including the angle of the jaw on the right side, removed by means of a strong bone forceps, cutting through the vertical ramus.

The edges of the wound were carefully brought together by means of wire sutures and short hare-lip pins, to one of which the ligature in connection with the tongue was attached by a loop. This precautionary measure was continued for two days after the operation, but there was at no time any tendency apparent in the tongue to fall back.

The power of swallowing was, however, lost, and remained in complete abeyance for a fortnight, so that the patient during that period was fed entirely by means of the stomach-pump, the flexible tube of which was passed through the mouth into the stomach. This method of feeding did not seem to cause her much inconvenience. She took four times a day large quantities of beef-tea, &c., and convalesced with great rapidity.

I should mention, that about two hours after the operation, I was sent for on account of secondary hæmorrhage, and found the patient bleeding freely from the facial artery ; the silk ligature with which it was tied having been displaced, probably by some movement of the patient. I was obliged to cut through the sutures along the side of the jaw, and after turning out a large clot to retie the artery, which on this occasion I did securely with strong antiseptic catgut.

Notwithstanding this reopening of the wound, and the patient's inability to swallow, the incision healed everywhere by the first intention, and to this is, I suppose, attributable the small amount of subsequent deformity.

This drawing gives a fair idea of the appearance of the face ; there was, however, some lateral distorsion.

It is now eleven months since the operation was performed, and I lately heard from my friend Dr. Laffan, who saw the patient in the country, that there is no appearance of a return of the disease. The deformity of the face has however somewhat increased, probably from contraction of the cicatrices in the mouth, and the girl's mental condition is still unsatisfactory.

The tumour is a good specimen of a central growth distending the bone. It commenced to grow apparently from the alveolus, whence the tooth was removed two years ago, and gradually pressed out the bone so as ultimately to form for itself a sort of bony capsule. Its rapid growth for the six months preceding its removal was obviously due to the fact that it had there burst forward through its bony case.

The points of special interest in this case, and to which I would like to call the attention of the Society are—1st. The difficulty of accurate diagnosis. Although examined most carefully, and although I was of course mindful of the frequent occurrence of central morbid growths distending the jaw bone, I had no suspicion, nor had my colleagues any idea that this tumour was of that description. Its anterior wall, which was more or less exposed to examination, presented no indication of being, as we see it is, a shell of bone ; there was no resistance or pressure or crackling, such as we find over tumours of the upper jaw distending the antrum.

As regards the operation itself, the secondary hæmorrhage would not have occurred if the facial as in the case of the other arteries tied, had been ligatured with carbolised catgut and cut off short.

I have seen, as I suppose other surgeons have, many cases of secondary hæmorrhage due to displacement by a restless patient of a protruding ligature, and I do not think that this special advantage of the antiseptic ligatures has secured sufficient recognition. The good convalescence of the patient, bearing in mind that she was fed for a fortnight altogether by means of the stomach-pump, is as remarkable as was also the small amount of deformity when we consider the extent and character of the mutilation.

I have placed sections of the tumour under the microscopes for examination by the members present. The growth consists of fibrous with some mucous tissue, and is therefore a fibromyxoma.

A DISCUSSION is going on in the pages of a contemporary as to the value of a certain German table water, now being extensively advertised. On one side is the managing director of the company to which the water belongs ; on the other is a gentleman who occupies the post of chemist to a rival company. With such *disinterested* evidence the truth is sure to be arrived at.

Clinical Records.

ST. MARY'S HOSPITAL.

Twelve Cases of Rheumatic Fever treated with Salicylic Acid.

Under the care of Dr. HANDFIELD JONES, F.R.C.P., and Dr. CHEADLE, F.R.C.P.

Reported by Mr. J. SWAIN SCRIVEN, L.S.A.

CASE 1.—Female, æt. 21, domestic servant.

1st day.—Temp. 100; pulse 116. Acidi salicylic, gr. x. every hour, till sickness is induced. Stopped after eight doses.

2nd.—Temp., 9 a.m., 100·4; temp., 6 p.m., 101; temp., 10 p.m., 101·6.

3rd.—Temp, 100·8.

4th.—Temp., 100·4; pulse 104. Quiniæ sulph., gr. v., bis die.

5th.—Temp., 100; puise 96.

6th.—Temp. and pulse, normal.

History good, but patient never strong. Heart sounds clear, and no albuminuria throughout. At 11 a.m. on the second day the salicylic acid was stopped, having caused sickness after eight doses. Deafness was also caused. No medicine was then given till the fourth day, when quinine was exhibited with good results. The pains were in the back and upper extremities, and ceased on the second day, although temperature remained somewhat high. Some pains returned on the eleventh day, which were treated with line. belladonnæ c. chloroformi. Discharged cured, the twenty-first day.

CASE. 2.—Male, æt. 27, painter.

1st day.—Temp., 102·5; pulse 132. Ac. salicyl., gr xx. every hour for six hours. Temp. after six doses, 100.

2nd.—Temp., normal; pulse 120.

5th.—Potas. iodidi, gr. iii.; ferri et ammon. cit., gr. v.; t. d. s.

12th.—Pains returned. Ac. salicyl., gr. x.; t. d. s.

14th.—No pains; omit ac. salic.

Had syphilitic history; very subject to rheumatism. Salicylic acid reduced temperature and pain, but induced deafness. From second to twelfth day there were slight pains, which increased on the twelfth day, but were altogether subdued by ten grains of salicylic acid three times a day. From second to fifth day no medicine was given. Heart sounds clear, no albuminuria. Discharged cured, thirty-fourth day. Patient was a pale, fair-haired, sickly-looking man.

CASE 3.—Female, æt. 26, nursemaid.

1st day.—Temp. 102·6; pulse 108.

2nd.—Temp. 101·6; pulse 120. Ac. salicyl., gr. xx., every two hours for six doses. Temp., after six doses, 100·8; pulse 116.

3rd.—Temp., a.m., 101; pulse 116. Ac. salicyl., gr. xx.; t. d. s. Temp., p.m., 100·2; pulse 108.

4th.—Temperature normal.

6th.—No pain.

10th.—Omit ac. salicyl.

Had rheumatic fever ten years ago. No albuminuria. Heart sounds clear at first; on eleventh day first sound prolonged. Pains mostly in back and joints, greatly relieved by the first dose of the acid, which also brought down the temperature. The slightly remaining pains gradually subsided and disappeared with twenty grains of acid three times a day. Discharged cured, twentieth day.

CASE 4.—Female, æt. 25, servant.

1st day.—Temp. 100·6; pulse 104. Acidi salicylici, gr. xx., every hour for six doses.

2nd.—Temp. 99·8; pulse 88. Acidi salicyl., gr. xx.; t. d. s.

3rd.—Temperature normal; no pain.

History good. Rheumatic pains gradually increasing for a month till admitted. Temperature at once reduced and pains greatly lessened immediately, and stopped third day. Heart sounds clear. Pains in face and joints. Discharged cured, fourteenth day.

CASE 5.—Male, æt. 40, butler.

1st day.—Temp. 101; pulse 102. Ac. salicyl.; gr. xx. 2 is horis. Pains intense.

3rd.—Temp. normal.

4th.—Ac. salicyl., gr. xx. quat. die.

6th.—Pains much less.

12th.—No pains.

14th.—Temp. 100·2.

15th.—Temp. 100·4. Pains returned. Omit salicylic acid. Potas. iodidi, gr. iii., t. d. s.

20th.—Omit pot. iodidi.

16th to 28th.—Temp. varied from 100 to 103.

20th.—Salicine, gr. x. every hour for 6 doses daily.

22nd.—Omit salicine. Quiniæ sulph., gr. v., quat. die.

Has had syphilis and gonorrhœa. Formerly drank hard, and drinks freely now. Has been butler in a gentleman's household for many years. Heart feeble, but no murmur. The pains at first were intense; patient could not move in bed, nor bear to be touched. On the sixth day pains were much less, and on the twelfth they ceased. On the eighth day an attack of delirium tremens came on, which lasted more or less till the twenty-eighth day. On the fifteenth day pains returned, and at first were severe, but gradually decreased under salicine, and after under quinine, and ceased the thirty-first day, though stiffness remained till discharged on the fifty-second day, cured.

CASE 6.—Female, æt. 13. Father, brickmaker.

1st day.—Temp. 102. Ac. salicyl., gr. xv., every hour for six hours.

2nd.—Temp. 99. No pain.

3rd.—Temp. normal. Ac. salicyl., gr. xv., quat. die.

8th.—Omit ac. salicyl.

11th.—Pains returned. Temp., a.m., 99·4; temp., 2 p.m., 100·8. Salicine, gr. v. every four hours.

12th to 16th.—Pains variable, but decreasing. Temp. variable, from 99·2 to 100·6.

18th.—Temp. normal. No pain. Omit salicine.

History obscure; information not reliable. Morbus cordis. An ill-nourished frame, ill-fed, and not sufficiently clothed; feet always wet from bad shoes or none at all. No albuminuria. Pains in body and limbs. Both temp. and pain yielded at once to the acid, but pains returned and temp. went up on the eleventh day, then gradually decreased under the treatment till the eighteenth day, when the pains entirely ceased and temp. became normal. Discharged on the thirty-fourth day cured.

CASE 7.—Female, æt. 42, cook.

1st. day.—Ac. salicyl., gr. xx.; 4 tis horis.

3rd.—Temp. 101.

4th.—Temp. 102·2. No pain. Bowels confined; tongue dry, red, furred at edges. Pulse 108. Omit ac. sal.; calomel, gr. iii., aloes, gr. iv., in pil., ij.; Statim.

5th.—Temp. 102·2; pulse 96.

6th.—Bowels open. Temp. 100·2; pulse 84. No cardiac murmur.

8th.—Temp. normal.

History good, but patient weak and heart feeble. On fourth day a mitral murmur was heard, which ceased on sixth day. Pains mostly in knees were cured by fourth day. Deafness was caused, and as bowels were confined the acid was stopped fourth day. In this case the pain yielded soon to the acid, but the temperature remained high, though usually the temperature is reduced before the pains are relieved. Discharged cured, thirty-fifth day. (N.B.—Patient was kept so long because her heart was feeble, and she was very weak).

CASE 8.—Female, æt. 30, cook.

2nd day.—Temp., a.m., 101.4. Temp., 2 p.m., 102·6. Bowels confined. Mist. pot. cit. effervis, ℥j., sex. horis; calomel, gr. i.; ex. colocynth co., gr. iij.; h. n.

3rd.—Bowels still confined. Mist. alba, ℥j. Statim.

Temp. 100·4; pulse 88, weak. Mist. alba. no effect. Enema of ol. ricini.

4th.—Bowels open. Temp. 100·4; pulse 88. Omit mist. pot. cit. efferves. Ac. salicyl., gr. xx.; 4 tis horis.

5th.—Temp. 99·8.

6th.—Temp. normal.

8th.—No pain.

14th.—Omit ac. salicyl.

Had rheumatic fever fourteen years ago. No albuminuria. Pains general. Heart weak, no murmur at first; on third day mitral murmur, which ceased ninth day. Bowels obstinately confined till opened by an enema of ol. ricini on third day. Urine passed with difficulty. Pains general—began to decrease on third day, and gradually lessened till eighth day, when they ceased. Discharged twenty-seventh day cured.

(To be Continued.)

Students' Column.

LECTURES ON HUMAN ANATONY—DESCRIPTIVE AND SURGICAL.

By WALTER RIVINGTON, M.S. Lond., F.R.C.S. Eng.,
Surgeon to the London Hospital, and Lecturer on Anatomy at the London Hospital Medical College.

LECTURE XII *Concluded.*

TAKE next the SPHENOID BONE. In the adult this bone bears a striking resemblance to a bat with an extra pair of wings, but its name indicates that it is like a wedge. (*a*) It is not easy to perceive the common points of agreement between the sphenoid bone and a wedge, or between a wedge and a bat; so that possibly the name sphenoid refers rather to the position of the bone wedged in between the other cranial bones than to its actual shape. The parts corresponding to the parts in the bat are evident. The central portion is the *body*. The spreading lateral processes are the wings, and are called the *greater wings* of the sphenoid, to distinguish them from a smaller pair of processes, the *lesser wings* or *processes* of *Ingrassias* which jut out from the anterior part of the body. Projecting downwards on each side from the junction of the greater wings with the body, are 2 processes representing the legs, united in front, but separated behind, and called the *pterygoid processes, internal* and *external*. Curiously the term pterygoid means wing-like, and not leg-like; (*b*) the comparison to the bat not being carried out consistently in the nomenclature. The space which the pterygoid processes form behind is called the *pterygoid fossa*. The body of the sphenoid is hollowed out anteriorly into 2 cavities, called the sphenoidal sinuses, which underlie a depression on the upper aspect, called the *sella turcica* or *pituitary fossa*, because it lodges a portion of the brain of great morphological but slight physiological importance, the *pituitary body*. The sphenoidal sinuses are bounded in front and below by two small ossicles, shaped "like sugar bags" (to use the comparison of Huxley), with their wide and open ends directed forward, and their apices backwards. These ossicles are called the *sphenoidal spongy bones, cornua sphenoidalia*, or *bones of Bertin*.

Behind the sella turcica is a plate called the *dorsum sellæ* or *basilar plate*, and it bears at the ends of its upper border little tubercles called the *posterior clinoid processes* (*c*), from some resemblance to bedposts. In front of and opposite to them, and connected with the hinder border of the lesser wings, are tubercles which are called the *anterior clinoid processes*. The sphenoid bone, by means of the greater wings, forms the larger part of the middle fossæ of the skull, and stretching across the skull, bounds each orbit at the outer side, whilst contributing at the same time to the large fossæ behind and outside the orbits called the *temporal fossæ*, and to smaller fossæ below the temporal fossæ and zygoma, called the *zygomatic fossæ*.

By means of the pterygoid processes, it helps to bound the hinder openings of the nasal fossæ, and is clamped to the upper jaw bones through the inter-position of the palate bones.

(*a*) σφὴν, a wedge, and εἶδος, form.
(*b*) πτέρυξ, a wing, and εἶδος, form.
(*c*) κλινη, a bed.

The sphenoid is distinguished by the important *foramina* which it contains, giving exit to nerves and blood-vessels. These foramina, or holes, are the *optic*, the *anterior lacerated*, the *vidian*, the *round*, the *oval*, the *spinous*, and *vesalian*. At birth, as you perceive, the sphenoid bone consists of these 3 pieces. In the centre is the body joined to the processes of Ingrassias, bearing a marked resemblance to a dove with expanded wings, and on each side are the greater wings and pterygoid processes united. At an earlier period the body of the bone was divided into two parts, an anterior and posterior. The two pieces united about the seventh or eighth month, the line of union being "indicated for some time by a hole filled with cartilage round above, and opening inferiorly into a wide notch." (Quain). In scientific nomenclature, these two parts of the body of the sphenoid are termed the *pre-sphenoid* and the *basi-sphenoid*. The greater wings are called the *ali-sphenoids*, and the lesser wings the *orbito-sphenoids*, for they help to roof in the cavity of the orbit. The *external pterygoid plates* or *processes* are mere apophyses from the greater wings, but the *internal pterygoids*, though joined at birth to these two parts, are developed from separate nuclei, and represent distinct bones, the *pterygoid* bones of lower animals. The fœtal bone is not hollowed out like the adult bone, for the sphenoidal sinuses are not developed for many years after birth, but the spongy bones are represented in this specimen at least by separate little bony nodules. The PARIETAL BONES, with their 2 surfaces, four borders, and four angles, are extremly simple. On the outer side is the prominence called the *parietal eminence*, or protuberance corresponding with the point at which ossification commenced. The quadri-lateral shape of the bone in the adult presents a contrast to the rounded fœtal bone. In the latter the parietal eminence is more prominent, and differs from the same part in the adult, in being the thickest instead of the thinnest part of the bone. The adult FRONTAL BONE presents an upper and larger part, an expanded plain curvilinear plate, which is called the *frontal plate* or *vertical plate*, and protects the anterior part of the brain; and a lower and smaller part, divided by a notch into two very thin dome-like plates, which, roofing the orbits, are termed the *orbital plates*. The notch or interval between the plates is for the reception of the ethmoid, and is known as the *ethmoidal notch, or incisura ethmoidalis*. The orbital plates are united to the vertical plate by their anterior edges, and the line of junction is represented anteriorly by the upper margin of the orbit, or *supra-orbital arch*. The outer aspect of the vertical plate presents two rounded eminences, called the *frontal eminences*, exactly similar to the parietal. At birth the Frontal Bone is in two separate lateral halves, each formed from its own nucleus. The frontal eminences being the spots at which ossification commenced, are the thickest parts of the bones, whilst in the adult they are thinner than other parts of the vertical plate. Hollowing out the adult bone at the lower part of the vertical portion between the orbits, and above them, are the cavities called the *frontal sinuses*. Like the sphenoidal sinuses, they are not to be found in the fœtal bones. The ETHMOID, or *olfactory capsule*, is divisible into a *horizontal plate* known as the *cribriform*, from the perforations for the olfactory filaments, twenty on each side—a *vertical* or *perpendicular plate*, the upper part of which appears in the anterior fossa of the skull as the *cristu gulli*, and the lower or larger part in the nose assisting to form the *septum nasi*—and two lateral portions, or *lateral masses*, suspended as it were from the shoulders of the cribriform plates, more or less after the manner of milk-pails. In botanical language, the lateral mass is *sessile*, while the milk-pail is *pedunculated*. The *lateral masses* are again divisible into two *spongy* or *turbinated bones* — the *Ethmo-turbinals*, which are clothed with mucous membrane, to which the olfactory filaments are distributed. These bones lie at the upper part of the nasal cavity or nasal fossæ on each side, which is the region devoted to the olfactory sense. The whole of the lateral masses are composed of little cavities or air cells, which communicate with the nasal fossæ. The outer walls of these cells is a thin plate of compact bone, the *os planum*, which forms the main part of the inner wall of the orbit. At birth the Ethmoid consists of two osseous masses, not hollowed into cells, but corresponding to the lateral masses, the horizontal and perpendicular plates being still cartilaginous.

The main divisions of the TEMPORAL BONES are the *squamous*, the *zygomatic*, the *mastoid*, the *petrous*, *tympanic*, and *styloid*. The *squamous* portion, or *squamosal*, is the thin plate which overlaps the parietal at the side of the skull, and bears

the process called the *zygoma*, by which the temporal joins the malar. Underneath it presents the *glenoid fossa* for articulation with the lower jaw. (*a*) Between the *squamosal* and the *mastoid* is the orifice of the external passage of the ear. The process descending behind the orifice of the ear is the *mastoid process* (*b*), so called from its shape, which is the shape of a nipple. It is in serial line with the transverse processes of the vertebræ. Jutting into the skull, between the squamous and mastoid portions, is the true bony case for the organ of hearing—the *petrosal* or *petrous portion, pars petrosa*. Triangular and wedgy-shaped, its apex abuts against the sphenoid, its base is inserted between the mastoid and squamous divisions of the bones, and two of its three sides, anterior and posterior, appear in the cavity of the skull, the third or inferior lying at the base. Of the three borders the superior is a conspicuous eminence in the interior of the skull. Bounding the outer passage of the ear, anteriorly and inferiorly, is a plate of bone known generally as the *auditory process*, but better styled the *tympanic bone*, as it attaches the *tympanic membrane*, which separates the external passage from the middle division of the ear or *tympanum*. The long process which descends from the petrous portion *surrounded* at its base by a prolongation of the tympanic bone, called the vaginal process, is the *styloid process*. The other more conspicuous objects, in the petrous portion of the bone, are the aperture on the posterior surface for the auditory and the facial nerves, the *internal auditory foramen;* the bent canal, which opens both at the apex, and on the under surface for the internal carotid artery, the *carotid canal;* and a depression outside and behind it for the large internal jugular vein. At this spot the temporal unites with the occipital to form the *posterior lacerated foramen* already noticed. At birth the temporal bone consists of two or three parts; the squamosal and zygoma are joined to form one part—the petrous and mastoid to form a second—the auditory process, an incomplete ring or hoop of bone, open above for the membrane tympani, is the third, but the tympanic is often united by its extremities to the squamosal. The styloid process is still cartilaginous. The petrous and mastoid portions of the Temporal Bone are formed from three chief ossific centres, named the *Prootic*, the *Epiotic*, and the *Opisthotic*, which together constitute the bony case for the auditory organ, or the *periotic* capsule.

The SUPERIOR MAXILLARY BONES have marked features. The main part, or *body*, is hollowed out into a great cavity, the *Antrum* of *Highmore*, or *maxillary sinus*, which lies beneath a thin plate of bone, forming the floor of the orbit, above the outer or hinder portion of the curved process, called the *alveolar* process, which bears the sockets for the bicuspid and molar teeth, outside a thin, imperfect plate of bone forming the outer wall of the nasal fossa, behind the plate of bone which intervenes between it and the soft structures forming part of the cheek, and in front of the rounded posterior surface. Separating the surfaces of the body is a process known as the *malar process*, for junction with the malar bone; rising upwards is the *nasal process*, part of the fundamental osseous framework of the nose; passing inwards is the *palatine plate*, incomplete behind, to form part of the floor of the nose and the roof of the mouth. A cavernous body with three surfaces and four processes is the superior maxillary bone. Conspicuous on the anterior surface is the hole below the orbit, called the *infra-orbital foramen*, and conspicuous on the inner surface are the ragged orifice of the antrum and the moiety of the *nasal duct* for the passage of the tears into the nose which lies behind the nasal process.

All the parts of the maxilla are recognisable at birth. At this period it may be observed that the part of the alveolar process bearing the incisor teeth, with a small triangular slip of the palatine process behind it, shows some evidence of having been originally a separate ossification. A fissure may be found running backwards and inwards from the interval between the canine and outer incisor and across the alveolar and palatine processes to a foramen called the anterior incisor foramen, which lies behind the inner incisor. This part of the maxilla is known as the PREMAXILLA, PREMAXILLARY, or INTERMAXILLARY bone. It is well seen as a separate bone in lower animals, as exemplified in this tiger's skull. The two premaxillæ are seen to bound the anterior opening of the nose, but the antrum is a mere dimple on the inner wall, and the alveolar process is a shell consisting of two thin plates imperfectly divided by slender septa into *alveoli*, or sockets for the teeth.

The PALATE is distinguished by its resemblance to a capital L. It consists of two plates, a *horizontal* or *palatine*, which unites with its fellow to complete the partition between the mouth and nose where the corresponding process of the superior maxillaries are deficient, and a *vertical plate* which bears at its summit two processes, the *orbital* and *sphenoidal*, separated by a notch or incomplete *foramen*, the *spheno-palatine*. These two plates join each other at a right angle, and prolonged downwards from the posterior edge of the vertical plate, is a rough pyramidal process, the *tuberosity*, which fits in between the divergent ends of the pterygoid processes of the sphenoid. At birth the palate bone is small, but its several parts are distinct.

The VOMER is a thin bone, with two surfaces and four borders attached above to the sphenoid, and below fitting in between the palatine processes of the superior maxillary and palate bones. It helps to form the septum nasi. It is in reality composed of two plates of bone united together, as is well indicated in the fœtal bone by the deep groove on the anterior border which separates them from each other.

The INFERIOR TURBINATED BONES are in the form of a scroll, and hang on by a depending leaf-like process to the cavity of the antrum. In the fœtal bone all the parts and processes of the adult bone are recognisable.

The NASAL BONES, with two surfaces and four borders, elongated, narrow, and stout form the bridge of the nose. They are grooved internally for the nasal nerve. The delicate LACHRYMAL, quadrilateral in shape, are chiefly distinguished by the ridge and groove on the outer aspect for the completion with the superior maxillary of the *lachrymal sac* and *nasal duct*. The MALAR BONES are more irregularly quadrilateral, having a body with four prominent angles, and bearing a process which projects to form part of the floor and outer wall of the orbit. It is remarkable for its strength, the obliquity of its position, and the efficient manner in which it clamps the temporal and frontal to the superior maxillary, thus serving as a bond of connection between the cranium and the face, and justifying the synonym *jugal* bone. With the zygoma it forms a narrow bridge over the temporal fossa. There is no special feature to be noticed in the fœtal nasals, lachrymals, and malars.

The LOWER JAW BONE forms a horizontal arch, suspended, by two vertical branches which join it at right angles, from the temporal bones. The arched middle portion is called the *body*, the vertical branches the *rami*. The body carries, above, the *alveolar process* with sockets for the teeth, and, below, ends in a thick border, the central part of which is everted to form the osseous basis of the *chin*. Each ramus bears two processes on the upper border; behind, the articular process or *condyle*, which plays in the glenoid cavity of the temporal; in front the triangular apophysis called the *coronoid process* (*c*); the condyle and coronoid process by a notch called the *sigmoid* (*f*) *notch*. The junction of the posterior border of the ramus with the lower border forms the *angle*. Body, rami, condyle, coronoid, and alveolar processes, angle and mental process or chin, are the main parts of the lower jaw. At birth the bone is in two equal halves, united by fibrous tissue. The two pieces become joined in the first year, and the place of junction is termed the *symphysis*. This completes our preliminary sketch of the separate bones of the skull, as well as the present lecture.

(*a*) γληνη, a shallow pit.
(*b*) μαστος, a teat or nipple.

Transactions of Societies.

THE PATHOLOGICAL SOCIETY OF LONDON.

THE last ordinary meeting of this Society was the third evening devoted to the exhibition of specimens of visceral syphilis.

After the President had exhibited for Dr. Aitkin a series of specimens from the Museum of the Royal Victoria Hospital, Netley, Dr. Turner showed for Dr. Sutton several drawings illustrative of the subject under discussion. One was a specimen of syphiloma of the brain springing from the inner side of the parietal bone and invading the cortical substance of the brain. The case was that of a young woman 26 years old, who, ten years ago and six months after her marriage, had suffered from sore-throat and enlarged cervical glands, but no

rash. The symptoms were, headache, vomiting, loss of sight in the left eye, a blurred appearance of the optic discs, some paralysis of the left third and right sixth nerve, and, finally, convulsions and coma. After death there was found a node on left parietal bone, adhesion of the dura mater to the brain in the left hemisphere, the presence of a greyish material around the optic, left third, and right sixth nerves, puckering of the surface of the liver, and thickening of its capsule. Also drawings of aorta, lungs, and testis from a case of congenital syphilis in a lad 14 years old, whose teeth were notched and his forehead prominent. The glands in the posterior mediastinum were enlarged, there were circumscribed nodulations on the coat of the aorta originating in its deeper layers, and a fibrous condition of the testis.

Dr. GREEN showed a specimen of "Syphilitic Disease of the Lung" from a young man who had also a well marked gumma of the liver. The lower lobe of the lung was occupied by a mass of induration of the size of a small orange, passing gradually into the surrounding tissue, of a greyish-red colour and fibrous structure. The microscopical sections presented the ordinary appearance of syphilitic growths, and the new small-celled structure appeared to originate around the interlobular vessels and thence to invade the walls of the alveoli. Dr. Greene thought that in determining the syphilitic nature of these indurated lungs naked eye appearances should have more weight than histological characters, as histologically they were indistinguishable from other forms of pulmonary fibroid indurations, such as chronic phthisis, chronic pneumonia, &c. But he made an exception to the endarterial changes described by Drs. Heubner and Greenfield. It was also his opinion that the syphilitic growth was interlobular and periosterial rather than peribronchial, whereas, in chronic phthisis and pneumonia the change is first in the alveolar walls and smaller bronchi. Moreover, in exceptional circumstances, constitutional syphilis gives rise to gummata in the lungs and may arise from the same cause and may end in ulceration and gangrene.

Dr. PYE-SMITH showed several specimens from a case of "Tertiary Syphilis," which illustrated a large number of visceral changes. The patient, a man, 42 years of age, had suffered for more than two years from symptoms of chronic phthisis, and shortly before his death, which was sudden and occasioned by coma and convulsions, one of his arms had to be amputated for necrosis of the ulna following upon an abscess in the forearm. The *post-mortem* examination showed a large amount of visceral syphilis but no tubercular lesions. There was caries of the frontal bone to which the dura mater was adherent, a single fibrous nodule in the right lung, more or less grey and firm, consolidation of the left lung traversed by dilated tubes, contraction of right and left bronchi, condyloma of the dura mater, a thickening of the capsule of the spleen and shaggy opaque condition of the capsule of the liver, and a fibroid state of the testes. In the course of his remarks, Dr. Pye-Smith said, that in this case the absence of tubercles, caseous change, softening and cheesy glands, and microscopically of alveoli stuffed with catarrhal cells, and peribronchial tubercles formed a marked distinction between this syphilitic disease and ordinary phthisis. As a peculiarity of syphilitic lesions in the lung he also adverted to the associated changes in other viscera, the reaction to treatment, and the chronic interstitial pneumonia, with fibroid induration and bronchiectasis of irregular local distribution. The contraction of the bronchi was also very characteristic of syphilis.

Dr. DOUGLAS POWELL showed for Dr. Shepherd a specimen of "Syphilitic Disease of the Lung," the clinical history of which was that of fibroid phthisis. The *post-mortem* examination showed induration of the parenchyma with dilatation of the bronchi, obliteration of the alveoli from thickening of their walls, but no miliary tubercle or grey granulation.

During the discussion that followed, Dr. Drysdale said, that Ricord lectured on syphilitic phthisis in 1845. He thought that the specimens proved that gummatous tumours in the lungs might soften and lead to excavation. He cited two cases which appeared to corroborate this view, and he further stated his belief in the existence of a true syphilitic phthisis.

Dr. WILSON FOX said, his knowledge of demonstrable syphilitic disease of the lung was limited to two cases of gummata. He would, however, urge much caution in the recognition of syphilis as a prominent cause of phthisis. He knew of five different forms of lung disease which had been described as indubitably syphilitic, and during the discussion nearly as many varieties of destruction of the lung had also been imputed to syphilis. Attention was drawn to the fact that in the Army Medical Reports, pulmonary gummata played a large part in the returns of phthisis. On the other hand, in Dr. Goodheart's statement of 147 cases of visceral syphilis, in not one is there any mention made of gummata in the lung. He, therefore, submitted whether the same things were not being called by different names, else how can the great difference between the records of military and civil hospitals be accounted for. With regard to the fibroid changes described by Drs. Goodhart, Green, and Pye-Smith, he thought that beyond a larger portion of the interstitial growth than was met with in ordinary phthisis, no distinction could be made between the two kinds of affection. He doubted the specific character of these indurations, especially as Wagner says that the growth in syphilis occurs in the alveolar walls, while Virchow describes it as existing in the form of peribronchial nodules. Dr. Fox estimated about 15 per cent. of his own cases of chronic phthisis to have occurred in the subjects of syphilis, but he had not been able to draw any distinction between the fibroid indurations in those cases and those which were found in the others. Indeed, syphilis appeared to have little effect in modifying or producing the pulmonary changes. It might, however, produce a specific form of pneumonia, which might become chronic. He doubted, too, whether much was gained by treating specifically phthisical patients with a syphilitic history, and if that be true, the history of "syphilitic phthisis" differed materially from syphilitic lesions of this part. The only definite lesions are the gumma, and that seldom leads to destructive disease of the lung.

Dr. PAYNE thought that there was more in the subject than Dr. Fox supposed, and he believed that the lung presented in syphilis as distinctive lesions as the liver does. The peculiar characters of syphilitic disease of the lung were limited masses of inflamed tissue, tending to consolidation. The inflammation was sometimes interstitial, sometimes alveolar, most frequently both; and the tendency of the lesion was to degeneration and fibroid changes.

Dr. GOWER showed part of a brain, spinal cord, and testicle exhibiting syphilitic growths, and which illustrated two methods by which syphilis caused paralysis; namely, by growths and by indurations around nerves. There was an old gumma in the position of the infundibulum, and a recent growth in the left crus extending to the base of the optic thalamus; also two recent growths in the lower cervical region of the cord, one of which was of considerable size. There were thickenings around the left five nerve roots, and ganglion, which with the three, four, and six, was enclosed in indurations connected with an adherent dura mater.

Dr. MAHOMED showed a specimen of aneurism of the thoracic aorta, from a syphilitic patient. He also quoted several statistics drawn from the *post-mortem* records of Guy's Hospital, showing the greater frequency with which aneurism and atheroma occurred in the subjects of syphilis than in non-syphilitics.

SURGICAL SOCIETY OF IRELAND.

A MEETING of this Society was held on Friday, Feb. 2, 1877, the Vice-President of the College, Dr. ROBERT MCDONNELL, in the Chair.

Mr. COPPINGER read a paper on

A FIBRO-MYXOMATOUS TUMOUR OF THE LOWER JAW,

which will be found on page 160.

The VICE-PRESIDENT said, that there was one practical point in this case to which he should like to refer. In the cases he had seen in which the incision was made through the middle of the lower lip in the progress of recovery, the lip assumed a spout-like shape, and there was a tendency for fluid to dribble over it. In the last case he operated upon he preferred to make the incision from the corner of the mouth which gave a great deal of room, and, on the whole, he thought, a better lip, subsequently. He wished to ask Dr. Coppinger was there a tendency in his case to that spout-like condition of the lower lip? He also wished to know if there was any hæmorrhage from the bone? In the last case upon which he (the Vice-President) operated he was warned by Dr. Corley, who told him of a case in which there was rather troublesome hæmorrhage from the bone. He (Dr. McDonnell) was therefore prepared with wooden pegs to put into the dental

canal. In that case he had hæmorrhage, but he was able satisfactorily to control it by means of the pegs.

Mr. CORLEY said, that the case to which the Vice-President had alluded was not his (Mr. Corley's) case, but one of Dr. Stapleton's. That gentleman prepared himself with pared matches having silk ligatures attached to them, and by that means troublesome hæmorrhage was stopped. The ligatures attached to the pegs were used to draw them out as soon as they got a little loose. In that case of Mr. Stapleton's the hæmorrhage was stopped with the pegs after the cautery had been tried once or twice without effect.

Dr. HENRY KENNEDY called attention to the fact that a London surgeon, Mr. Maunder he believed, had published the particulars of a case of operation on the lower jaw, in which he had not occasion to touch the cheek. He (Dr. Kennedy) could not give the particulars of the case, except that it was a case of operation on the lower jaw. Mr. Coppinger's case, he took it was one of those cases which the late Mr. Cusack operated so frequently and with such success, and in which there never was a return of the disease afterwards.

Mr. COPPINGER, in reply, said, with reference to the remarks of the Vice-President, that he had received a letter from Dr. Laffan regarding the patient after her return to the country, and he stated that the deformity of the face had considerably increased, and that the lower lip had shown a tendency to droop forward and assume that spout-like appearance to which Dr. McDonnell had referred. There was also some lateral distortion of the face. He (Mr. Coppinger) knew of Mr. Maunder's system of operating without a division of the lip, but he (Mr. Coppinger) did not like, in the case now before the Society, to dispense with the division of the lip, as he thought the danger of hæmorrhage would be less, and the girl's mental condition was such that he was afraid secondary hæmorrhage would give considerable trouble. It was apparently a very suitable case for the operation of simply increasing the commissures of the mouth by incision on either side and pressing back the lower lip. If he had another case he would operate in that way, so as to avoid the deformity caused by the central incision. He had examined the tumour, and it proved to be a good specimen of fibro-myxoma, sections of which were under the microscopes on the table.

The Death-Rate of 1876.—In the United Kingdom 1,154,627 births and 676,928 deaths were registered during the year 1876, equal to a birth-rate of 34·8 and a death-rate of 20·4 per 1,000 persons estimated to be living in the middle of the year. The *natural* increase of population, by excess of births over deaths, was therefore 477,699 and 91,715 more than that in the previous year. The *actual* increase depends also upon the balance between immigration and emigration, and no complete record of immigration exists. The 510,308 deaths in England and Wales included 129,537 of infants under one year of age, and 124,059 of persons aged upwards of sixty years. The rate of infant mortality measured by the proportion of deaths under one year to births was 146 per 1,000, against 149, 151, and 158 in the three preceding years, and was lower than in any year since 1862. The rate of mortality among persons aged upwards of sixty years was 68·3 per 1,000 persons estimated to be living at those ages, against 72·0 and 77·5 in 1874 and 1875. The deaths registered in England and Wales from all causes during the year included 73,217 which were referred to the seven principal zymotic diseases, showing a decline of 6,042 from those referred to the same causes in 1875. These 73,217 deaths included 2,418 from small-pox, 9,551 from measles, 16,643 from scarlet fever, 2,822 from diphtheria, 9,884 from whooping-cough, 10,372 from fever, and 21,527 from diarrhœa. The rate of mortality from these seven diseases was equal to 3·0 per 1,000, against 3·8, 2·9, 3·6, and 3·3 in the four preceding years. The fatal cases of small-pox and measles were more numerous in 1876 than in 1875, whereas those of each of the five other diseases had declined. The steady decline in the fatal prevalence of fever (including typhus, enteric, and simple fevers) affords the most satisfactory evidence of sanitary progress.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, FEBRUARY 28, 1877.

VISCERAL SYPHILIS.—I.

IT must be admitted that the proceedings at the last three meetings of the Pathological Society have inaugurated a new era in its history, and that in future the exhibition of specimens as well as the discussions, will be conducted on a better system than that hitherto pursued. It has been too much the habit of the Society to introduce a multitude of morbid specimens, differing little, if at all, from others recently exhibited and recorded; while at the same time, too little attention has been given to the history, symptoms, and diagnosis, of the cases which furnished the specimens. Hence the Society appeared to be established more for the prosecution of morbid anatomy than of pathology, properly so-called, for the mere record of the ravages left by disease, and not for the investigation of the causes and nature of the disease itself, or for showing the bearing which the cases brought forward would have upon the diagnosis and prognosis of others that might occur in practice. Now, we cannot say that the Society intends to fully carry out the principles involved in the last observation, but they have certainly taken one step in the right direction. They are, as the President, Dr. Murchison, recently announced, making an attempt to classify certain of the specimens, by setting apart special meetings for the purpose of bringing together from different sources a number of examples of the same class of pathological lesions, so as to facilitate comparison, and elicit remarks from those who have paid particular attention to the subject in question.

The first experiment of the sort has just been made, and is embodied in the recent meetings of the Society on the subject of visceral syphilis, a subject upon which much light has been thrown by Dr. Wilks and other members of the Society. Until within a comparatively recent period, our knowledge of the secondary and tertiary

effects of syphilis was chiefly limited to syphilitic affections of the skin, mucous membranes, and the bones, little or nothing being known about the disease as affecting internal organs. Now, we often talk of gummata in this or in that organ, of syphilitic disease of the arteries, of paralytic affections arising from syphilitic tumour of the brain, and so on. The subject, too, is one of immense importance from a moral as well as from a physical point of view. It is perhaps as well that fresh terrors should be added to a disease which depends for its sustenance upon the immorality of mankind, which is more frequently acquired than inherited, and the prevention of which is more than any other disease under the control of the individual.

The specimens that have been brought forward at the Society's meetings have been chiefly confined to the lesions of the brain and its membranes, the cerebral arteries, and the lungs.

Of those, syphilitic lesions of the *arteries* deserve especial attention, considering that upon them many other lesions depend. Of the *post-mortems* on twenty-two cases of visceral syphilis, which Dr. Greenfield made at St. Thomas's Hospital, during the past two years, a considerable number showed more or less marked atheromatous changes in the aorta and other arteries. Of five females who died under twenty-five, two died from thrombosis of these vessels. Indeed, of the fifteen who died from the effects of syphilis, in no less than five cases (chiefly females) there was thrombosis of the cerebral arteries, and one of the pulmonary artery. Very marked atheroma of the aorta was found in a female twenty-three, and in two twenty-five years old. In one of them the atheroma was general; in another very marked everywhere. With regard to the general appearances presented by disease of the smaller arteries, some resembled a whitish fibrous cord, or a piece of white thread, or had a "semi-cartilaginous" hardness and consistence, or were irregularly thickened and nodulated, or were the seat of a distinct nodular growth. A section would in some cases show that the walls of the artery were greatly thickened, and its channel remarkably contracted, or even obliterated, or plugged to a considerable extent, or, as in Dr. Davidson's case, apparently the seat of an organised thrombus. The relative extent to which the several coats were involved appeared to differ in most instances. Sometimes the middle coat was but slightly affected, whilst the inner would be greatly thickened, and form a mass which nearly occluded the vessel. At other times the thickening would appear to involve all the coats, the inner one, however, probably being the one mainly involved. The outer coat was also frequently thickened, while sometimes there was infiltration and thickening of the adventitia, disposed unequally around the vessel (Davidson). Coming now to the microscopical appearances of the diseased artery, it would seem that the morbid structure varied chiefly with respect to its seat, and the stage of its growth. In one specimen (exhibited by Dr. Greenfield) the outer coat was infiltrated with a cellular growth, especially marked around the vasa vasorum, while the inner coat resembled that of a fully developed gummatous growth, with capillaries of new formation, running through it, showing a tendency to organisation, and the whole separated from the blood channel by a distinct endothelial layer. In another specimen (one of Dr. Gower's) a nodule, consisting of a small-celled growth, varied in places by fusiform cells, and a delicate fibrillar stroma, was seated outside the vessel, and appeared to take its rise in the outer coat; whilst the cavity was occupied by a mass formed of cells similar to those in the outer wall of the vessel, the growth having penetrated all the coats. Then, again, in the specimen of a diseased basilar artery of which Mr. Herbert Sankey made a careful microscopical examination, the adventitia was replaced by a growth of small, nucleated, fusiform, and spherical cells, about the 1-1300th of an inch in diameter. The muscular and elastic coats were little changed, but the endothelium was replaced by a growth of fibrous tissue and spindle cells, abundantly traversed by thin-walled capillaries, and the lumen of the vessel was filled with thrombi of different dates (Buzzard). In Dr. Davidson's specimens, also, there was infiltration of the adventitia, with a small round-celled growth, disposed unequally around the vessel; and an organised fibro-cellular and vascular structure lining the interior of the artery.

It would appear, therefore, as Dr. Greenfield observed, that the different specimens brought forward presented similar characters, though the stages and situations of the disease were different in several cases; but there was some conflict of opinion as to the nature of the changes in the inner coat of the blood vessels. In the opinion of some they resembled atheroma, or were due to organisation of a peripheral thrombus, while others thought that they arose by a peculiar growth from the endothelium, and the interlaminar cells of the intima, producing a vascular structure, corresponding with other syphilitic new growths; in short, a form of syphilitic endarteritis.

According to Dr. Gowers, Heubner, who has written a monograph on the subject, disclaimed any idea of their being any specific character in the structure of the growth itself. The description, said Dr. Gowers, given by Heubner of syphilitic arteritis, is precisely the same as that given by Wilks and Moxon, of "semi-cartilaginous thickening of arteries;" but the latter believed that the condition which they described was in no way connected with syphilis. It would seem, added Dr. Gowers, that the influence of the syphilitic dyscrasia was shown more in the degree to which the change was carried, than in the kind of change; and he thought that more significance was to be attached to the nodular thickenings of the outer wall than to the endarterial changes. On this question, however, of the specific or non-specific nature of the arterial lesions we shall have something to say hereafter, but before dismissing this part of the subject, we may observe that, whether these lesions occurred independently of syphilis or not, the history of the specimens brought forward showed, from a clinical point of view, the serious consequences resulting from them. We have already mentioned that of Dr. Greenfield's twenty-one cases, fifteen are said to have died from the effects of syphilis; and of this number no less than five died from thrombosis of the cerebral arteries. In one of Dr. Buzzard's cases the patient, who had contracted syphilis twenty years previously, died of coma, preceded by paralysis, diplopia, and

strabismus; and after death there was found advanced disease of the basilar artery, with softening of the pons varolii and superficial layers of the crura cerebri. In another case that of a sailor, who had contracted syphilis seven years previously, death was preceded by severe headache, partial left hemiplegia, and palsy of the right third nerve, and a *post-mortem* examination revealed disease of the arteries at the base of the brain, with a small hæmorrhage in the right crus cerebri. It is also the opinion of Dr. Greenfield that a similar diseased condition of the small vessels played an important part in the degeneration of gummata. He thinks that the sudden decadence of these growths, after they had attained to a high degree of organisation, was to be accounted for by the partial occlusion of some of the small arteries and capillaries by proliferation of their endothelium.

THE PERIOD OF MEETING OF THE MEDICAL COUNCIL.

In our last issue we referred to a reported determination of the President of the Medical Council to fix its meeting late in the month of May, a date at which any expression of opinion by it as to the medical questions of the day and upon current legislation would be useless and ridiculous. We urged the President with all vehemence, to call the Council in the early part of the session, and not to disappoint the hopes of the profession by another assembly of talk and inaction, and we are gratified to learn that our view has been unanimously confirmed by the Irish Branch Council, who have forwarded a resolution to the President, advising that the General Council shall be summoned for March, or early in April. We suspect that the decision of Dr. Acland, is mainly ruled by the objections to an early sitting raised by the Scotch representatives. These gentlemen are, for obvious reasons, in favour of any or everything which will defer reform, and if they could prevent a meeting would doubtless do so. As they cannot, they are believed to exercise all their influence to adjourn the assembly until a time when it is too late to effect either good or harm. If the President yields to such representatives, we hope the matter will be taken up by the independent members in the Council, and a strong protest made against the policy of inaction which a late meeting is calculated to serve.

THE LECTURE CERTIFICATE SYSTEM IN IRELAND.

We learn that the Board of Trinity College has taken a decisive step towards breaking up the system of certificates which testify to diligent attendance on lectures of persons who made no such attendance at all.

Against the continuance of this system the University of Dublin had long since shown its feeling, inasmuch as it has for some years required from the candidates for its medical and surgical degrees coming from extra-collegiate schools a personal certificate of the lecturer that the student had attended three-fourths of the course in addition to the usual certificate which passes current with other licensing bodies. Early last year the medical registrar of the School of Physic, Professor Haughton, rejected the certificate of a student from "The Ledwich" School on the ground that this requirement was not honestly complied with, the lecturer whose business it was to testify to the three-fourths attendance having refused to guarantee the presence of the student at his lectures without a regular roll-call.

A similar case having now come to the notice of the Board of Trinity College, it has resolved that the certificates of that school be no longer received for the University degrees, and, should the decision of the Board be confirmed by the University Council, the Ledwich School will be finally disfranchised as far as Trinity College is concerned. This decision, however powerful it might be as a protest against the system which, we hope we may say, is now passing out of existence, will have little direct effect upon the School, because it is a most unusual occurrence for one of its student to go to the University for a degree. If, as we hear, the resolution of the Board be communicated to the Council of the College of Surgeons and to the Fellows of the College of Physicians, those august bodies will be placed in the dilemma either of refusing the patronage of a very valuable feeder to their examinations, or else of continuing to accept certificates which have—not more in Ledwich than in other schools—been long known to be a sham, and which are now formally denounced as such by the highest authority on such subjects in Ireland. It is hardly necessary to say that any movement having for its object to secure *bonâ fides* in the medical study of the profession, to substitute genuine teaching for imaginary courses of lectures, to emancipate the students from paying for what they don't want and don't receive, and to compel them to use their eyes and fingers in hospital and dissecting room has our entire sympathy and highest approval, and such a movement is fittingly led by the governing body of the old Irish University. Probably the Board will meet with little encouragement and co-operation from the administration of the licensing bodies, but they may feel assured that public and professional opinion is not only with them, but is indignant at the long continuance of the system under which medical education groans.

We are not at all prepared to say that the Ledwich School is in any respect a greater sinner than other Irish teaching establishments, nor do we dwell too hardly on any of these institutions. It would be simply impossible for the student to give a real attendance to all the courses of lectures and hospital and dissecting-room work which he is supposed to put in, and it would be ridiculous in any College to ask him to do so. The system is simply dishonest, and its end is coming, at which all who desire to maintain the repute of our art should rejoice.

Notes on Current Topics.

Foreign Diplomas.

At a recent meeting of the London College of Physicians a communication was received from the General Medical Council, asking the college under what conditions it would be disposed to admit foreign graduates to examination. The President said that the matter had been brought before the Censor's board; but as the present regulations afforded comparatively easy and convenient facilities to foreign graduates, the board did not think it advisable to make any alterations.

Hospital Treatment of Infectious Diseases.

In the interests of sanitation and of public health, hospital treatment of infectious diseases, in cases where home isolation is an impossibility, has been frequently urged as the only practical means of controlling zymotic fatality, and the Public Health Acts of 1872 and 1873 have invested local sanitary authorities with powers to facilitate the erection of hospitals for the reception of non-pauper cases of these diseases. While the advantage to the community arising from the removal and treatment in hospital of cases of infectious diseases occurring in families living in crowded tenement houses is undoubted, it becomes important to record accurately the results of hospital treatment in the mortality of the cases. Illustrative of this some very interesting statistics have been furnished us by the Registrar-General from the Metropolitan Asylums, Fever, and Small-pox Hospitals. In the Metropolitan Asylums Hospitals, during the year 1876, more than 2,000 cases of small-pox, more than 800 cases of scarlet fever, nearly 300 of enteric fever, and 145 of typhus were under treatment. In the London Fever Hospital 518 cases of scarlet fever, 93 of enteric fever, and 23 of typhus were admitted. Of the 2,000 small-pox cases 1,377 were completed at the time the returns were made up. These 1,377 cases included 1,018 vaccinated and 359 unvaccinated; the mortality was 13·2 per cent. among the vaccinated and 56·8 per cent. among the unvaccinated.

The 804 completed cases of scarlet fever recorded in the Metropolitan Asylum Hospitals showed a mortality of 10·7 per cent. against 14 per cent. among the 1,077 cases treated in 1875; among 321 cases at Homerton the mortality in 1876 was only 8·1 per cent., whereas it was 12·4 per cent. among the 483 cases treated at Stockwell. In the London Fever Hospital 551 completed cases of scarlet fever were reported during 1876, of which 50 were fatal cases, equal to a mortality of 9·1 per cent.

The completed cases of typhus in the two Asylum District Fever Hospitals were 145 last year against 76 in 1875, and the mortality 19·3 per cent. in 1876 and 19·7 per cent. in 1875. In the London Fever Hospital only 26 cases of typhus were treated, and the 7 deaths give a mortality of 26·9 per cent.; these numbers are, however, too small for the calculation of a trustworthy rate of mortality.

Of enteric fever the treatment of 270 cases was completed at the Asylum Fever Hospitals, showing a decline of 67 from the number in 1875; the proportional mortality, which was 22 per cent. in 1875, declined to 20·7 per cent. in 1876. In the London Fever Hospital 86 cases of enteric fever were treated in 1876, of which 13 proved fatal, equal to a mortality of 15·1 per cent., a rate considerably lower than that which prevailed in the Asylum Fever Hospitals, either in 1875 or 1876.

It is generally believed that the rate of mortality among cases of epidemic disease treated in hospital is greater than among those treated at home. Assuming, however, that the proportion of deaths to recoveries is the same under both circumstances, it may be estimated that during the year 1876 the number of persons in London attacked by small-pox was 2,994, by scarlet fever 22,886, by typhus 796, and by enteric fever 4,030. These numbers would be under-estimated if the rate of mortality out of hospitals is, as supposed, lower than among the cases treated in hospital.

The London Water Supply.

Major Bolton, in his monthly report, states that the water taken from the Thames and Lea was unusually bad during the month of January, owing to the rains and floods; consequently the water supplied by the water companies was very unfit for domestic use. It appears that the January flood was the worst on record, being on the 11th of the month fourteen inches higher than that of November 18th, 1875. While the floods prevail the water companies, unprovided with sufficient storage reservoirs, are compelled to take in dirty water, and distribute such as they can get. This necessarily contains a most objectionable amount of solid matter, consisting of chalk, clay, and other organic impurities, held in suspension, and too fine to be got rid of by subsidence or filtration. Dr. Frankland reports, as the result of his analysis of the water supplied to the metropolis and its suburbs, that it is quite unfit for dietetic purposes, even after what is called "efficient filtration." The water delivered by four of the large companies drawing their supply from the Thames contained moving organisms, and in three of the samples examined fungoid growths were found.

The extreme importance of the water supply on the public health has been once more forcibly brought to public notice by the medical superintendent of Essex Hall Asylum for Idiots and Imbeciles, Colchester. Mr. Symmons, in his annual report on the health of the inmates of the asylum, states that somewhat suddenly he was called upon to treat several cases of fever—one an undoubted case of typhoid, which died. This induced him to look to the water supplied to the Institution by the local water-works company. The water was submitted to careful analysis, and pronounced "unfit for drinking purposes." After some little delay, an excellent supply was obtained from an artesian well, and all further danger of fever from that time subsided.

Introduction of Maize into Europe.

Absurd prejudices have prevented the Europeans enjoying corn cakes and boiling ears. It is a pleasure to see that M. Fea, of Padua, has lately published comparative tables to show that maize is superior to all other cereals in fatty matters, and that it may be considered as a perfect food. He also replied to objections that have been made to maize, accusing it of giving rise to certain diseases, notably pellagra; and demonstrated that the penicillum glaucum, which is supposed to originate this disease, never attacks maize unless it is damaged.

The Carlisle Place Orphanage.

Dr. H. Bartlett, Ph.D., F.C.S., writes in one of the daily papers to say that "Several lessons of truly vital importance may be brought home to us by pursuing the inquiry relating to the mortality among the younger infants at the Carlisle Place Orphanage. In the first place, the statistics of death-rate among infants of the same age at other institutions of the highest reputation enable a tardy justice to be rendered to the Sisters of that Home in exonerating them from the stigma, rightly or wrongly, attaching to exceptional misfortue in rearing

such wretched outcasts. Dr. Brewer called attention to the failure of dry nursing at our own Foundling Hospital, the mortality being 98·58 per cent. per annum. Dr. Lewis Smith, of New York, states that during the last year nearly 100 per cent. of the foundlings hand-tended in that city died before reaching the age of one year. Older statistics of Vienna foundlings give a death-rate of 92 per cent., and at Brussels the annual percentage was 79. At the Children's Clinique, St. Petersburg, the constant mortality induced Dr. Korowin to attempt the determination of the proximate causes of death in the majority of cases by *post-mortem* examinations. The most definite result shown was the fatal after effects of mal-nutrition, due to the improper and dangerous use of farinaceous foods during the earlier months of infancy. My scrutiny of the diet adopted at the Westminster Orphanage only brought out as evident two sources of mischief—badly filtered water and too great a proportion of it in the milk. The best cow's milk is scarcely so superabundant in nourishment as to require to be diluted with from 50 to 67 per cent. of water. This is the weakest point in the dietary, as it affords only a bare sustenance, if consumed in the largest quantities a sickly infant can take. Liebig's malted food is perhaps the only safe addition to milk and water, except a properly made solution of barley, but I must warn all persons having the care of infants not to adopt the formula lately handed to the Lady Superior of this Home, doubtless with the best intention. This formula unfortunately suggests the use of equal parts of seconds flour and ground malt, the latter to be passed through a wire sieve to sift out the husk. No such separation can be effected, as I find sharp spiculæ of husk pass with the flour through the finest sieves sold for domestic use. As might be expected when the food was made in this way, the infants suffered from the utmost irritation of the bowels. Bearing in mind the last case mentioned in the *Lancet* of the 13th instant, in which a child aged four months was starved to death at Plumstead by being fed on corn flour, it is plain that the dietetic management of infancy requires the whole force of these terrible examples to be made public."

Not long ago we made some remarks on infant nursing, although from a different standpoint to that taken by Dr. Bartlett. We then alluded chiefly to the infant suffering and mortality arising from the improper feeding of infants prevalent among the middle and higher classes of society. Of course the mortality among the children of the poor, and among orphans and foundlings is much greater, and it would be well if the above orphanage was the institution or place where a large percentage of the children were carried off during the first year of their existence.

The Pollution of Air by Sewer Gas.

Professor Frankland has lately been experimenting "on the transport of solid and liquid particles in sewer gases;" and as affecting the public health. The air we breathe, it is well known, contains a large amount of suspended matter, consisting principally of particles of aqueous vapour and volatile matters, disappearing by the aid of a gentle heat. There are, however, other particles, partly organic and partly mineral; in several the processes of fermentation, putrefaction and decay are going on in the world, make us abundantly sensible of their presence. Those particles—"germs"—supposed to produce disease, and which may be termed zymotic, are obviously of very considerable importance. There are now so many well authenticated cases on record of disease communicated by the escape of sewers-gases into our dwellings that no inquiry can well be of more importance than that of ascertaining the exact conditions under which noxious matters escape from the sewers, and endanger the health of individuals. Does the flow of sewage in a properly-constructed sewer, produce sufficient agitation to disperse liquid particles through the air space of the sewer? Professor Frankland has ascertained by three separate tests that no lithic chloride is carried off at ordinary temperatures by aqueous vapour from a saturated solution of this salt. Some of the solution being placed in a glass jar, it was agitated, and though this was done with greater violence than would ever happen to fluid in a sewer, it was proved that none of the lithic chloride was disengaged. It is, therefore, extremely improbable that the mere flow of foul liquid through sewers can impregnate the surrounding air with suspended particles. There is, however, another kind of agitation to which sewage is subject that may produce a very different result—viz., the development of gases during the processes of fermentation and putrefaction. When minute bubbles burst at the surface of an effervescing liquid, little particles of it can be seen projected into the air some inches, then falling again. Professor Frankland experimented to test whether particles too small to be seen might not be also projected, and in consequence of the smallness of their masses in relation to their sectional areas, might continue suspended in the air for a long time. A strong solution of lithic chloride was acidulated by the addition of hydrochloric acid, some fragments of white marble were added, and this produced an effervescing liquid. A tube 3 in. in diameter and 5ft. long, was held over it, and there were distinct traces of lithium found during effervescence at the upper end. A second tube 3in. in diameter and 12ft. long, was then held nearly at right angles at the top of the first, a slight draught through it being caused by external heating. At the further end of this tube, too, lithium was distinctly traced. The particles were also found to pass readily through two inches of charcoal, and they passed even a layer five inches thick, though in greatly diminished numbers. Here then in the breaking up of minute gas bubbles is a cause of the suspension of particles in the air. If, therefore, through the stagnation of sewage or constructive defects which allow of the retention of excrementitious matters for several days in a sewer, putrefaction sets in, then gases are generated, and the dispersion into the air of zymotic matters is very probable. It is of the greatest importance that foul liquids should pass rapidly and freely through drain-pipes and sewers, so as to secure their discharge from the system before putrefaction sets in.

Professor Frankland's experiments, therefore, so far prove that, however unpleasant the odour emitted by sewers, they do not necessarily impregnate the upper stratum of air with disease germs; but if the sewer is allowed to become stagnant, myriads of bubbles of sewer gas are given off, and they act as zymotic ferments; but if

a stream of water is continually passing down, these are carried away, and become *innocuous*.

In connection with this subject, we may mention that we have lately made trial of a new disinfectant: a solution of salicylic acid, known as "Salicòl Dusaule Désinfectant Hygiénique," prepared by M. Bruley of Paris, and so far as our experience of its value has gone, we may say it bids fair to become a useful addition to our too small list of reliable disinfectants.

The Vivisection Act.

THERE are, and we suppose ever will be, weak-minded people enough in the world, ready and willing to do the bidding of a noisy set of fanatics, whether it be on the question of vivisection, vaccination, or any other mania. Those who entertain a craze against the profession, and who find it answer their purpose to keep up the agitation under the name of "Anti-Vivisectionists," and who openly declare that nothing will satisfy them except the total suppression of scientific men and "the right of entering *at all hours* hospitals, workhouses, &c., to prevent cruelty and oppression, put down vivisection and its attendant evils"—whatever all this bunkum may mean—succeeded in getting Mr. Mundella last week to move the House of Commons for a return of licences granted under the Act passed to amend the law relating to cruelty to animals.

It is almost too much to suppose that the word or promise of a Minister of the Crown will pacify those who take delight in promulgating untruths with regard to vivisection. Mr. Cross, however, in a straightforward manner, at once consented to the return asked for, and took occasion to remark that those members of the profession who were concerned in the question had met him in every possible way, and it would be found, when the return was granted relating to special certificates for the performance of experiments on animals without anæsthetics, that one such certificate only had been given, and that was given not because it was an experiment calculated to cause pain, but because there was some doubt whether the *slightest puncture* might not subject the operator to some malicious prosecution. He was able to say, however, that up to the present moment, as far as the Act was concerned, there had been no experiment performed on any animal in England calculated to give pain. He hoped, when the return was made, the House and the country would be equally ready to acknowledge what to his mind reflected the highest honour on the medical and scientific world. They had shown themselves ready to join that House and the Secretary of State, and the feelings of the country as far as possible, and to co-operate to show an example to foreign countries that they had no intention, unless they were bound to do so, to inflict pain of any kind on any animal.

A Curiosity of Medical Literature.

THE following advertisement appears in a Dublin paper:—

"I STAKE MY REPUTATION that a Blister—size of a shilling—to the pit of stomach, an open window day and night, dry toast bread and tea, and repeated spoonsful of whiskey, will cure the most malignant attack of small-pox. Washing-room floors in a close air, with soiled stale suds is a great feeder of it. Anyone having a dread of it can keep it away by salt friction over the chest and stomach bi-weekly.

"CHARLES O'SHAUGHNESSY.

"Feb. 23rd, 1877."

The subscriber is a haberdasher in Kilmallock, and formerly the owner of well-known racers.

New American Medical Colleges.

THE *Philadelphia Reporter* says:—

"A new medical college is about to be started in New Albany, Indiana. Another one is announced from Nashville, Tennessee, of which Professor Paul F. Eve is the chief officer. It is on the 'two terms in nine months' system, which is said to be based on the analogy of nature; for as it requires but nine months for an embryo to become an infant, it should not ask more for a dunce to become a doctor."

This statement, and others frequently quoted to similar effect in our columns, ought to make licensing bodies cautious of recognising any certificates or other guarantees of medical education which have the fragrance of America upon them.

Outbreak of Typhoid in London.

DR. STEVENSON, the medical officer of health for the district of St. Pancras, reports an outbreak of typhoid fever. Of fourteen cases investigated, thirteen had been supplied with milk by one vendor, who obtained it from three separate farms. Two of these farms have been reported upon by the local medical officer of health, who states that impure water was used for rinsing the pans and pails, to which the contamination is attributed. The report upon the third farm has not yet been received.

Change of Climate in Great Cities.

AT the monthly meeting of the Meteorological Society of Great Britain, on Wednesday last, Mr. Eaton, the president, delivered an address which is of great interest at the present time, as tending in some measure to elucidate the change of temperature which has been observed in our great cities in the winters of past years. After referring to the various theories advanced to account for changes of climate, he observed that in drawing deductions from a long series of observations of the temperature of the air, it is important to ascertain whether the conditions of the surrounding district have altered. Otherwise, changes in reality due to local causes may be erroneously assigned to secular variation. The climate of London has thus been modified by the consumption of fuel and the vast population. He estimated that the heat developed from the present annual consumption of 5,000,000 tons of coal on the metropolitan registration area of 118 square miles, and from all other artificial sources, would suffice to raise the temperature of a stratum of air 00ft. depth resting on that area 2°·5 every hour. The effect of the growth of the population of London from 900,000 at the commencement of the century to 3,500,000 at the present time, and of the still greater increase in the comparative consumption of coal, was manifested by the rise in the average temperature of the air at the Royal Observatory, Greenwich, which place was year by year becoming more surrounded by a network of houses and population. For this reason Greenwich was not a suitable place for a meteorological observatory of the first order.

Royal College of Physicians.

At the meeting of the College which was held on Wednesday last, a report was read from the Censors' Board with regard to the admission of foreign graduates in medicine to examination. The Board proposes that the College should exercise a discretionary power in admitting to examination any foreign graduate who may (in their opinion) have already passed a sufficiently good examination, and also that such examination should in some cases be modified.

An Interesting Discovery.

At the last meeting of the Royal College of Physicians, the President announced that an important discovery had been made by Dr. Sieveking, in the British Museum, of the MS. of the notes of the lectures delivered by Harvey before the College. An autotype copy of the last page was sent round, the contents of which related to, and comprised the sum and substance, of Harvey's discovery of the circulation, especially his opinion respecting the use of the circulation in relation to the nutrition and heating of the body.

A death by ether reported from America turns out, on further inquiry, to have been one by chloroform; so it must be scored on the other side in the controversy about these anæsthetics.

There were 95 deaths from small-pox in the United Kingdom, last week, of which 72 occurred in London, 15 in Liverpool, 7 in Manchester and Salford, and 1 in Birmingham.

At the quarterly court of the Brompton Consumption Hospital last week, the receipt of the following bequests was announced:—Mr. Charles McGarel, £1,000; Mr. G. Moore, £1,500; Mr. W. Holsworth, £100; Miss Porter, £50; Mrs. Holmes, £50.

The death-rate in all the large cities of the United Kingdom continued very low for the time of year. Last week the mortality was at the rate of 22 per 1,000 in London; 26 in Dublin; 26 in Glasgow; and 21 in Edinburgh.

We are glad to learn that the charge against Dr. Edgar Jones, Cardiff, of assaulting Elizabeth Moore, by cutting open her wounds, was dismissed by the Cardiff magistrates. They believed the evidence of the prosecution had been coloured.

The death-rate from the seven principal diseases of the zymotic class, in London, is at the present time considerably below the average of the last ten years. This shows that, although small-pox is epidemic in certain localities, the other forms of disease are almost infinitesimal.

The returns from the different hospitals showed that the number of small-pox patients was—in Homerton Small-pox Hospital, 118; in Homerton Fever Hospital, 33; Stockwell, 135; Hampstead, 273; and Limehouse, 129; making a total of 889 under treatment in London last week.

Dr. Crichton Brown, Dr. Forbes Winslow, Mr. Erichsen, and others having shown the convict Treadaway to be subject to "epileptic vertigo," during which he was practically irresponsible for his acts, Her Majesty has been advised to respite the capital sentence passed on him to that of penal servitude for life.

A well-known and much respected face has passed from St. Thomas's Hospital, by the death of Mr. R. G. Whitfield, medical secretary, who died on Wednesday last, at his residence in Wandsworth Road. His father and grandfather held the post of apothecary in the hospital for upwards of 110 years.

At the quarterly court of the governors of the Middlesex Hospital, fears were expressed that many original subscribers now withheld their contributions, conveniently supposing that a donation to the Hospital Sunday Fund relieved them from all further responsibility. We trust this will not be found to be the case in any but rarely exceptional instances, as the Sunday Fund, though most valuable, can only be considered as an adjunct to existing contributions.

The annual meeting of the governors and subscribers to the Hospital for Diseases of the Throat, Golden Square, was held on Saturday last in Willis's Rooms, St. James's, the Recorder of Norwich presiding. The financial position of the Institution was shown by the report to be in a most satisfactory state, there being a balance of £2,303 in hand. The report was carried, as was also a vote of condolence with the family of the late Sir William Fergusson.

The anti-vaccinationists have just met with a defeat at Cambridge. Mr. W. Hume-Rothery and other members of the Anti-Compulsory Vaccination League, got up a meeting at Cambridge, to protest against vaccination, but their monstrous exaggerations and mistatements were so ably refuted by Mr. J. F. Little, L.R.C.P., an undergraduate of Downing College, that an overwhelming majority of those present voted in favour of a resolution, declaring that vaccination has been a great national blessing.

Correspondence.

EXEMPTION FOR LADY DOCTORS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—Your remarks relative to the females admitted to examination by the Irish College of Physicians are most just. I do not object to women being admitted to examination by any of our licensing bodies, but I do protest against their being admitted on conditions different to these required from males.

The College of Physicians by its bye-laws, requires candidates for its licenses to produce certain certificates of lectures on anatomy, physiology, &c., &c., "from recognised schools of medicine." Did the ladies recently examined in that college produce these? I do not believe they did. Is the school of medicine at Zurich recognised by the College? and if so did

these candidates obtain there all the necessary certificates? I have reason to believe they did not, but that a large portion of their education was received from private teachers.

The question raised is this—Does the Irish College of Physicians, while granting permission to female candidates, take care to ascertain that they have been educated in accordance with the regulations of the College?

If they have not done so they are fairly open to the charge of admitting for the sake of gain to examination imperfectly educated candidates. It matters not what the sex of the candidates may be, the result is the same; they lower the educational status of the whole profession, and, for the sake of a paltry gain, degrade their College.

I am, &c.,

A Subscriber.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—I cannot allow your remarks on my letter of the 15th instant, which appeared in your issue of 21st, to pass without comment, as I find that my language was not as explicit as I had intended it to be on the subject of the exemption which this college grants to holders of certain foreign universities. In my letter I stated that a privilege similar to that which the college extended to Miss Walker-Dunbar in January, on account of her holding the M.D. University of Zurich "has been extended" to holders of certain foreign universities, which I enumerated.

This language, I should have thought, would have conveyed to your mind that holders of medical degrees in the Universities I named *have* presented themselves for examination for the licenses of this college, and that they *have been* given the privilege of being exempted from examination in the subjects of the first professional examination, by reason of their holding such medical degree. I regret, however, to see that I have been misunderstood by you, since you write (Feb. 21st)—"We were *not* aware—nor do we know where the informrtion is to be found—that any other foreign university but that of Zurich had been admitted by the College to such privilege."

I beg now to supply you with the information you need, and in as explicit a manner as possible to state that several candidates who were holders of the medical degrees of the foreign universities which I enumerated in my letter of 15th instant *have been* admitted by the College to the second or final examination only for the license of the College, and that after such examination some have been admitted as licentiates and have signed the College roll.

From what I now state and from what I said in my letter of 15th inst. it must be evident to your readers that the assertion which appeared in your editorial remarks on 14th is not based on facts, nor is it borne out by the practice of the College, viz.:—"The Irish College of Physicians is bidding hotly for the patronage of the lady doctors by accepting from them curricula which they would not receive from a male student." . . . . . and "that they have recognised" (in the case of Miss Walker-Dunbar) "as evidence of competency a foreign degree which, if presented by a masculine medical student, would have been unhesitatingly refused."

I have the honour to be, Sir,

Your obedient servant,

J. Magee Finny, M.D. Dub.

Fellow and Registrar.

King and Queen's College of Physicians in Ireland.

Dublin, February 24th, 1877.

[We have reason to believe that the number of male persons who have received the license of the College on foreign degrees is infinitesimal, and the date of their admission long past, and that the recognition of the Zurich degree was therefore an extraordinary privilege conferred for the express purpose of admitting female candidates who could not give the usual guarantees of education. Dr. Finny has not given us the numbers or times for which we asked, and has, therefore, not contravened the inference which we drew.

In Chapter VI. paragraph 3, of the Bye-laws (page 17) we find it stated that—"Candidates (for the license) are required to give proof of . . . . . having been engaged during a period of four years in the study of medicine *at a school or schools recognised by the College*," and we are interested to know in what school the last lady licentiate studied? When that school was recognised by the College? and were certificates produced for the usual courses of lectures and hospital attendance? Upon the reply to these questions hangs the inuendo of which Dr. Finny complains, and we must therefore be excused for putting him to the trouble of a reply, for we have not been able to find amongst the bye-laws any modification of this law. As the matter stands in the absence of that information the College appears in the position of breaking its own bye-laws and dispensing with its own curriculum, and, as we should be sorry to see the Irish College of Physicians lowered to the level of the Queen's University or the Scotch Colleges, it will be a pleasure to us to be able to say that it has been uniformly adherent to its own bye-laws and regardful of its own reputation.

THE BALLOT QUESTION AND THE KING AND QUEEN'S COLLEGE OF PHYSICIANS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The "Ballot Question" in the King and Queen's College to which you call attention in your issue for February 14 is one of such importance to the licentiates of the College, and, indeed, indirectly to the whole profession, that I ask your permission to afford me space to discuss it more fully. The facts are briefly these:—

1. The College, as a body, desires to remain, if possible as at present, a small exclusive self-electoral body.

2. As a means to effect this it seeks for the ballot.

I say the College, "as a body," desires to remain as it is at present. Four or five Fellows doubtless protest that such is not their wish and oppose the application for the ballot, on the ostensible ground that they do not wish the College to be restricted in number, but these gentlemen, when the proposals of the chief Secretary were under consideration, voted for a resolution to the effect that they disapprove of the change in the constitution of the College suggested by him—that is, the institution of a Council.

The plain inference to be deduced from this resolution is, that every Fellow who voted for it wishes the College to remain as it is—a small exclusive body; and the few Fellows who dissented from the subsequent resolution asking for the ballot are, in truth, as chargeable with connivance at a perpetuation of the present system as is the most open advocate of the ballot, for if a Council be not instituted the inducement to limit the number of Fellows remains in full force.

The Chief Secretary has taken a clear statesmanlike view of the case, he objects to the restriction of the College to its present narrow limits, and as the only possible means of accomplishing the enlargement of the College suggests the establishment of a Council, and refuses the ballot.

The establishment of a Council would be most beneficial in many ways—

1st. It is the sole means whereby an enlargement of the College to even a moderate extent is possible. So long as the Fellows at large constitute the governing body so long there will be a justifiable effort on the part of the existing Fellows to limit their number.

2nd. It would make the College what it does not at present,

reflect the feelings and wishes of the profession at large, what the wishes of the bulk of the members of the profession may be, is unknown to those who, sitting in conclave in the College Hall, can influence so largely for good or evil the interest of the profession.

3rd. It would render the value of the Fellowship of the College much greater than it is at present to country practitioners, and to those Fellows resident in towns who have not time to attend its meetings.

At present the Fellowship of the College is a barren honour to both of these classes. A Fellow resident in Cork or Londonderry has practically no voice in College matters, but, though under the constitution suggested by the Chief Secretary, they would be unable to take part directly in the management of its affairs, as, indirectly, their power would be greatly augmented, for they would elect men to the Council who would represent their views and be mindful of their interests and reject those in whose judgment or character they felt no confidence. This would be still further the case if on the election of Council the use of voting papers were permitted as is the case in elections of members for the University.

I believe that, sooner or later, the course pointed out by the Chief Secretary must be adopted; it may be delayed, but it cannot be averted. There is no doubt but that a few of the Fellows conscientiously believe that the institution of a Council would be injurious to the welfare of the College; they think that the dignity of the College is best secured by its remaining a small exclusive body, but it is equally certain that the reasons pointed out by you are potent with others, who fear that they may not be elected on the proposed Council. These arguments will have no weight, because they will not submit to a personal sacrifice for the good of their College and the welfare of their profession.

In conclusion, I would endorse your suggestion—that if the licentiates can ever wish to occupy any position in the College, or desire to have a voice in matters which so nearly interest themselves, they should bestir themselves. I believe, further, that if they promptly express themselves in favour of the course pointed out by the Chief Secretary they will meet with support from him.

I am, &c.,
LOMBE ATTHILL,
Fellow of the College of Physicians.

Rotunda Hospital,
Feb. 24, 1877.

ARMY MEDICAL OFFICERS' QUARTERS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I take the liberty of asking you to insert in your journal a few remarks relative to the latest breach of faith in connection with the Army Medical Department. By War Office Circular of the 1st January, 1877, it is laid down that medical officers when in barracks will only be allowed regimental quarters. Now what does this mean? That, in future, surgeons can only claim one room and portion of a kitchen, in place of three rooms and a kitchen as heretofore; a surgeon-major will now only be allowed two rooms and part of a kitchen, but previous to the issue of this circular he was entitled to four rooms and a kitchen, and if these were not available he could claim lodging allowance in lieu at the rate of 4s, 6d. per day.

We are led to believe that as departmental officers staff quarters were guaranteed to us, but now with a stroke of the pen this, our compensating advantage of the departmental system, is done away with. Surely Sir William Muir cannot hope to have a contented department, or to attract young medical men to it, which is treated on all occasions by the War Office authorities as the "poor relation of the service."

All our privileges have been one by one swept away in this off-hand manner, and the only consolation remaining to us is that we have none now left to be removed.

I am, yours most faithfully,
A. M. D.

A NEW EYE DOUCHE.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Several patients to whom I have recommended the use of an eye douche having complained to me of the unsatisfactory working of the instruments, I applied some months ago to Messrs. Arnold and Sons, of West Smithbeld, for a better.

They have made for me a new eye douche upon the principle of their "Simplex Enema" syringe, as illustrated above. It has worked extremely well in my hands at repeated trials, and it seems little likely to get out of order. I beg leave, therefore, to bring it before the notice of the profession, and to recommend it as a well-made and useful instrument.

PRIESTLEY SMITH,
Ophthalmic Surgeon to the Queen's Hospital,
Birmingham.

Note.—The engraver has made a mistake in the above wood cut. The eye should he *closed* instead of *open*.

THE VACCINATION ACT.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—An evil more frequently emanates from that which appears on a superficial survey to be of too insignificant a nature, than is usually supposed; and nothing better exemplifies this seeming paradox than the Vaccination Act, which is imagined by many to be altogether faultless; for the very mischief which this Act was made to suppress, is, indirectly allowed by it to continue; in other words, small-pox is fostered by the Act, and this letter will I think tend to prove that such a statement is not a mere assertion or an erroneous opinion.

Those who have the idea that the Vaccination Act is perfect, and that the working of it is without a flaw, must have inadvertently skipped over the clause stipulating the amount of the fine imposed for non-vaccination, for on *this* clause hangs the fate of small-pox and its antidote, and on mature reflection, I cannot refrain from coming to the conclusion that the present outbreak of this disease may be justly ascribed to the bad working of the Act originating from this clause.

A celebrated M.P., famous for his wit, whose name has slipped from my memory, once said, with truth, that he could without the slightest difficulty, drive a coach and four through

any Act of Parliament; but through *this* Act the poorer classes may drive their donkey-carts, with any number of those quadrupeds attached thereto, and it may be, with greater facility; for it is amongst these (I refer to those beings whose intellects are somewhat akin to the animals they drive) that the greatest difficulty is experienced in making them conform to the law, and which some, more obstinately disposed than others, very easily evade by obeying the clause, and not the Act.

Therefore I think we may, with reason, be fully justified in stating, as a fact, that as long as the clause of the Vaccination Act referring to the paltry, insignificant fine imposed on those people who will not have their children vaccinated, remains unabrogated, so long shall we be liable to be pestered with small-pox.

The medical press and the daily papers may direct public attention to the advantages derivable from vaccination, and the exemption from a disfiguring disease being secured by such a simple operation, but it will be to no purpose as long as the clause remains as it is.

Attention may be called to undeniable statistics, which cannot by any manner of means be glossed over by specious arguments, or malicious misrepresentation; vaccination stations may be established in every conceivable place, so that the greatest facility may be given to those who wish to be vaccinated or revaccinated.

Regarding adults being vaccinated for the *first* time, however improbable it may seem, I must frankly confess to my opinion that there are some who *never* have been vaccinated in childhood, owing to the blind obstinacy of their parents. This appears at first sight to be open to doubt, but when we take into consideration the import of the clause to which we are referring, we may deduce thence that opinion which I have just expressed, without being thought unreasonable, and without being guilty of exaggeration, and a certain fact, which I shall mention further on, will prove it beyond contradiction. The utmost sanitary precautions may be taken, the contumacious may be prosecuted, the prosecutions may be carried out to the strict letter of the law, which is twenty shillings fine, or fourteen days' imprisonment, still small-pox is as rampant as ever, and will undoubtedly remain so (at least for some time) as long as the mischievous clause remains, I may say, *in statu quo*.

When we take into consideration many matters connected with vaccination, one cannot help doubting the *real* efficacy of an Act containing a clause allowing of evasion of the same; and the question therefore arises, what is the use of it, when it can be, without much difficulty, so easily put on one side? To my mind such a clause is a palpable absurdity; it spoils the working of the whole machinery, and it completely stands in the way of the main object (which we *all*, except those who are opposed to conviction) viz., universal vaccination; therefore, the sooner it is done away with, the better it will be for the general health, for I am quite certain that small-pox will never be entirely eradicated as long as this clause remains unaltered, or better still, until it is eliminated from the Act altogether.

Such a fine should be imposed as should render it impossible for many to pay, and those who are able to do so, imprisonment, averaging from three to six months, and upwards, should loom in the distance in case of non-compliance: for some people, through their narrow-mindedness, are so infatuated with their own crude notions and crabbed opinions, or perhaps they are plagued with a natural perversity of disposition, that nothing short of severe and harsh measures will make them conform to the law.

It is a much more heinous offence to my way of thinking for parents to endanger the lives of their children, than neglecting sending them to school; and if the School Board authorities act almost with undue severity, I most decidedly think that those upon whom the safety of the public health depends, and especially those upon whose shoulders the responsibility principally falls, should proceed with determination and vigour against all those, rich and poor alike, who do all they possibly can to evade and obstruct the proper working of the Act; but I am sorry to observe that however anxious they may be to perform their duties, they cannot satisfactorily follow them out, because of this clause, and which they never will be, until it is altered or abrogated.

Therefore, in justice to the nation at large, non-compliance to vaccination should be considered much more reprehensible than non-compliance to education, and therefore a much more severe punishment should be meted accordingly; for if people wilfully try to set the law at defiance in *one* matter, and are consequently punished if they do not conform, they should be made to feel the powerful arm of justice *more* severely in *that* matter which is the more important of the two.

It seems supremely ridiculous to me, that men should draw up an Act of Parliament, and then insert a clause almost rendering it nugatory; such an Act does not speak much for the astuteness of those learned gentlemen of the bar, whose cranial contents are supposed to be a little clearer than those who are outside the legal profession. I myself am much disposed to think that these *very* learned gentlemen intended either to create a loop-hole by which those who, through obtuseness of intellect, are antagonistic to vaccination, and accordingly prefer small-pox to escape, by paying the exorbitant amount of twenty shillings, or submitting to the long imprisonment of fourteen days; but now when I come to think over it, most probably they wished to demonstrate to the world, their legal finesse, their wonderful ingenuity, and their extreme skilfulness in drawing up an Act of Parliament, whose "modus operandi" is almost completely nullified by this marring clause.

It is now proved quite beyond contradiction or doubt, that vaccination is the antidote, I can use no better word, to small-pox; in fact, it is the greatest triumph of preventive medicine at the present day, whatever a certain obscure metaphysical politician, who writes his thoughts on post-cards, and others, who vainly imagine it is an honour to follow in his wake, may assert to the contrary; and the only way to check the epidemic which is now spreading so quickly, and prevent an outbreak at some future period, is to annul this clause, considerably enlarge the fine, or increase the term of imprisonment, for if it remains in force, we shall always be liable to an outbreak of small-pox, when we do not expect it, and which no doubt *will* spread, however we may strive to stop its progress.

The following fact shows the facility with which the Vaccination Act is set aside by the poorer classes, simply through the medium of this clause, for there are clubs established among them, which have funds, to which all subscribe who have a foolish antipathy to vaccination, so that when they are prosecuted, they are enabled to pay the fines at *once*, without experiencing any individual loss, except their paltry contributions; if these, therefore, through the agency of a conjoint scheme, so completely evade the working of the Act, to the detriment of others, how much more can those who are in the higher walks of life do the same? for it is well known that there are many such who are deadly opposed to vaccination, though the why and the wherefore they cannot satisfactorily explain even to themselves.

Bearing all these things in mind, we cannot have the slightest hesitation in coming to the conclusion that the only way to arrest the ravages of this dire enemy, both at the *present* time and in the *future*, is, either to abrogate the clause altogether, increase the fine, or else imprison from three to six months, or even upwards, all *those* who are truculently disposed without the option of such.

I am, Sir, yours obediently,

E. M. Boddy, F.R.C.S.

Camberwell.

ANIMAL VACCINATION AS PRACTISED IN BRUSSELS AND IN BOSTON, U.S.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—The splendid discovery of the Englishman, Edward Jenner, that the inoculation of an individual by the lymph of cow-pox is a preservation against the ravages of the most hideous of human plagues, has been admitted in all civilised countries by the overwhelming mass of instructed persons to be the greatest triumph of hygienic science possessed by our race. The practice of vaccinating from the arm of one child to that of another was in this country, until quite recently, considered to be amply sufficient to ward off all risk of contagion from small-pox, and hence the manifest duty incumbent on all persons who beget and rear children, to care for their welfare, was changed into a law some years ago, compelling all parents to have their children vaccinated before the age of three months. In this matter England has shown its wisdom and scientific culture, and is at the head of the nations.

Two difficulties, however, lie in the way and prevent this excellent law being always carried out without fail. In the first place, it is alleged that certain dangerous contagions, and

above all, syphilis, have occasionally been spread from a diseased child to a healthy one during the process of arm to arm vaccination. This was, until quite the other day, strenuously denied by the mass of medical men in this country; and no doubt such a catastrophe is of such a very rare occurrence as to be hardly worthy of any sensible parent's consideration. Nevertheless, there is now no doubt that such contagion has been known to spread *from an apparently healthy infant* to others; and hence it is incumbent, I think, on the part of the State to respect the tender scruples of very sensitive parents if possible. The second obstacle in carrying out the practice of vaccination at present arises from the difficulty that is often experienced by practitioners in obtaining vaccine lymph for the purpose of vaccinating infants for the first time, and, above all, revaccinations which, at such a moment as the present in London, are eagerly demanded by hosts of well-educated persons, in consequence of the spread of the disease in all parts of the metropolis. It is well known that the Government Institution for Vaccine in Whitehall, although most anxious to be of service to the public, is quite unable to meet the pressing demands made on it at this time.

For these reasons I would urge in your public spirited journal on our Government the advisabily of having as soon as possible recourse to the admirable method of culture and expedition of animal vaccine lymph, which obtains in Brussels, and has been in vogue there most successfully since 1865. Of 1,000 medical men practising vaccination in Belgium, we are told by Dr. Warlomont, the distinguished and most eminent physician at the head of the State Vaccine Department, no less than 768 applied for vaccine points of animal vaccine to the Institute in 1873, which shows how completely the very highly educated and intelligent medical practitioners of Belgium have come to prefer animal to ordinary humanised lymph. The same able authority, Dr. Warlomont, tells us that vaccination of infants made with animal vaccine points has succeeded in 96 per cent. of the cases vaccinated, whilst revaccination succeeded in 62 per cent.

With regard to the preservation against small-pox conferred by this form of lymph, Dr. Warlomont reports that out of more than 10,000 children vaccinated by calf-lymph from 1865 to 1870, and passing through the terrible epidemic of 1870-71, not a single one was attacked by small-pox; and that the same tale held good for those adults who were revaccinated, a far greater number. With respect to the difficulty of obtaining supplies of lymph, which, as I before remarked, prevails to such an extent in London just now, and whenever an epidemic of small-pox arises, this is no longer possible in Brussels, because, as the inoculations are made from calf to calf, there need be no difficulty in obtaining as much lymph as is needed by the simple expedient of borrowing more calves from the butchers, inoculating them without causing the slightest injury to the health or marketable value of the animals, and restoring them to the owner at the end of the week in as excellent condition as when they came. In a recent epidemic in Brussels, to show how rapidly vaccine-lymph is obtainable, 500 points of animal vaccine were sent away *daily*, and it is clear that 5,000 or 50,000 could have been sent out if only more calves had been used. It is the custom to vaccinate the indigent (I hope they are really indigent, and not like the sturdy beggars of our metropolitan medical charities) gratuitously in Brussels from the calves; other persons are revaccinated by payment of a fee, and all persons of the medical profession in Belgium are allowed to send for the animal lymph by forwarding the payment for it in advance. In this way, in seasons of epidemic, there can always be raised an unlimited supply of the lymph which is obtainable by all the vaccinators of Belgium. I have frequently sent for lymph from Brussels, and found it most successful in raising a fine vesicle in vaccinating infants. Other *confrères* have found the same.

Taking all these facts into consideration, what I wish to urge through the medium of the columns of the MEDICAL PRESS AND CIRCULAR is, that our own Government should be urged to take upon itself the carrying out of this very important part of public hygiene. It is far too important and too laborious to be undertaken by a private practitioner, and requires the undivided attention of gentlemen paid *ad hoc*. A Government commission might at once be empowered to inquire into the question, and ask Dr. Warlomont to come over here; and if all that I have said be found to be consonant with truth, measures might at once be taken (and the sooner the better) to make the practice of animal vaccination a part of the functions of our central medical department at Whitehall. At this moment, as I have said, this department admits that it finds itself totally inadequate to meet the numerous demands made upon it for lymph; and it is, therefore, I submit, very clear that the time has come when a more perfect and irreproachable source of lymph were made accessible to the people of this country. For, although a wise parent will, of course, vaccinate his children with human lymph and accept the slight risk, it were better to have no risk at all.

I remain, yours, &c.,

CHARLES R. DRYSDALE, M.D., M.R.C.P.L., F.R.C.S.E., Senior Physician to the Metropolitan Free Hospital.

17 Woburn Place, London, W.C.

WARBURG'S TINCTURE AND THE OLD FORMULAS OF THE OLD DISPENSATORIES.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—I must confess I have had no experience of the complex formulæ to which you directed our attention last week, but I do know something of other old formulæ which we have neglected and thrown on one side to meet the requirements of modern scientific medicine. Simplicity in prescribing has been our aim, but in our present state of therapeutical knowledge we may sacrifice efficiency by too strictly adhering to this rule. I think you have shown this by your excellent article. The *rationale* of the action of Warburg's tincture cannot be explained. We know that *mineral waters are complex in composition, some of them, as Vals Waters, containing as many as fifteen different salts, all having an elective affinity for some individual part of the human organism.* When taken, their effect is thus divided: each salt works on some special part, and according to the want in the system, some benefit is derived from the peculiar selective actions of each individual medicament.

Nature's laboratory surpasses all chemical competition. We may analyse, but we never can make a mineral water like one that wells out in all its freshness from the pure springs at the fountain head either of Vals, Carlsbad, or Frederic hall. Most of the secret remedies are complex as Warburg's Tincture and chlorodyne, and a good number of them owe their properties to their carminative, aromatic, and stimulating ingredients.

There are several old formulæ that are efficacious and well worthy of trial in certain affections. I may mention a useful one for flatulency and gripes:—

Cloves, nutmeg, mace, cinnamon, aa ʒj.; Saffron, gum-mastic, aa ʒj.; Grains of Paradise, zedoary, angelica-root, dragon's blood, long pepper, Winter's bark, aa ʒj. Infuse for seven days in one pint of rectified spirit. Dose—one teaspoonful in a cup of tea.

A stimulant and strengthening mixture in use by our forefathers, called "Usquebaugh," was made thus:—

Aniseed, liquorice, aa ʒj.; cloves, mace, nutmeg, cinnamon, ginger, aa ʒss.; dates, raisins, aa ℥ʒ.; rectified spirit, 1 gal. Infuse ten days, strain, colour with saffron. Dose—half a wineglass.

Yours faithfully,

Feb. 23, 1877. LAUDATOR TEMPORIS ACTI.

CHEAP DOCTORING.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Bearing in mind that experience is the great necessity of the medical man, and that thorough aptitude in the recognition and treatment of disease is only to be arrived at from multitude; also that as men advance in practice they eliminate from their formulæ all but the sure and ready remedies, leaving to bookmakers and lecturers the vague and uncertain. These facts are the wealth and foundation of dispensary practitioners, who, unlike the gratuitous prescription distributor, immediately derive benefit without injury to the independence of the patients, and without profit to the chemist, and in consideration of the class of patients to the advantage of the ratepayers. They likewise correct the injustice of the hospital out-patients' room; and when considered philosophically and

without prejudice, will be regarded as the true philanthropists of the profession. You may perhaps raise your eye-brows in unbelief, and mutter, can this be done for fourpence?

I answer, well, and leave a fair margin of profit for the prescriber in many cases; truly there are exceptional cases of interest where the client carries away much more than has been paid for, but these cases are comparatively rare; and from these at least a good and kind name may be derived. Test the principle crucially. Take a dozen cases as they arrive in your consulting room, write your prescription, eliminate from your formulæ the unnecessary, refer them to the price list of my druggist, Messrs. Corbyn, of Holborn, and the result will be the proof. You will remember that the many give experience, the many also repay. Now what does your journal or the like do, to correct the illegal prescribing of druggists, who, offering medicine at a low rate, place drugs together in a bottle without educated judgment; by this practice draw much money which should pass to the medical men, also by their nostrum-vending, sanction the use of the remedies, so called, which by an iniquitous law are allowed to outrival legitimate practice. Do your journals persistently and honestly use their influence to arrest such practices, or do you not rather turn your forces against the only powers who, by placing before the people honest experience and medical treatment at a reasonable rate, reduce the reasons for seeking illegitimacy of practice to a minimum. Concerning the question of advertising, I must refer you to the practice of special hospitals, as in *Lloyd's Weekly Newspaper*. These are the schemes of the leaders of the profession, and are necessary for success. They are the advertising propensities of the medical fraternity.

Sir, yours faithfully.

P. V. Timothy, L.R.C.P., Lond.

[We are grateful to our correspondent for letting us into the secret of the success of the fourpenny dispensaries. It is now confessed for the first time that, in the supplying of medicine to fourpenny patients, the proprietors of such institutions "eliminate from their formulæ all but the sure and ready remedies, leaving to bookmakers and lecturers" the rest of the Pharmacopœia. The *modus operandi* is naïvely described by our correspondent. Take a dozen cases as they arrive in your consulting room, write your prescription, eliminate from your formulæ the "unnecessary," and so forth. What between confining themselves to the "*sure and ready*," and eliminating "the *unnecessary*," the letter of our correspondent seems to corroborate on the best authority our recent statement that a little nasty-tasting liquid and a dose of salts is the lot of most fourpenny patients. It would be of material advantage to the profession if we were informed as to what constitutes the "unnecessary." Perhaps anything costing more than threepence a pound would come within the category.—Ed. *M. P. & C.*]

Literature.

THE COUNTRIES OF THE WORLD. (*a*)

These numbers of the serial which the Cassell firm are issuing in monthly parts, happen, just now, to possess special interest, inasmuch as the first four numbers of the series are devoted to Arctic travel, and the manners and customs of the Esquimaux and Greenlanders, and the account given by Dr. Brown, may be read with advantage as a pendant to the narratives of the Arctic Expedition, with which the newspapers have made us familiar. Dr. Brown's work is apparently accurate without losing its popular character, and its reading is, therefore interesting; while it conveys information which may be relied upon. The illustration of the book is especially admirable, each having a finely executed frontispiece and numerous woodcuts of remarkable excellence. The sixth part enters upon the description of Hudson's Bay Territory. The fur trade, the customs of the North American Indians, and the mode of life of the trappers, and the interest of the narrative is in no way prejudiced by the change of scene. There are few of the institutions of the country doing so good a work, and none so large a work in the education of the middle classes as the Cassell firm. Their works are well selected for general reading, pure in tone and in literary style, and elegant in production.

(*a*) "The Countries of the World." A Graphic and Popular description of the Countries of the World. Illustrated. By Robert Brown, M.A., F.R.G.S., Ph.D., F.L.S., late President of the Royal Physical Society, Edin. Cassell, Petter, and Galpin. 4to. Parts, 2, 3, 4, 5, and 6. Each pp. 64.

THE REPORTS OF THE LONDON HOSPITAL MEDICAL AND SURGICAL REGISTRARS. (*a*)

The first thing that strikes us on taking up these reports, which are bound up together to form one volume, is the large amount of space occupied by the medical compared with the surgical cases. To the discussion of the former 125 octavo pages are devoted, while the latter occupy only forty-six. This is the more surprising, as the London Hospital has always been celebrated as a surgical school from its foundation. We find that the average number of medical cases in the hospital is 247; of surgical cases 306, giving a total of 553, one of which few metropolitan schools can boast.

We notice in the medical report the record of six cases of ague, all of whom were treated with quinine and recovered. On the same page also we notice the record of a case in which a patient appeared to contract enteric fever in the Hospital. . . . There was a case of enteric fever in the bed next to this patient, whose stools were emptied down the water-closet of the sub-ward in which they both lay. The patient who contracted the fever did not use the water-closet. Both the patients admitted with fever, and the one who contracted it in the hospital well attended by the same nurse. The patient recovered. One case of traumatic tetanus appears *cured* in forty-seven days with chloral hydrate.

In the surgical report, the first thing noticed is the very large proportion of deaths after thigh amputation—viz., seventy per cent. Two amputations at the hip-joint were performed during the year.

It is impossible to over-estimate the value of such reports as these—a value, however, we regret to say, not much appreciated. If more details were given, possibly hospital reports might be sought after by a larger number than at present.

AIDS TO BOTANY. (*b*)

The work of medical education actively engages the attention not only of teachers who consider themselves more or less responsible in the preparation of the student for his pass examinations and for the active duties of professional life; but also of those who, having passed through the trying ordeal and arrived at the goal of their ambition, are willing to offer to become finger-posts to point the way of success to those who follow. To secure this object men are found willing to devote their time and abilities in the preparation of "Manuals" and "Aids to Memory" on every subject required by either College, Hall, or University. Some months ago it was a pleasur-

(*a*) "London Hospital. The Medical Report for 1875." By Stephen Mackenzie, M.D., M.R.C.P., Medical Registrar and Assistant Physician to the Hospital. 1876.—"London Hospital. The Surgical Report for 1875." By Herbert W. Page, M.A., M.C. Cantab, F.R.C.S. Eng. 1876.

(*b*) "Aids to Botany." By C. E. Armand Semple, B.A., M.B. Cantab. M.R.C.P. London: Bailliére, Tindall, and Cox.

"Aids to Examinations." By W. Douglas Hemming, M.R.C.S. &c. London: Bailliére, Tindall, and Cox.

able duty to notice an excellent attempt in this direction, "The Student's Aid to Anatomy," by Mr. George Browne, and we are now called upon to direct particular attention to two companion waistcoat pocket volumes, in every way worthy of commendation.

Dr. C. E. Armand Semple's "Aids to Botany," aim at placing in a well arranged form the elementary facts of botanical science so that the student will find no difficulty if he chooses in committing the whole to memory and summoning them to his aid at the right moments.

Mr. Douglas Hemming's "Aids to Examinations" embraces a somewhat wider field of knowledge, it embraces Materia Medica, Medicine, Midwifery, Pathology and Forensic Medicine, in all of which the author presents at a glance examples of the questions put by the examining boards throughout the United Kingdom and the answer expected, according to the best authorities on the subject. It is well known that there are many students, who while they possess ample knowledge, find great difficulty in transferring that knowledge clearly and succinctly to paper and fail from this cause alone; for such, these little pocket companions are especially designed, and we are sure they will feel grateful that these useful and painstaking aids to memory have been printed and published.

Medical News.

Royal College of Physicians of London.—The following gentlemen were admitted licentiates of the College on February 21st:—

Richard Bevan, New Romney, Kent.
Samuel Henry Byam, 14 Milner Street, S.W.
Chas. Hamilton H. Cameron, Bethlem Hospital.
Chas. P. B. Clubbe, St. Bartholomew's Hospital.
Peter Cooper, 3 Tavistock Street, Bedford Square.
Cautley Dawson, Leeds.
Frederick S. Edwards, St. Mark's Hospital.
Henry Gorst, Royal Infirmary, Liverpool.
Frank Samuel Goulder, Woodbastwick, Norwich.
Delaware Lewis Irvine, Newcastle-on-Tyne.
George R. McDonagh, M.B., 139 Kennington Road.
Alfred Rees, Maesteg, Glamorganshire.
James W. Roughton, 1 Birkbeck Street, Norwood.
John Burton Rudduck, London Hospital.
Leader Henry Stevenson, Guy's Hospital.
Edmond Symonds, Thaxted.
Edward Beadon Turner, 9 Sussex Gardens, W.
Robert S. Tyrrell, M.B., 139 Kennington Road.
John Rheece Wynn Webb, St. George's Hospital.
Chas. H. White, Brathay House, Tufnell Park.

Indian Medical Service.—The Military Secretary, India Office, presents his compliments to the Editor of the MEDICAL PRESS and begs to enclose for publication a list of the candidates for Her Majesty's Indian Service who were successful at the competitive examination held at Burlington House on the 12th February, 1877. Forty-six candidates competed for 27 appointments. All were reported qualified.

Successful Treatment of Enlarged Spleen by Hypodermic Injections of Ergot.—Dr. J. J. Jones, jun., Little Rock, Arkansas, publishes the report of a very interesting case of this nature, which yielded to the hypodermic injection of ergot, when all other remedies had failed. (*M. S. Reporter*, Oct. 7th, 1876, page 291). The patient was a young man, æt. 58, unmarried, a native of Illinois. He was admitted into hospital, under Dr. Jones's care, June 29th, 1876, having suffered from intermittent fever, attended with enlargement of the spleen from the preceding January. The enlargement of the spleen is described as enormous. Notwithstanding a variety of remedies being diligently made trial of, the man's condition became critical in the extreme. "Bowels and urinary organs became complicated with general derangement;" œdema of the legs and feet, rapid emaciation and loss of appetite set in; dissolution seemed imminent. The subcutaneous injection of ergot having been suggested in the columns of the *Med. Surg. Reporter*, in answer to a query on the subject, the result may best be given in Dr. Jones's own words:—"Acting upon the suggestion, I began, on the morning of July 26th, and threw eight drops of Squibb's fluid extract of ergot under the skin, over the left lumbar region, continuing the constitutional treatment of iron, quinine, cod-liver oil, and whisky. To my complete surprise, I found the spleen on the next morning to have diminished at least six inches in circumference, and the patient greeted me with the expression, 'Doctor, my belly has gone down so much, it will wrinkle when I sit up." The œdema had disappeared from his feet and legs almost entirely, and the other complications began to subside at once. I used the ergot in the same manner five times, on successive days, with one or two intermissions, and to day, August 2nd, the patient is convalescing, with a respectably proportioned spleen. I consider him about well, and attribute it all to the use of the ergot."

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

J. B.—Applications for the office of Constabulary Medical Attendant should be made to the Inspector-General of Constabulary at Dublin Castle. All the regulations will be found in the "Irish Medical Directory." Usually the post is offered to the dispensary medical officer of the district and not given to another unless refused by him.

NUMEROUS Original Communications, Letters, and Notices of Books, &c., are again crowded out for want of space.

MR. R. SUMMERS.—With pleasure.

THE LATE SIR WM. FERGUSSON.—Those of our readers who wish to possess some little memento of this great surgeon will find threepence very well spent in the purchase of *The Pictorial World* of last Saturday, which contains a life-like engraving and an excellent biographical sketch of the deceased.

DR. S. G.—We do not know the price of the French edition: it is a rather thick volume of about a hundred plates and six hundred pages of text. Our correspondent will probably get the desired information of Messrs. Bailliére and Co.

MR. PHILLIPS should write at once to the medical officer of health in his neighbourhood, who is bound to see that the provisions of the Act are carried out.

SOCIETY OF ARTS.—We are asked to state that, in consequence of an unfortunate accident to Mr. Chas. W. Vincent, F.R.S.E., F.C.S., his lecture on "Spontaneous Combustion in Factories and Ships" is postponed.

Pathological Anatomy of the Brain

LOCALISATION IN CEREBRAL DISEASE.

By Prof. Charcot.

Chapter XV.

Gentlemen,—We must here make an important distinction; as we have already noticed, the symptoms will vary remarkably, according to the seat of the injury of the internal capsule.

If it affects any part whatever, in the anterior two-thirds of the capsule, the region where the white tract separates the anterior extremity of the lenticular nucleus from the head of the caudate, which region belongs, as you know, to the domain of the lenticulo-striate artery—paralysis will affect movement exclusively—no lasting trouble of sensibility will be present.

If, on the other hand, having invaded the domain of the lenticulo optic arteries, the lesion affects the posterior third of the capsule, in the part where this passes between the posterior end of the lenticular nucleus and the thalamus, the presence of cerebral hemi-anæsthesia will be, so to speak, a fatal event. Most frequently, the lesion occupying a mixed (or neutral) territory, the paralysis of sensation will be accompanied by a more or less well-marked motor paralysis. But it may happen that hemi-anæsthesia appears alone, as when the most receding parts, the most posterior parts of the internal capsule, are alone markedly affected.

I have now exclusively alluded to really *destructive* lesions of the internal capsule—in other words, those which by laceration, or necrosis, cause an irreparable loss of substance in these parts. It is important to distinguish this state of things from that in which the internal capsule is affected not directly, but as it were indirectly by the fact of its vicinity to a lesion confined to the grey nuclei surrounding it on all sides.

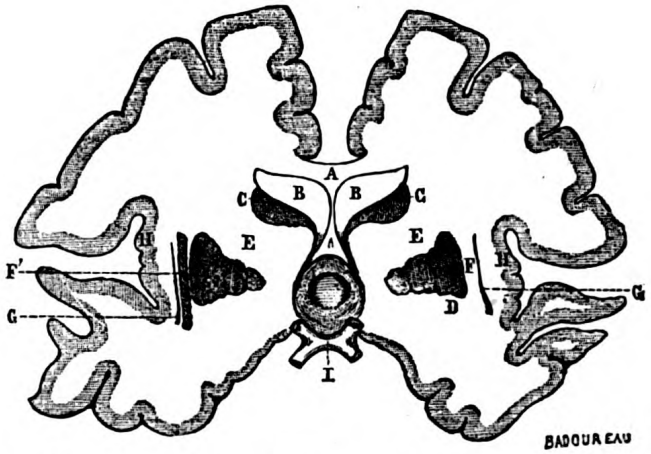
Thus the distension of one of these nuclei, in a case of interstitial hæmorrhage, might have the effect of compressing the nervous fasciculi composing the internal capsule, thus secondarily suspending the function of these fasciculi. But as, in such a case, the nervous fibres of the capsule are only compressed and not destroyed, the paralytic phenomena resulting from that compression (excepting of course, the presence of a tumour) must be quite transient.

The combination which I have just called your attention to, is frequently met with in cases of intra-cerebral hæmorrhages; it makes the interpretation of symptoms often very difficult. And if you are not aware of the difficulties you will be tempted, it has often been done, to trace the symptoms to destruction of the corpora striata or thalami—symptoms, which are uniformly the result of vicinage and of compression of the internal capsule. And to go further into the matter, let us suppose that we have to do with a clot in the "favourite spot," "lie d'election." The blood has been poured out, outside of the lenticular nucleus, in the place we have spoken of so many times, and the third segment of the nucleus (the putamen) has been partly broken up. I have told you how, in such a case, the outer boundary of the clot formed by the convolutions of the island of Reil, the "front wall," and the external capsule, resists the pressure of the mass of blood, while the grey nuclei are together turned inwards towards the ventricles.

It is clear that the structure of the internal capsule will be more be more or less severely compressed in consequence of such a change. Looking at it from the symptoms, two conditions may be regarded.

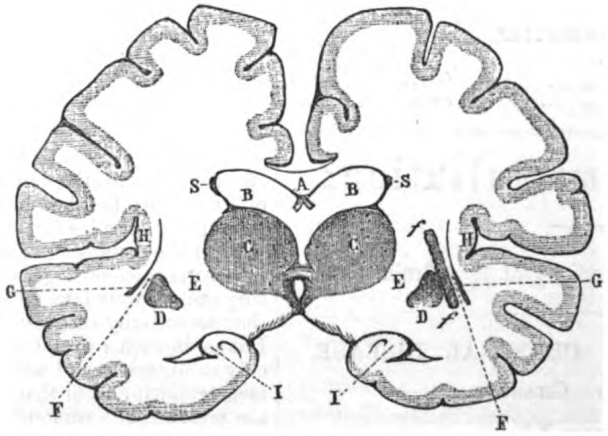
Sometimes the effusion is confined by those parts of the lenticular nucleus which correspond to the anterior half or two-thirds of this body, in other words to the domain of lenticulo-striate artery. Hence, *the anterior part of the internal capsule* will alone be affected, and that indirectly, by compression. The result will be a hemiplegia—exclu-

FIG. 14.



Extra-lenticular hæmorrhage (section behind the commissure) without hemianæsthesia.—A, Corpus Callosum; B, B, Lateral Ventricle; C, C, Caudate Nucleus; D, D, Lenticular Nucleus; E, E, Anterior or Lenticulo-Striate Region of the Internal Capsule; F, External Capsule; F', Hæmorrhage focus, having destroyed the External Capsule; G, G, Front Wall; H, H, Insula; I, Optic Commissure.

FIG. 15.



Extra-Lenticular Hæmorrhage at the level of the posterior part of the Optic Thalamus; Cerebral Hemianæsthesia.—A, Corpus Callosum; B, B, Cavity of the Lateral Ventricles; C, C, Optic Thalami; D, D, Lenticular Nucleus; E, E, *Posterior or Lenticulo-Optic Region of the Internal Capsule;* F, External Capsule; G, G, Front Wall; H, H, the Island; I, I, Cornu of Ammon and Sphenoidal Cornu of Lateral Ventricle; f, f, Extra-Lenticular Hæmorrhagic Focus incorporating above the Internal Capsule; S, S, Posterior Extremity of the Caudate Nucleus.

sively motor—affecting the *opposite side*. Sometimes, creeping further and farther backwards the clot will extend to the posterior limit of the lenticular nucleus, the compression then affecting the *posterior part of the internal capsule*, symptoms of hemi-anæsthesia will be added to the motor paralysis.

Such are the facts. Now to explain them. Having during life noticed the aforesaid symptoms (motor hemiplegia and hemi-anæsthesia), and *post-mortem* having found the existence of a clot in the lenticular nucleus, are you going to conclude from these facts that the lenticular nucleus has control over both sensation and voluntary movement in the opposite side of the body?

That would be an unfair conclusion, for supposing the patient recovered, the effusion being absorbed, and nothing remaining but a yellowish striate of cicatrix, the hemi-anæsthesia and motor paralysis would no doubt have disappeared without leaving any trace—in spite of the destruction of part of the lenticular nucleus. What I have said, gentlemen, of hæmorrhage in the lenticular nucleus applies equally to hæmorrhages into the substance of the posterior part of the thalamus. These effusions occur in consequence of the external posterior optic artery, one of the branches of the posterior cerebral. They are generally announced clinically by a more or less marked hemiplegia, but also, almost always, by more or less complete hemi-anæsthesia—supposing the clot to be of sufficient size. Must we then at once conclude, as so many authors continue to say, that the thalamus is the seat of common sensation? No, most assuredly; it would be easy to cite a number of cases where a lesion of the posterior part of the thalamus, brought about by an effusion of blood, after having caused troubles of sensation in the early period of the disease while the state of compression lasted, ceases to be accompanied by these symptoms in the later stages, when resorption of the clot having taken place, compression of the posterior part of the internal capsule no longer exists.

It is probably needless to insist longer on the fact that in regional diagnosis of affections of the central masses of the brain, the "situation is commanded" by involvement or non-involvement of the internal capsule.

IV.—These propositions, gentleman, have a great practical interest. They have been placed before you in the form of a "postulate" so to speak. They should be actu-

ally proved by regular demonstration, or in other words, the documents should be laid before you which constitute their basis in human pathology.

We ought to know the theory of the facts about which we are concerned, to penetrate, as far as possible, their anatomical and physiological *reason*. And to this end we must refer to the normal anatomy of the brain, to complete our investigations, almost for the last time, however.

In the preceding lesson, the important part in the pathology of the central masses, taken from lesions of the two great departments of the internal capsule has been fully shown to you. Herein we have justified some conclusions we have drawn, *apropos* of the anatomical constitution of this great tract. Now we must go further, and inquire what there is anatomically peculiar in the anterior or lenticulo-striate region of the capsule, as contrasted with the posterior or lenticulo-optic region whose lesion produces the syndrome of cerebral hemi-anæsthesia. Let us begin with this last point.

SOME PRACTICAL REMARKS ON AURAL AFFECTIONS.

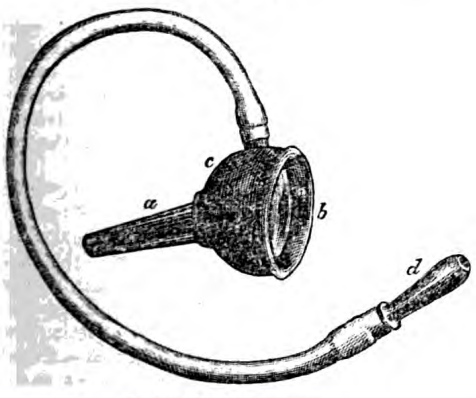
By H. Macnaughton Jones, M.D., M.Ch., F.R.C.S.I. and Edin.,

Surgeon to the Cork Ophthalmic and Aural Hospital, with Special Throat Department.

(*Continued from page* 141.)

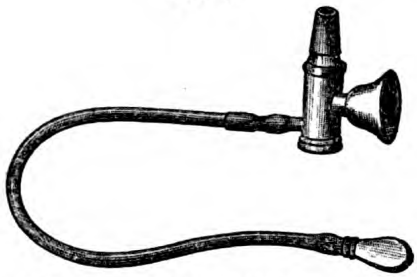
The mode of using the otoscope is simple. The patient is desired to shut his mouth, and at the same time to hold his nose firmly, and then to blow (not too forcibly), when the air is at once heard with a gentle rustle impinging against the membrane. The previous insertion of the speculum when this is done, will show the degree to which the patient can inflate the membrane. In the majority of cases we recognise the fact that air has impinged by an alteration in the shape of the membrane or any temporary obliteration of the triangular spot. But there are extremes of rigidity or flaccidity, in which it is hardly affected, or it is blown out bladder-like, and yields abnormally to the force of the entering current. We may get a peculiar moist gurgling sound of varying shades of intensity, denoting a moist state of the Eustachian tube, and probably an accumulation of mucus in the tympanic cavity. On the other hand, there is in many cases of old tympanic mischief a dry crackling sound, which accompanies that flaccidity of the membrane above-mentioned, and which I have found present in long standing cases of retained secretion. But familiarity with these various sounds is to be gained only from the constant use of the otoscope; they are to be learned not from description but from practice. Grüber has drawn attention to the relative value of the secondary sounds which we hear during the recoil of the membrane and ossicles, &c. Though aware of the occurrence of these sounds, I have not observed any further fact of practical importance in connection with them. For further determining the presence of adhesions of the membrane and the mobility of the malleus, the pneumatic speculum first introduced by Siegle is very valuable. It consists *vide* (Fig. 8) of an ordinary vulcanite speculum (*a*), which screws into a vulcanite box (*c*) covered with a glass lens (*d*), which is also screwed on. By placing a little piece of india-rubber tubing on the tubular part, it fits air-tight into the meatus. The box has an india-rubber tube and a mouth-piece (*a*) connected with it, which is placed in the mouth of the surgeon; suction is applied to the end of the tube, and the air drawn from the meatus, thus acting on the membrane, and with a good light thrown through the speculum this membrane is seen magnified, and any adhesions and inequalities which may exist are disclosed. I before referred to its existence in a diagnostic and a therapeutical point of view for the relief of tinnitus, a fact first dwelt on by Mr. Hinton.

Fig. 8.



Siegle's Speculum.

Fig. 9.



Morison's Speculum.—(Modification of Brunton's Auriscope).
(*Arnold and Son*).

Fig. 9 is a representation of Mr. Alexander Morison's speculum, a description of which, in his own words, I quote from the *British Medical Journal* of Dec. 22, 1876: "This is simply a miniature Brunton's speculum with an exhausting tube having an ivory mouth-piece attached. Near the point where the elastic tubing joins the speculum, there is a small valve which closes on respiration, thus preventing the breath from dimming the reflector. The advantage of this modification is, that, on account of the reflecting mirror in the speculum, and because of the observer looking directly on to the membrane through a lens placed parallel with the surface of the eye, the membrane can be more easily inspected than by direct light and through the obliquely placed eye-piece of Siegle's original speculum." But by far the most valuable means of ascertaining the condition of the membrane and the Eustachian tube, is that devised by Dr. Politzer. A bag, such as the one to be represented in a future paper is furnished with a valve at the bottom. This, or the douche of Mr. Lennox Browne, is held in the right hand; the patient is given a little water to keep in the mouth, and he is directed to swallow the fluid, immediately on his being called on to do so. The surgeon then introduces the india-rubber tubing attached to the nozzle of the bag into the floor of the nostril, and firmly closes with the forefinger and thumb of the disengaged hand both nostrils. When the patient is called on, or a signal is made to him to swallow, he does so, and immediately, *during the act*, the air is expelled from the bag, and it rushes into the ears. There is no difficulty whatever in carrying out this simple manœuvre, and even children get quite accustomed to the inflation if in the beginning they are taken gently and gradually are taught. Mr. Dalby recommends for children the use of an india-rubber tube "with a mouth-piece at one end and a nozzle at the other," and he blows through the tube as they swallow. Figure 10 represents another variety of Dr. Politzer's bag; it is furnished with a tube and two nose pieces. This the patient can use himself, and by it we avoid the unpleasantness of pushing

the tube into the nostrils. The douche that I generally, of late, give to patients to use themselves is that repre-

Fig. 10.

Fig. 11.

L. Browne's Air Douche.

sented in Figure 11, but I prefer the plain Politzer bag, to any other form for my personal use. These instruments may be obtained of Messrs. Khrone and Seseman, Duke Street, Manchester Square.

Clinical Records.

ST. MARY'S HOSPITAL.

Twelve Cases of Rheumatic Fever treated with Salicylic Acid.

Under the care of Dr. Handfield Jones, F.R.C.P., and Dr. Cheadle, F.R.C.P.

Reported by Mr. J. Swain Scriven, L.S.A.

(*Continued from page* 163.)

Case 9.—Female, æt. 18, servant.

1st day.—Temp. 102. Much erythema in ankles. Ac. salicyl., gr. xx., every hour for six hours.

2nd.—Temp. 100. Pains decreased.

3rd.—Temp. normal. Great swelling of joints; erythema gone. Ac. salicyl., grs. xx., every six hours, daily.

4th.—Pains variable.

5th.—Medicine makes her feel sick.

8th.—Omit ac. salicyl.

9th to 34th.—Pains variable. Temp. normal.

Had rheumatic fever four years ago. Heart sounds clear; no albuminuria. Salicylic acid caused nausea and deafness. The pains, though not severe, were very persistent; but this can be accounted for by the conduct of the patient, who took a great dislike to the medicine, and acknowledged that she kept it in her mouth after it was given her till the nurse turned away, when she spat it out. She would also get out of bed whenever she had a chance, and run about the ward; and when hot in bed, throw off the coverings and the flannel which she was ordered to wear over her shoulders when in bed. In spite of all this the temp. remained normal, though pains and swelling remained, with various degrees of intensity, for some time. Discharged on the thirty-sixth day, cured.

Case 10.—Female, æt. 16. Father, stationer.

1st day.—Temp. 103. Ac. salicyl., gr. xv., every hour for six hours.

2nd.—Temp. normal. No pain.

History good. Heart sounds clear; no albuminuria; no deafness. Pains in lower limbs yielded at once to treatment; only six doses necessary. Joints remained stiff for some days. Discharged sixteenth day, cured.

Case 11.—Male, æt. 30, postman.

1st day.—Temp. 100; pulse 100. Ac. salicyl., gr. xx., every hour for six hours. Temp. after six doses, 100.

2nd.—Temp. 99. Less pain.

3rd.—Temp. 99. No pain. Omit salicylic acid.

4th.—Temp. normal. Some pains. Ferri et quiniæ cit., gr. v., mist. pot. cit., ℥j., t. d. s.

19th.—Pains diminished gradually, and none now.

History good. Does not drink much. Temp. and pain yielded quickly to acid, but pains returned. Temp. did not again go up, and pains ceased after a time. Heart-sounds clear. No albuminuria. Discharged twenty-first day, cured.

Case 12.—Female, æt. 36, husband labourer.

1st day.—Temp. 99. Great pain. Ac. salicyl., gr. xx., every hour for six hours daily.

2nd.—Temperature normal. Pains less.

3rd.—Reduce ac. salicyl. to gr. xx. every hour for three doses, daily.

5th.—Pains gradually less, and now ceased.

History good. Heart sounds clear. No albuminuria. Medicine induced deafness. Pain yielded at once to the remedy, and never returned. Discharged cured eleventh day.

The principal deductions to be drawn from the foregoing cases are as follows:—

1. Salicylic acid though not a "specific" is a most valuable remedy in cases of rheumatic fever.

2. The bowels should be well open before the treatment is commenced.

3. It is best given in water, combined with an equal quantity of carbonate of soda. The addition of tinct. aurantii makes it more palatable; when given as a powder it is very disagreeable to the palate.

4. It generally produces deafness, which however is only temporary, passing off as the drug is eliminated from the system.

5. It may sometimes produce irritation of the stomach, causing nausea and sickness, and to such an extent as to render its use in some cases impracticable, but this does not often occur.

6. Its effects appear not so good where there is a syphilitic history, such patients among the above not being so amenable to the treatment as the others.

7. The production of deafness and nausea is apparently not modified by the presence of extreme pain, nor by a high degree of temperature.

8. It is advisable to continue the use of the drug after the temperature has been reduced to normal, though the doses should be smaller, and administered less frequently, as if discontinued too soon a relapse is likely to occur. Dr. Handfield Jones is, however, of opinion that it is best to leave off the remedy as soon as defervescence takes place, and if needful, give it again on a return of the pains or high temperature.

9. Salicylic acid probably lessens the tendency to pericarditis and endocarditis; as of the twelve foregoing cases, excluding one, Case 6, in which there was marked morbus cordis on admission, there were only two that had any murmur, viz., Case 7, murmur heard on the fourth day, which ceased on the sixth, and Case 8, murmur heard on the third day, and ceased on the ninth. Both cases had feeble hearts on admission. In one other case, Case 3, the first sound of the heart was slightly prolonged on a single day, the eleventh after admission; and it is also noteworthy that though Case 5 was admitted with a very weak heart, there was no murmur throughout.

Transactions of Societies.

SURGICAL SOCIETY OF IRELAND.

THE Sixth Meeting of the Session was held on Friday evening, Feb. 16, the President of the College, Dr. G. H. KIDD, in the Chair.

EXTENSIVE HIP-JOINT DISEASE.

Mr. COLLINS said the specimen he exhibited to the Society was removed by the operation of excision of the hip-joint from a little girl six years old. She had suffered from the disease for more than a year and a-half. Shortly before the time of of her admission to hospital, four months since, an abscess opened of itself 3½ inches below the anterior inferior spine of the ilium. The suppuration gradually wore the patient down, and she was beginning to succumb to hectic, small pieces of bone coming away from time to time in the discharge, but he was unable to touch diseased bone with the probe, for he examined it carefully, and so also did many of his colleagues on various occasions. That fact was owing to the tortuous nature of the sinuses. The ordinary silver probe was not only used, but he used also the probe that Mr. Sayre, of New York, particularly recommended. However, evidence of the diseased bone could not be obtained; but from the pieces of bone coming away, and the child's health giving way, he determined on performing the operation of excising the hip-joint. He found the upper portion of the femur diseased; the head was gone, and epiphysis also; and there was only a small stump representing the neck of the bone. Though the bone appeared healthy immediately below the neck, he removed it, as Mr. Sayre and he (Mr. Collins) believed all the best surgeons who had written on this disease recommended, below the great trochanter, and immediately above the lesser trochanter, and he thought the case was interesting as showing the advisability of doing that, because, though the bone appeared tolerably healthy externally immediately below the place from which the head and neck had been absorbed, still, on making a section of the bone, there was very extensive disease manifest, passing down almost to the limit of the incision. Whether that was tuberculous matter or simply pus he did not say; at all events, there was evidence that the bone was in a state of death to within a short distance of where he sawed the bone. The acetabulum was very extensively diseased; it was carious and perforated. He was able to pass his index finger from the bottom of the acetabulum, and could feel the soft structures lining the pelvis. The patient was going on remarkably well since the operation; she had less fever now than before, and every morning since the operation the temperature has simply been 99¼.

OVARIAN TUMOUR.

Dr. LOMBE ATTHILL exhibited a recent specimen to the Society which he said was, in his opinion, one of great interest, and exceedingly instructive. It was a large ovarian tumour, which had been removed from the body of a woman who died in the Rotundo Hospital on the previous day. She was admitted to hospital about three weeks ago. Her history was this:—She was married for many years, but never had been pregnant; she was about 43 or 44 years of age, and had enjoyed excellent health up till about May last, up to which date menstruation had regularly taken place; at that date, however, the menses ceased, but without any apparent derangement of her general health, and the flow never returned. A short time afterwards the abdomen commenced to enlarge, and continued rapidly to increase in size until about six weeks ago, when it had become so large that she consulted a local practitioner. He at first thought she was pregnant, but subsequently decided that it was an ovarian tumour, and tapped her, but no fluid was drawn away. She then sought admission to the Rotundo Hospital, and came under Dr. Atthill's care three or four weeks ago. The abdomen then measured round the umbilicus about 42 inches. There was universal dulness on percussion over the whole of the abdomen except in the region of the epigastrium, and also low down in the flanks on the inner side. Indistinct fluctuation could be felt about the umbilicus, and at a point above the umbilicus in a very indistinct degree. The uterus was of normal size. A tumour could be felt distinctly posterior to the uterus. This tumour was evidently distinct from the uterus, but whether it was part of the tumour above was not clear. He came to the conclusion that the woman was the subject of a multilocular ovarian cyst, and that there was a very large quantity of solid matter in the tumour. He therefore considered, from the great size of the woman, the rapidity of growth of the tumour, from the fact that her health had failed very much, and the great œdema of the lower extremities, that the case was a very unfavourable one for operative interference. During the three weeks she was in hospital her abdomen increased in circumference two and a-half inches. She then suffered from dyspnœa, was obliged to sit up in bed at night, and the œdema greatly increased. Ultimately she was tapped, and about three quarts of rather thick fluid drawn off. She expressed herself as greatly relieved by that operation, and on that night she slept. The next day she was cheerful and well, but on Tuesday she began to complain, and that night she was very restless, and notwithstanding the fact that the hypodermic injection of morphia was used, she hardly slept at all. On the day following there were well marked symptoms of peritonitis, incessant vomiting set in, she sank rapidly, and died 24 hours after, the peritonitis lasting only 30 hours. On making a section of the abdomen there were well marked symptoms of peritonitis, and the abdomen contained a large quantity of semi-purulent fluid. The cyst removed was found to weigh over forty pounds; it had not yet been opened, but it was quite evident that the diagnosis was a correct one, for the tumour was large and multilocular, containing a considerable amount of solid matter. Next to the tumour was a large projection into the posterior *cul-de-sac* of the peritoneum, and it caused some doubt as to whether it was a distinct fibroid or some portion of the tumour above. It was evidently distinct from the uterus, and detached from it, and on feeling it we felt confident that it was a fibroid tumour, and so it had proved to be. Looking at the result of the tapping and the general condition of the woman, there could be no doubt that the decision not to interfere was in the case a wise one. The woman would have died had they performed ovariotomy, and her death would have been made use of by those few opponents who now exist to the operation as an argument in favour of the unjustifiability of an operation which is now so frequently resorted to. In conclusion, he might add that there were no adhesions.

Literature.

BENTLEY & TRIMEN'S MEDICINAL PLANTS. (*a*)

WE have already had occasion to draw the attention of our readers to this valuable and much needed work which is now in course of publication. Several parts have been issued since our last notice, and, therefore, we shall again renew our acquaintance with it.

The work consists of original coloured illustrations, natural size, with accompanying descriptive text of the plants which yield the drugs in common use. The British Pharmacopœia has been the chief guide in the selection of the plants to be delineated, but many will be found which, although not officinal here, are included in the Pharmacopœia of the United States or in that of India. The work will thus serve as an illustrated botanical guide to the British, United States, and Indian Pharmacopœias. Plants also which are employed in different parts of Europe, or which are used as food, are also described.

The letterpress is, as we have remarked on a previous occasion, a valuable part of the publication. We need not say that the chief portion of the letterpress is taken up with a full account of the botanical character and natural history of the plants illustrated, but this is followed by a succinct description of the composition, medical properties, and uses of the officinal parts of each plant.

The last five parts which have appeared are equal, both in the execution of the plates and in the descriptive text, to any of those previously published. Among the plants most commonly known we have in these parts excellent

(*a*) "Medicinal Plants, being Descriptions with Original Figures of the Principal Plants employed in Medicine, and An Account of their Properties and Uses." By Robert Bentley, F.L.S., &c., &c., and Henry Trimen, M.B., F.L.S. J. & A. Churchill. 1875—6.

delineations of Rosa gallica, Daphne Mezereum, Pinus sylvestris, Aconitum Napellus, Strychnos Nux vomica, Ecbalium Elaterium, Convolvulus Scammonia, Eucalyptus Globulus, Cephaælis Ipecacuanha, and Rheum officinale. Among plants less commonly known we have : Tinospora cordifolia, or Gulancha (Hindustani) a plant which is much used in India as a bitter tonic and antiperiodic. Erythroxylon coca, or coca, the leaves of which have been long used by the Indians as a stimulant and restorative, and to the chewing of which it was recently said that Weston owed his great success as a pedestrian. Its action appears to resemble that of tea, but recent inquiries would seem to show that its therapeutical properties are of a very mild or doubtful nature.

In conclusion, we may observe that to the student this will be a very valuable work of reference especially in preparing for his examinations ; while it will form a handsome and valuable addition to the library of every medical man. It is certainly a rather costly publication, but then it is to be remembered that it will be a standard work for many years to come, and not like most other medical works superseded by a new edition, or by some other medical work of the same kind.

Medico-Parliamentary.

MEDICAL PROMOTION IN THE NAVY.

On Friday last, in the House of Commons,

Captain Pim asked the First Lord of the Admiralty if the three medical officers who were promoted from the late Arctic Expedition were so promoted on the recommendation of the Director-General of the Medical Department of the Navy, and if so, whether any reference was made to that officer before such promotions were made, and why Fleet-Surgeon Nolan was not included in these promotions, and if it was his intention to bestow any reward upon that meritorious officer.

Mr. Ward Hunt.—I am sorry that I must decline, on general principles, to satisfy the curiosity of the gallant member. Promotions in the navy are made upon the responsibility of the First Lord, after consultation with his colleagues. The latter part of the question seems to imply a grievance. The promotion of surgeons was limited to a small number by the order in council, and no promotion takes place unless there is a vacancy.

THE SANITARY STATE OF THE WAR OFFICE.

Mr. Noel, in reply to Mr. Kay-Shuttleworth, said that plans and estimates were being prepared to carry out the expenses to be incurred in accordance with the report of the commissioners as to the sanitary state of the War Office. When they were ready they would be immediately sent to the Treasury for their sanction and approval, when every effort would be made to carry out the work as speedily as possible. The erection of a new War Office would be a very formidable undertaking, and he was unable to state whether her Majesty's Government had any scheme under consideration for the erection of a War Office.

A miser died last week at Woolwich at the advanced age of 86, leaving property to the value of £30,000 to £40,000. Of this sum a lucky member of our profession, Dr. Halifax, of Brighton, comes in for a legacy of £5,000, and local charities also are included in the will. The strangest part of the affair is that the deceased, who for nearly half a century had lived in the utmost seclusion, and denied himself the common necessaries of life, eating only when driven to it by sheer hunger, and then only the smallest possible quantity of the cheapest commodity, should have lived to such an age.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, MARCH 7, 1877.

VISCERAL SYPHILIS.—II.

Many of the specimens exhibited in illustration of true or supposed syphilitic affection of the lungs were of great interest, and all the more so, from the fact that a little mystery still surrounds the real nature of some of these growths. Speaking generally, the lesions to which we now propose to draw the reader's attention, may be divided into those which are undoubtedly syphilitic, and those respecting whose pathogeny there is much difference of opinion.

Gummata, or what had all the appearance of gummata, were shown by Drs. Gowers, Green, Aitkin, and others. One of Dr. Gowers was a syphilitic nodule from a patient who also presented two gummata in the cerebellum. It was only one-third of an inch in diameter, ill-defined, and caseous at several points. It consisted of a small, round-celled growth, partly around the vessels, and infiltrating the walls of the air-cells, which were filled with a mixture of new growth and inflammatory products. Histologically, it was not possible to distinguish it from tubercle. Dr. Green showed a specimen of what he considered to be a form of gumma taken from a young man, who had also a well marked gumma in the liver. It consisted of a mass of induration, of the size of a small orange, passing gradually into the surrounding tissue, very fibrous, of a greyish-red colour, and the microscopical sections of which presented the ordinary appearances of syphilitic, small-celled growths. The peculiar naked-eye characters of the specimens, and the presence of a gumma in the liver was, in the opinion of the exhibitor, a strong confirmation of its syphilitic nature. Three specimens of gummata of the lung were also amongst those that were taken from the museum of the hospital at Netley ; but on the whole the number of gummata exhibited was not in proportion to

the frequency with which they are supposed to occur in the lungs. The attention of the Society was more attracted to certain fibroid changes, which were considered to be of a very suspicious character, when found in connection with a syphilitic history. One of the first specimens of this sort was shown by Dr. Greenfield. It was found in the lower lobes of the right and left lung, and consisted of fibrous bands passing from the pleura inwards, along the course of the vessels, and producing contraction and puckering of the pleura. Another specimen of the same kind was shown, and both of them closely resembled one previously exhibited by Dr. Payne.

At the second meeting of the Society, Dr. Goodhart exhibited microscopical sections and drawings of a fibroid form of pulmonary syphilis, taken from four cases in whom a syphilitic history was well established. The naked eye appearance of these growths was remarkably characteristic of syphilis. They were prominently fibrous, and not tubercular; they were seated at the base or root of the lung, and not at the apex; they were associated with marked puckerings of the pleura; they were symmetrical, and not unilateral, and they led rather to gangrene than to molecular or cheesy changes. But in their minute structure they did not differ from those of the more chronic forms of tubercular phthisis, or chronic pneumonia. They consisted of thickening of the lobular septa, coats of the vessels and bronchi, with dilatation of the latter, the fibrous septa being in places crowded with small cells and nuclei, growing between the alveoli. The extreme vascularity of the new tissue, however, was a point of importance, and was probably, observed Dr. Goodhart, the source of hæmoptysis in fibroid phthisis. In the complications of morbid lesions found in the case of syphilis, brought forward by Dr. Pye-Smith, disease of the lung was a prominent feature. There was no tubercle to be found in any part of the body, but a large amount of visceral syphilis. There was a single fibrous nodule in the lower lobe of the right lung; while the left lung was the seat of more or less consolidation, which was firm and grey, and traversed by dilated tubes. It was a form of chronic interstitial pneumonia consisting of a fibro-nuclear growth, with numerous small vessels, abundant fibro-cicatricial tissue and bronchiectasis, and appeared to arise from a chronic contracting peribronchitis. But there were no tubercles, caseous change of any kind, affection of the glands, or peribronchial tubercles, or stuffing of the alveoli with catarrhal cells.

Before analysing the evidence in favour of or against the syphilitic nature of all the specimens that were exhibited at the society, it remains for us to notice the chief points in connection with syphilitic affections of the *Brain and its Membranes*.

Of the twenty-two cases of syphilitic disease examined after death by Dr. Greenfield, two died from gummata in the brain and dura mater, but it must be borne in mind that in this statement we are excluding those cases (from the same category) of diseased cerebral arteries to which we have already drawn attention. The two specimens exhibited by Dr. Gowers were very instructive ones. In one of syphiloma of the brain the growth sprang from the dura mater, involved the pia mater, and invaded the brain tissue by several processes, which surrounded the blood-vessels, and branched out into the substance of the convolution. This mode of extension of cerebral syphilomata was, remarked Dr. Gowers, long ago pointed out by Virchow, and he believed all apparently intra-cranial gummata sprang from processes of pia mater between the convolutions. The other specimens consisted of two nodules growing from the dura mater, composed of rounded nucleated cells, 1-2,000th to 1-3,000th of an inch in diameter, with a few fusiform cells, and a delicate fibrillary stroma. Again, in the interesting case related by Mr. Hutchinson, the real nature of which was not recognised till after death, the skull was found very thick and hard, its dura mater adherent in patches, and in the pia mater indenting the convolutions, which were also implicated; there were a number of dense, pinkish-white lumps, or small gummata. Dr. Sutton also exhibited a drawing of syphiloma of the brain, in which the new growth or node, springing from the inner surface of the parietal bone, involved the membranes of the cortical substance of the subjacent convolutions, while the left optic, and the left third and right sixth nerves were surrounded by a greyish material. The dura mater was adherent to the brain in the left hemisphere, and the outline of the convolutions was lost. Nor did the membranes of the brain escape implication in the many visceral changes found in the case adduced by Dr. Pye-Smith. There was a patch of caries of the frontal bone in the middle line, to which the dura mater was adherent, and from this point a thick vascular condyloma of the membrane adhered to the brain over the first and second frontal convolutions. In one of the specimens showed by Dr. Gowers both the brain and the spinal cord were the seat of syphilitic growths. There were old thickenings around left fifths nerve-roots and ganglion, as well as around the third, fourth, and sixth nerves. There was an old gumma in the position of the fundibulum, and a recent growth in the left crus, which extended to the case of the optic thalamus. The lower cervical region of the cord was also the seat of two recent growths, one of which was so large as to occupy half its area in the posterior and left portion of the cord. The growth beneath the optic thalamus was found to be continuous along the crus, with a small growth close to the surface of the pons, beneath the induration around the fifth nerve. Lastly, we have to notice two specimens from the hospital at Netley, one of a gumma the size of a walnut, seated below the extra-ventricular part of the corpus striatum. The other one in which the calvaria was diseased and adherent to the dura mater, while the anterior lobe of one cerebral hemisphere was softened, and the seat of two gummata, with softening of the central ganglia also.

We need scarcely remark that specimens of visceral syphilis occurring in other viscera than those above-mentioned were shown at the last three meetings of the Pathological Society. There were to be seen syphilitic lesions of the liver, of the spleen, of the testis, and other parts, but as these in a clinical point of view yield in interest to those which attack the arteries, the brain, or the lungs, we need not draw particular attention to them. As we mentioned in the case of disease of the arteries, so also with respect to syphilitic affections of the brain or the lungs, the history of the cases which furnished the specimens showed what great importance is to be attached to such

affections when viewed in their clinical bearings, especially their diagnosis and treatment.

An isolated gumma in the lung may have little or no effect upon the health unless it be of large size; while those more extensive fibroid changes of the lung that have been found in connection with syphilis were usually accompanied by all the physical signs and general symptoms of chronic phthisis. Still more alarming and often more rapidly fatal, were the phenomena arising from the presence of gummata and periosteal thickenings. The scope of these articles will not allow us to do more now than very briefly refer to them. Suffice it to say that constant headache, severe pains in the head, various forms of local or partial paralysis, dimness or loss of vision, intolerance of light, strabismus and other ocular derangements, various forms of eclampsia or even epileptic convulsions, and great mental irritability are among the more prominent symptoms observed in these cases.

We have now given a brief account of the main facts which have been recently brought before the notice of the Pathological Society with regard to a very important subject, and it will only remain for us to consider what light these discussions have thrown upon our knowledge of the real extent and prevalence of visceral syphilis, the lessons to be learnt from them, and in what direction it seems desirable to prosecute future inquiries.

THE SATURDAY REVIEW ON "MAD DOCTORS."

The Saturday Reviler, true to its natural malignity, is indignant and vituperative because a miserable and diseased youth has escaped the gallows. In an article last Saturday, headed, "The Mad Doctors Again," it pours forth the vials of its wrath because the convict Treadaway has not been hanged. Now, a friendly feeling towards Mr. Marwood and a desire for his prosperity are all very well, but they ought not to lead a journal with pretensions to respectability and intelligence into applying a foolish and offensive nickname to a body of able and honourable professional men. A zeal for the interests of justice is commendable, but it ought not to betray a smart writer into egregious blunders and misrepresentations. And we regret to say that in the article with the courteous title which we have just quoted the blunders and misrepresentations are egregious. Dr. Hughes Bennett, who has never had any connection with lunacy practice, is called a "mad doctor;" Dr. Rhys Williams is named Dr. Reece Williams; Mr. Richards, one of the medical superintendents of Hanwell Asylum, is spoken of as the surgeon of the Clerkenwell House of Detention, which he never was, and is said to have had Treadaway under his care, which he never had. The inquiry, subsequent to the trial, into the convict's mental condition is said to have been conducted by certain "unknown persons," whereas, the names of the medical assessors called in, Dr. Rislon Bennett and Dr. Crichton Browne, were published in every metropolitan newspaper. The convict is said to have purchased the pistol on the day of the murder, the fact being that he bought it the day before; he is said to have run up the area-steps after his assault on Mrs. Collins, the fact being that he went back into the house, up the stairs, and let himself out by the front door. And lastly, he is said to have been declared irresponsible for his actions when he has just been sent to penal servitude for life. The motto of the smart writers of *The Saturday* is evidently "Perish accuracy of statement."

The convict Treadaway had a seizure in court, which turned out on inquiry to have been a genuine epileptic fit. It further appears that during the last few years he has had several other fits of a similar nature. Those who know anything of the devastating effects of epilepsy upon the intelligence, and of the sudden and transitory outbreak of violent excitement that it frequently induces, will be inclined to think that there may be truth in the statement which he has undeviatingly made since his arrest, that statement being that he had some kind of seizure immediately before the murder, and that he has no recollection of anything that occurred until he came to himself at a considerable distance from the scene of the tragedy. They will, at any rate, be satisfied that the Home Secretary has acted with wisdom and humanity in remitting the capital sentence in a case in which, even if a wilful murder was committed the culprit's powers of self-restraint were almost certainly weakened by a terrible disease, the very essence of which is a violent interruption of consciousness, and the almost inevitable consequence of which is complete mental decay.

We are not in the confidence of the Home Office, but it seems to us not improbable that another consideration weighed with Mr. Cross in respiting Treadaway. The convict had two fits when the charge against him was undergoing examination at the Westminster Police Court, and he had a very severe fit when on his trial at the Old Bailey, the latter having been brought on by his hearing the young woman to whom he had been engaged to be married sobbing near him. It is clear that any intense emotion would bring on another fit. Now it might heighten the grim gratification of *The Saturday Reviler* at the vindication of the law that a convict should have a fit on the scaffold and should be strangled whenever the convulsions had subsided, or that he should be carried from his cell and hanged when just recovering from an attack of one of the most grievous visitations that flesh is heir to. But the British public is not yet sufficiently enlightened to desire such an exhibition, which would, indeed, have anything but a salutary effect; for surely, more harm than good is done whenever punishment is of such a nature that detestation of the crime is swallowed up in pity for the criminal. Had Treadaway been left for execution, and had a painful scene occurred on the scaffold, that stern censor, *The Saturday Reviler*, might perhaps have had something to say about the ignorance and inefficiency of "mad doctors" in failing to foresee and avert such an outrage.

THE DISFRANCHISEMENT OF THE "LEDWICH" SCHOOL BY THE UNIVERSITY OF DUBLIN.

It will readily be understood that the announcement that one of the leading Irish schools has been disfranchised by the Board of Trinity College was received not only with interest but with excitement by the profession. That excitement has been increased rather than abated since we recorded the fact in our last issue, by the know-

ledge of the circumstances under which the disfranchisement took place, and the confirmation of the decision of the Board by the voice of the Academic Council. We publish elsewhere a complete statement of the case of Mr. Ledwich, in which the whole correspondence preceding the transaction is set out, and the profession are in a position to judge for themselves of the position taken by Trinity College. For ourselves we think it right to say that—while we adhere to a warm approval of any steps taken by the University to purify the Irish medico-educational system from the stain of the sham-certificate arrangement—we consider that, in their recent action against the Ledwich School, the Board has committed a great mistake; and that the Academic Council has been guilty of more than one error in confirming that mistake after it had been made plain to them.

The correspondence will show our readers that the "Ledwich" School has been refused entry to Dublin University not because it issued fraudulent certificates, or certificates which might be open to the suspicion of fraud, but because a surgeon of Mercer's Hospital, who happens to be a part proprietor of the School, gave an irregular certificate of the attendance of a student at the hospital.

The University of Dublin grants to medical students exemption from certain parts of their Arts course, to secure which privilege it is necessary to produce to the senior lecturer evidence of their being engaged in medical study. For this purpose Mr. Ledwich gave to a student a printed card in which it was stated that A. B. "had diligently attended the course of clinical lectures in Mercer's Hospital during the session commencing in October 1876, and ending in April 1877."

Inasmuch as the session has not terminated, and as, moreover, Mr. Ledwich had dated the card in January, 1877, it must be quite evident that no misrepresentation could have been intended, and that the certificate, though badly worded, and, in fact, quite irregular, was nothing more than the usual *testimonium* that the student was in course of study for the period stated therein. Upon the ground of such blunder in wording it would have been entirely unjustifiable, we think, to disfranchise any teaching institution—how much less reasonable does the act of Trinity College apppear when it is recollected that the institution disfranchised is not the hospital which gave the certificate, but a school whose connection with the hospital is purely casual and unofficial. From the fact of the connection of Messrs. Ledwich and Mason with both institutions, and from their contiguity of situation, Mercer's Hospital happens to be frequented largely by Ledwich students, who are, however, received at the hospital just as those of any other school would be, and with no special privilege whatever. Others of the hospital staff are connected by examinership and teachership with the College of Surgeons and with the Carmichael School, and yet no one thinks of suggesting that Mercer's and these latter institutions are mutually responsible for each others acts. This aspect of the matter seems so plain that we imagine that the Board must have acted without reference to their medical registrar, or to any medical man who could have made them aware of the relation of the hospital to the school, and they seem to have fallen into confusion of mind on the subject, and thus made the school to suffer for the act of one of its members, done on behalf of Mercer's Hospital. If they have thus fallen into error, they may be somewhat excused, although an influential public board is eminently open to censure when it takes such steps without close inquiry; but what is to be said of the Academic Council, which deliberately repeated the mistake with its eyes open. Its act does not deserve to be called a mistake—it is an indefensible act of despotic authority, and, as such, will have no apologists.

If any hospital or school gives fraudulent certificates, the course is plain before the University, and all who honour straightforward dealing will approve and support it in disfranchising such an institution; but neither the Board of Trinity College nor any other administrative council can be supported when it condemns a school without clear evidence against it, or when it exercises its arbitrary power of disfranchisement upon no better ground than indefinite professional rumour.

The University of Dublin has been signally at fault, and if it were to do justice to its high reputation it would not hesitate to rescind an act which not even the greatest stickler for purism of certificates can approve.

THE PROPOSED AMENDMENT OF THE VACCINATION ACT.

A LONG letter from our correspondent, Mr. Boddy, and an excellent leader in last Saturday's *Daily Telegraph*, remind us that the attention of the House of Commons will shortly be called to a Bill the purpose of which is to amend the law relating to vaccination so far as accumulating penalties are concerned.

It is gratifying to know that the opinion of the profession on the subject of compulsory vaccination, and the principle and working of the Vaccination Act, have been always strongly supported by the daily press, and we are glad to see that the opponents of vaccination receive no quarter from the writer of the article above mentioned, and that no countenance is given to any measure that would weaken the operation of the Act. The amendment which Mr. Pease has this Session introduced amounts to this:—"That it be enacted that no parent shall be liable to be convicted a second time for neglecting to have his child vaccinated, and that he is not to be prosecuted if either he has been previously adjudged to pay a penalty of twenty shillings for any offence under the acts, or if he has been previously twice adjudged to pay any penalty less than that just mentioned." Very little reflection is required to see that were this proposed amendment to become law, it would totally defeat the very object for which the Vaccination Acts were framed. We are, therefore, not surprised that the *Daily Telegraph* at once perceives the absurdity of introducing such a clause as that to which Mr. Pease, Mr. Mundella, and others, will ask the House to give its serious attention As that paper justly observed, the offence contemplated by the Acts is not refusing to have a child vaccinated, but having a child in an unvaccinated condition. "If a child is unvaccinated on the 1st of February an offence is committed, but a second offence is committed if it is not vaccinated on the 1st of March." Or to put it in another way, the Vaccination Act is essentially a com-

pulsory one. Its object is not to persuade, nor to permit, but to compel every parent to have his child vaccinated within a certain period from its birth. But what compulsion would there be if parents were to do as they liked after they had been once prosecuted and had paid their penalty of twenty shillings. The Acts would be perfectly stultified and rendered useless by such a clause as that proposed, while the performance of the operation would be continually opposed by the caprice and prejudices of the public. In fact, the proposed amendment is so absurd on the face of it that we have not the least fear it will ever become law, although we believe that Mr. Sclater Booth is of opinion that some alteration in the Act is desirable. A few months ago, the honourable member thought it would be well if some relaxation could be made with respect to the repeated prosecution of those who could not have their children vaccinated, provided that such relaxation could be made without weakening the general force, or defeating the great object of these Acts. It is clear, however, that if vaccination is to be thoroughly and universally carried out, any amendment that may be made must be in a very different direction to that proposed by Mr. Pease, and this consideration brings us to the letter of Mr. Boddy, which appeared in our last issue.

In the first place we think our correspondent is much mistaken in supposing that the clause of the Vaccination Act which relates to the fines and penalties has actually had the effect of fostering small-pox, and "that the present outbreak of this disease may be justly ascribed to the bad working of the Act originating from this clause." The opponents of vaccination who have successfully evaded the law and the unvaccinated children are so few when compared with those who have complied with the law, that the occurrence of small-pox epidemics cannot be reasonably ascribed to the cause above mentioned. The result of the inquiry made more than five years ago by a select Committee of the House of Commons was to show that 95 per cent. of each year's registered births are finally accounted for on the vaccination registers, while the small percentage remaining is satisfactorily disposed of on otner grounds than that of the objection of parents. In 1874, in which upwards of 700,000 children were "successfully" vaccinated, only 749 summonses were issued, and in a large proportion of these the proceedings were little more than nominal. We cannot now enter fully into this subject, but if we did there would be no difficulty in shewing that the present epidemic is due to very different causes from that specified by our correspondent, and that it should be rather ascribed to epidemic influences which will always give rise to a certain number of cases of the small-pox, and more particularly to the improper or inefficient performance of vaccination, to the neglect of re-vaccination, and to the existence of those various insanitary conditions which favour the spread of all kinds of contagious diseases.

Although, however, we think that the clause as it stands at present has not led to the neglect of vaccination, it is very clear that the abolition of accumulative penalties would be virtually equivalent to the abrogation of the Act. Mr. Boddy suggests that such fines should be imposed as many would find it difficult to pay, and if our correspondent will turn to an article which we wrote on the subject in August of last year he will see that we made a similar suggestion. "We might," we then said, "either make the penalties incurred by second and third convictions so heavy that the anti-vaccinators would find it difficult to pay them, or we might take no further proceedings after the first, but with the provision that the parents would be liable to extreme penalty in the event of the unvaccinated child contracting small-pox, and even be indictable for manslaughter in the event of the child dying from the disease." At all events, if the Vaccination Act is to continue a compulsory one no such amendment of it as that now before the House of Commons is worthy of a moment's consideration. If any alteration is to be made, it must be rather in the direction which Mr. Boddy and we ourselves have suggested. We shall, therefore, be anxious to know the result of Mr. Pease's motion, but hope that Mr. Sclater-Booth will do all in his power to resist any attempt that may be made to weaken the efficiency of the Vaccination Act.

Notes on Current Topics.

Complications in Ovariotomy.

During the operation of ovariotomy, unexpected complications oftentimes arise which severely test the skill and patience of the surgeon; a typical instance of which is given in our contemporary, *Le Paris Medical*, of February 15th. Whilst Dr. Michaux Louvain had almost completed a successful operation, it was found there was considerable adhesion of the cyst to the great *cul-de-sac* of the stomach. This was unexpected, as there had only been slight vomiting, and digestion had always been regular. In presence of such a grave complication what course should be taken? Two methods suggested themselves, either to detach the cyst and break down the adhesions as far as possible, or to excise the body of the cyst, leaving a portion adherent in the abdomen.

The first method has been advised and sometimes succeeds.

M. Michaux preferred the second procedure, and recommends it as easier of execution, and safer in its results.

The operator cut away all the part of the cyst on the exterior border of the stomach, and the remaining portion about the size of two palms of the hand, was united to the edges of the wound, by means of metallic sutures. A month afterwards the patient was convalescent. On January 18th, 1877, a distinguished English provincial surgeon performed ovariotomy on a patient advanced in years, and a somewhat similar complication was unexpectedly discovered; the adhesions were not to stomach but to the intestines.

He adopted the plan followed by M. Michaux, of cutting as closely as possible to the intestines, leaving a small portion attached, this plan being better than running the risk of injuring the walls. The result has been a most satisfactory recovery.

Surgeon Dentists and Oculists in France.

It seems that there is an international stampede at the present time, taking place amongst the unqualified; in England our Medical Defence Association is pursuing its laudable work, whilst in France great reforms are on the *tapis*. Dr. Adrien has addressed a petition to the Senate on the profession and teaching of dentistry, and asks for a special law to prevent anyone practising the art, unless he has obtained a degree in medicine or some medical license. His petition has been referred to the Minister of Public Instruction. Dr. Camuset has also addressed a letter to the Union of Medical Legislators, on the subject of oculists, and desires them to prevent the sellers of spectacles employing the word oculists on their prospectus and advertisements, as they thus deceive the public and usurp medical functions.

Ventilation at the Royal Institution.

The well-known maxim of Cicero—"*Sapientissimum esse dicunt eum cui, quod opus sit, ipse veneat in mentum*"—has not suggested itself to the powers who reign over that temple of science called the Royal Institution, otherwise we should not again find it necessary to direct attention to the want of ventilation in the lecture theatre. It is rather hard lines to invite friends to listen to a scientific discourse in an atmosphere well nigh suffocating, and where ladies, before the lecturer has proceeded half-way with his discourse, have to be assisted in a fainting condition out of the dingy back rows of seats under the gallery almost over the heads of those who crowd in long after every available space has been filled, and block up the stairs and passages, making it a life and death struggle to reach the much required fresh air. It is very disappointing to find that the managers of an institution which reckons among its members and subscribers the cream of the scientific world, and which furnishes scientific discourses especially attractive to the fair sex, should not have thought of providing a lecture theatre of sufficient capacity, with means of exit not unnecessarily likely to endanger life in a case of emergency, and in every way affording good breathing space, ventilation without a cold downward current, so necessary to the comfort and health of the fashionable audiences that flock to the Friday evening lectures.

Legal Mutability in its Medical Aspect.

In the person of Dr. Woods, of Monaghan, the glorious uncertainty of the law has been vindicated by a remarkable judgment delivered last week by Mr. Justice Barry. Dr. Woods had—many months ago—proceeded against one Crumley, a public-house proprietor and dispensary committee-man, to recover fees for attendance on the wife of a schoolmaster who was well able to pay, and did afterwards of his own choice pay a doctor, but who, nevertheless, had been given a pauper's relief ticket by Crumley. In this stage of the case Dr. Woods was successful, but Crumley appealed to the higher court over which Mr. Justice Fitzgerald presided. At the hearing in this court the learned judge said that he would have given speedy judgment against Crumley only that the word "fraud" was not contained in the summons, which thus omitted to state the offence committed. To enable Dr. Woods to correct this error he sent back the case, and therefore a new summons was taken out in which the word was inserted. On the rehearing of the matter at the next assize, it happened that Judge Barry, and not Judge Fitzgerald, came circuit to the locality, and the trial came off before him. He delivered an elaborate judgment, in which he said that the merits of the dispute were all with Dr. Woods, but that he must decide against him *because the word "fraud" was used in the summons*. Thus the suitor is sent back to meditate upon the mutability of legal decisions, and to exercise his mind over the question whether it is right that he should be defeated in his suit and mulcted in costs because he—against the advice of his lawyers—acted upon the recommendation of the judge.

Quackery at Liverpool.

With a view of counteracting the evil done upon seamen by quack doctors, the committee of the Sailors' Home, Liverpool, are about to establish a dispensary in connection with it.

The Spontaneous Generation Controversy.

The controversy between M. Pasteur—whom Professor Tyndall describes as "an experimenter who can walk without tripping"—and Dr. Bastian, we learn from the columns of our contemporary, *Nature*, still rages, and is about to be submitted to a Commission named by the French Academy. M. Pasteur challenges Dr. Bastian to make his experiments with urine before the Academy, in which he asserts bacteria appear only when they are introduced by the urine or the solution of potash, and not subjected to a sufficiently high temperature. To this Dr. Bastian replies, "In order that M. Pasteur may not attribute to me the least desire to elude the main point of the debate, and also with the view of testfying the respect which I consider due to the opinions of so distinguished an investigator, I hasten at once to accept his challenge. During the last week I have repeated my experiments several times, and with a degree of precaution going much beyond the severity of the conditions prescribed by M. Pasteur. I repeated them at first with liquor potassæ which had been previously raised to 110°C. for sixty minutes, and afterwards with liquor potassæ which had been raised in the same manner to 110°C. for twenty *hours*. The results have been altogether similar to those produced upon sterile urine by liquor potassæ which had been raised only to 100°, when added in suitable quantity, that is to say, in twenty-four to forty-eight hours the urine was in *full fermentation* and swarmed with *bacteria*. The specimen of urine employed had a specific gravity varying from 1,010 to 1,022, and required about 3 per cent. of liquor potassæ for neutralisation."

It is announced that MM. Dumas, Milne-Edwards, and Boussingault have been appointed to constitute a commission on behalf of M. Pasteur, Dr. Bastian nominating a similar number in this country to represent him and express an opinion on the facts in dispute.

The Goldsmiths' Company have sent a donation of £500 towards the rebuilding fund of the Metropolitan Free Hospital.

Parkes' Hygienic Museum.

THE Council of University College have granted the necessary space for Parke's Museum of Hygiene, to perpetuate the memory of the late Dr. Parkes, which will be the first of its kind in London. The executive committee are ready to recive offers of the gift or loan of objects of hygienic interest, and subscriptions for the adequate endowment of the museum. The subscriptions amount at present to £740, but a considerable sum is yet needed to enable the committee to carry out its laudable purpose.

On the Employment of Salicylic Acid in Catarrh of the Bladder and Typhoid Fever.

M. GUENEAU DE MUSSY is of opinion that this remedy is a useful one, and reports its favourable results in his own practice. One patient suffering from vesical catarrh, with putrid urine, its administration internally diminished the fœtidity of the urine and reduced the malady to the condition of simple cystitis. In some cases of typhoid fever its success was equally manifest. Four patients attacked very seriously, with a temperature of 39° to 40°, eschars on sacrum, in a comatose state, and dry tongue, were placed on salicylic acid, in doses of two grains a day, administered in lemonade or citron. On the following day the amelioration was evident, and recovery soon took place. Was this the result of the medicine, or a simple coincidence? M. Gueneau de Mussy cannot say. The salicylate of soda is not less efficacious. A young man on the eighth day, with a temperature of 40° 6, comatose, delirious, was given it with marked benefit. At the end of three days he was much better and recovered.

A dissussion took place on December 27th, at the Societé de Thérapeutique, in which MM. Moulard-Martin, Constantin-Paul, and Fériol took part, and the conclusions were—That the acid did not possess the remarkable curative properties assigned it in England and Germany. In typhoid fever, M. Moulard-Martin, following the method of M. Guéneau de Mussy, only obtained insignificant benefit. In acute articular rheumatism unless considered as a powerful sedative of pain, it gave no other result. It acted neither on the pulse nor on the temperature, and did not modify in any respect the progress of the malady. But a more serious question was proposed by M. Blandeau, *i.e.*, Whether the acid has not an injurious effect on the organism? According to dentists this agent has injurious effects on the teeth. English observers have noticed its effect on the bones, and necrosis of the tibia has been assigned to its use. It evidently possesses considerable affinity for the calcareous salts of bone, as we see the urine loaded with lime salts in an ultra-physiological proportion from the internal use of the acid. The salicylate of soda presented the same dangers.

If these facts are confirmed, and their verification should be easy, the therapeutical employment of salicylic preparations should be condemned. M. Le Jou (*Jour. de Pharm. et Chimie*) has observed that salicylic acid is eliminated by the kidneys much earlier than is generally admitted. At the end of half an hour its presence may be proved in the urine. Its antiseptic properties are of benefit therapeutically. When taken by the mouth it is transformed into an alkaline salicylate much less energetic as an anstiseptic. To remedy this transformation M. Le Jou proposes to administer it with citric acid thus—

Acide salicylique	2 gr. 50
Sirop citroque	97 „ 50

Twenty grms. of this syrup take up 0 gram. 0 5 of salicylic acid.

At the present time, when many of our English papers are recording such beneficial effects from the use of the acid, these facts must be interesting, and should induce us to suspend our judgment until we have larger data and more satisfactory evidence.

Picric Acid for the Cure of Sore Nipples.

FISSURES of the breast and sore nipples are most troublesome to mothers, and their cure is oftentimes tedious and obstinate. Dr. Charrier, in the last number of the *Courrier Medical*, suggests a new remedy in the form of a solution of picric acid. He employs two dilutions—

A. Distilled water, 100 grammes; picric acid, 1 gram., 30.
B. Distilled water, 100 grammes; picric acid, 1 gramme.

He first washes the breast and nipples with tepid water, and then applies to the fissure solution A, and after a short time washes the part for four minutes with solution B. It does not interfere with suckling, as children continue to take the breast with avidity.

Dry Preparations.

FOR preparing rapidly bones and ligaments for museum purposes, Dr. L. Frederick (*Bulletin de l'Academie Royale de Belgique*) recommends that after the soft parts have been taken away, except the ligaments, the preparation be washed in water, dehydrated by alcohol, and then plunged into essence of turpentine. After two or three days' maceration in this fluid, the skeleton is placed in the position in which it is designed to keep it, and dried in the air. In drying, the bones and ligaments become beautifully white, and the whiteness increases as time passes. The same process gives less satisfactory results for muscles. For a parenchymatous organ, on removing it from the turpentine bath, Dr. Frederick plunges it into melted wax or paraffin during half an hour to two hours, till the bubbles of turpentine have ceased to pass off. When withdrawn and cooled, the piece resembles a wax model, but is far superior in its minor details: the colour of the organ persists.

A Happy Country—Iceland.

DR. JOHN FINSON, a practising physician in Iceland, states that he has never seen a case of syphilis in a native Icelander, only in foreigners.

A New Gravimeter.

IN an interesting paper presented to the Institution of Civil Engineers by J. J. Mann on the subject of testing the strength of Portland cement and other materials of the same class, reference is made to the mode of determining their specific gravity, and a very simple and practical method is suggested by the author of the paper. He employs an ordinary specific gravity

bottle, and a graduated pipette which holds the same quantity of fluid as the bottle, the measure in both being indicated by a cut on the glass; a known quantity of cement, say 100 grains, is introduced into the flask, and the remaining space is filled from the pipette with any liquid which will not dissolve the cement or cause it to set. It only remains to observe the height at which the liquid stands on the scale of the pipette, which is graduated experimentally in order to ascertain the density of the substance experimented upon. This contrivance dispenses with the somewhat tedious process in ordinary use for taking the specific gravity of solids in a powdered condition, and is not unlikely to become of more general utility than anticipated by the gentleman who has introduced it.

Dr. Deville and the Harrogate Commissioners.

A short time since we drew attention to what appeared to us an unjustifiable usurpation of authority by the Harrogate Local Board in the case of their medical officer of health in summarily dismissing him from his post, because he declined to appear before them when summoned to explain his conduct, in having read a paper before the Yorkshire Medical Officers of Health Association which contained matters which were unpalatable to the said Board. We contended then as we do now that Dr. Deville or any other health officer is perfectly justified, nay bound by public trust, to bring such sanitary defects and suggestions forward as may appear to him desirable for the public welfare, and that if he looks upon his salary as "hush money" to make matters pleasant, he is unworthy the trust imposed upon him. Dr. Deville honourably discharged this duty; he brought no personal charge against any; his paper was introduced before a proper tribunal, and was a fair comment with suggestions upon existing sanitary arrangements. Had the Commissioners instead of summarily dismissing Dr. Deville from his post for refusing to apologise, sought to remedy the defects which undoubtedly existed, they would have displayed a little more wisdom, and shown that their zeal for the public welfare was above the suspicion of personality which naturally attached itself to the arbitrary course pursued by them. As the matter now stands, Dr. Deville has brought an action against the Board for salary, and the amount claimed has been allowed, a case meanwhile having been granted on certain points raised for argument in a superior Court.

On Fusil Oil Poisoning.

On this subject there have recently been reported some experiments of Dujardin-Beaumetz and Audigé (*Comptes Rendus*, lxxxiii. 80). The trials were made with dogs, the fatal doses being determined for five different alcohols, and by two methods—administration by the stomach, and by hypodermic injection. For each kilogramme of live weight the quantities necessary to produce death were these:—Of methyl alcohol, 5 grains; of ethyl alcohol, 7·75 grains; of propyl alcohol, 3·13 grains; of butyl alcohol, 1·74 grains; and of amyl alcohol, 1·48 grains. Thus it appears that the most abundant constituent of fusil oil is the most poisonous, and that this amyl alcohol is five times as powerful as ordinary alcohol. And it further seems that the dilution of some of these higher alcohols of fusil oil with ordinary alcohol enhances greatly their toxic effects.

These experiments are instructive to the consumers of Scotch "Silent Spirit," which is blended under the patronage of the Crown, and issued as Dublin whisky for the consumption of the public-house drinkers. This "Silent Spirit" is whisky fresh from the still, and heavily charged with fusil oil—a poison not only ruinous to the health, but maddening to the brain.

A New Tonic.

Another bid to professional favour has been made, in the shape of a tonic called St. Raphael Tannin Wine; an article (although new to this country) which has been extensively prescribed for the last thirty years in the hospitals of Paris, in the varied forms of anæmia chlorosis, indigestion, gouty complications, and, above all, to give a tone to the system in debility and in convalescence. The opinions of the profession have undergone violent changes during the past twenty years since Todd's time, in respect to alcoholic stimulation; the only danger now is, that in our zeal for moderation we may fall into the opposite extreme. Hippocrates insisted that "wine is a substance wonderfully appropriate to man, in health as well as in sickness, *if it be administered at the right time and in proper quantities*, according to the individual constitution." We must confess that we more heartily endorse this principle than that of rigid abstinence, albeit the latter is far preferable to excess. The wine of St. Raphael, however, comes to us more in the nature of a medicament than one which will be taken in large quantities, its chief characteristics being naturally-developed alcohol, tannin (which is the basilic element of Peruvian bark), and grape sugar.

Opinions are somewhat divergent on the value of certain astringents. Those learned physiologists, Profs. Pasteur and Bouchardat—who have, perhaps, given more attention to these matters than any living writers—express themselves strongly in favour of natural tannin wines for therapeutic uses, as "they exercise an action upon the stomach which must be regarded as very favourable, re-animating the energies of the digestive functions."

The wine of St. Raphael—which is the first of the class introduced to this country by the French growers, through their agent, M. Gallais, of Margaret Street, Cavendish Square—is, we understand from several friends, being sent round in small cases to the leading members of the profession, in order to give them the opportunity of practically testing its value. Of course, it is too early yet to confirm or disprove the views of our French *confrères:* we can only remark that St. Raphael is a most agreeable medicament, luscious to the taste, somewhat resembling tent wine, with an after astringent flavour of the tannic element, and a twang of very dry port. We hope to report fully upon its action after a more extended trial.

One hundred and eighteen deaths are reported from small-pox in the United Kingdom during last week; of these 104 occurred in London, 7 in Liverpool, 8 in Manchester and Salford, and one in Oldham. No deaths are reported from any other town.

Admission of Women to Medical Degrees at the London University.

Since the passing, in August last, of the Act to remove restrictions on the granting of qualifications for registration under the Medical Act on the ground of sex, the Senate of the University of London have taken the opinion of the law officers of the Crown as to the nature and extent of the powers conferred on the University by this Act in regard to the admission of women to degrees in medicine, and also on the question whether women, if admitted to degrees, will become entitled to admission to Convocation.

The opinion expressed by the law officers is, in the main, to the effect that the Senate have power to examine *all persons* for medical degrees, and after examination to confer degrees upon them in such mode, and in compliance with such conditions, as the Senate shall from time to time determine; that the Senate may frame any regulations they think fit as to the examinations which women candidates for degrees are to undergo, not necessarily the same as those prescribed for men; and that women admitted to degrees in medicine or surgery would become *ipso facto* members of Convocation.

There is a special clause in the Act which removes all title on the part of women to take any part in the Government management or proceedings of the universities or corporations in virtue of their degree—a diploma registered; but the members of Convocation virtually have no part in the management of the University, all power being in the hands of the Senate. So the clause does not interfere with women becoming members of Convocation.

After the expression of opinion by the law officers of the Crown, the Chancellor (Lord Granville) drew the attention of the Senate to the powers conferred on them by this new Act, and after a lively debate, it was decided by a majority of two to one (which majority included Sir James Paget, Sir William Gull, and Dr. Billing) "That the University should exercise the powers conferred by the Act."

A committee has already met, to consider the mode and conditions of giving effect to the resolution.

This decisive step on the part of the leading medical examining board practically settles the whole question, and the long controversy on the admission of women to the medical profession may be considered at an end.

Prof. Lister and London Clinical Teaching.

The hospital surgeons and surgical lecturers of Ireland and Scotland have been so loudly bidden and so long expected to bow the knee before the great pre-eminence of London practitioners, and teachers who have been accustomed to breathe the air of "head-quarters" and to plume themselves upon their unchallenged supremacy, that they will, no doubt, stand helplessly aghast at the audacity of a surgeon who hails from outside the sound of Bow bells, and yet has the courage to administer a most complete and scalding snub to the great ones of the surgical Babel of the south. It is positively startling to the reader and a real treat to the provincialists of Dublin and Edinburgh to know that there is still a good judge of surgery who does not take the London teachers at their own estimate, but with amazing daring tells them that they are nothing better than a herd of botches and ignoramuses.

This—in plain terms—has Prof. Lister, of Edinburgh, done, and done it, moreover, in response to a flattering suggestion that he should be invited to breathe the atmosphere of superiority and to pick up the crumbs of the great ones of London. On the 22nd of last month, it having been mooted that Prof. Lister should occupy the seat of Sir Wm. Fergusson in King's College, the Edinburgh students addressed to that gentleman a request that he would not be claimed away from them. In reply to them, the learned professor gave them a full answer, which he wound up in the following notable words:—

"If I turn to London and ask how instruction in clinical surgery is conducted there, I find that, not only according to my own experience as a London student—which I once was—but also from the universal testimony of foreigners who visit there and then come here, it is, when compared with our system here, a mere sham. Clinical medical teaching is in various London schools exceedingly well and ably conducted; but the magnificent opportunities of demonstrative teaching presented by clinical surgery are to a great extent neglected. And, therefore, even if the too flattering article in a certain medical journal holding out to me the prospect of fame and fortune and so forth were more reliable, nay, even were it certain—and I need not say how far indeed from what would be the fact the supposition is—that I should attain the very topmost position in private practice, and at the same time have to teach clinical surgery as it is now taught in any London school, I would certainly not go to London."

It would certainly seem as if a personal application of the carbolic acid treatment had conclusively stamped out the last germ of modesty and produced a commensurate and contemporaneous hypertrophy of the cranial *locus* of self-esteem. The learned professor would appear to have actually taken away the breath of our London contemporaries with astonishment, for, with the exception of one of them—which surrounds him with its editorial *ægis*—not a syllable appears in their columns, although a fortnight has elapsed to afford rest from the shock. We await at present the volcanic outburst of the insulted dignity of the great metropolis, and, at the same moment, we can imagine the cordiality of greeting of the northern salon when he takes up the rostrum at King's College. It may be that Mr. Lister's speech is a free translation of the dogma—*nolo episcopari*. Perhaps he will not be offended if we offer a still freer version—

"I cannot marry you,"
My pretty maid.
"Nobody axed you, Sir," she said.

The Sanitary State of the War-office.

It is almost impossible to believe that such a large and important establishment as that of the War Office should have been allowed to remain so long as it has in the unhealthy condition described in the report just issued. Considering the great wealth of this country, the ample resources at the disposal of Government, and the great waste there is of the public funds in matters of much less importance, it is surprising that something has not been done before to rectify the evils complained of, or that the present building has not been pulled down and a new one erected in its place. The commissioners have stated that the office has already been "so cut about and altered, that they cannot recom-

mend any one system of ventilation applicable to the whole office, and that if the alterations they recommend be thoroughly carried out, they will only mitigate the evils, not remove them." It is clearly, then, the duty of the State to provide such a building as is not only consistent with the dignity of so important an establishment, but one which is built and furnished in accordance with the most approved requirements of modern sanitary science.

Although there has been no specific outbreak of disease in consequence of the unhealthy state of the War Office, it is probable that it would not be long before some such outbreak occurred were this building to continue long in its present condition; and only the fact of the 633 *employés* not living in the building, but only engaged there for eight out of the twenty-four hours can account for their comparative immunity from disease. But it is to be borne in mind that it is not by the occurrence or absence of typhoid or other fevers that the sanitary condition of such a building as the War Office can be rightly gauged. As the commissioners observed, daily exposure for several hours to insanitary influences must tend to deteriorate the health of persons so exposed. We have no doubt that hundreds die every year from pulmonaay and other affections, the seeds of which have been sown by confinement in the close and ill-ventilated rooms of this and similar institutions.

Indeed, were this the only great public building which has been examined and found wanting, that a large class of people who have to work in them would not have much cause to complain. But the great increase in business and all kinds of commercial enterprise, the great rise in the value of property in the more central districts of the metropolis, and the difficulty of finding accommodation for all the clerks engaged in the city and elsewhere, are strong peasons for keeping a strict vigilance over all kinds of public and even private institutions in which a number of people are employed.

British Practitioners in France.

Le Progrès Medical has a very pronounced leader in its issue of February 17th in favour of the scheme of M. Roger Marvaise, and as in justice we are bound to consider French feeling and to listen to both sides, we furnish our readers with a *resumé* of it.

The editor indignantly repudiates the idea that the proposed law has been inspired by unworthy professional jealousy, and wonders at the English press being alarmed at a shadow of its own creation.

The views of English lay and medical journals are erroneous, and they have failed to grasp the spirit of M. Roger Marvaise's proposition.

He claims for his own countrymen the right to adopt legislation similar to that in force in England, and cannot see that we have any reason to complain of a scheme which has in view the protection of the public health and the suppression of charlatanism.

A qualified aspirant for French practice or honours will not have to commence his medical education *de novo*, or to waste years in study at a French medical school, *but he will have to pass an examination which will not take much longer than a week, after having satisfied the medical authorities that he has undergone a course of study equal to what is expected of French candidates.*

He observes that the same rule is in force in England, and foreigners are expected to obtain a degree or licence in medicine or surgery before they are recognised or registered as English practitioners. Can Englishmen then reasonably complain of the application of this principle in France? Our sole aim is to put resident foreign practitioners in France on the same footing as their French *confrères* withhut giving either any privileges. Such absurdities as have found their way into the columns of English journals are unworthy almost of notice. As, for instance, "that Jenner or Paget could not see a patient in France without submitting to full examinations and satisfying us of their preliminary education."

We quote some of the concluding portions of the article in full :—"Our English *confrères* are of opinion that M. Waddington is disposed to submit the question to an international commission, and we see no reason to prevent any negotiations likely to establish an absolute reciprocal equivalence between French diplomas and English degrees, but *on condition that these negotiations will not delay for a day the vote on the scheme of M. Roger Marvaise.*

"The colleges conferring the legal right to practise in Great Britain are numerous, but all do not enjoy the same reputation; if some of them are on a level with French colleges, there are others below our standard."

"To make a choice would require long deliberation, and we have not now time to solve the question. We must first put foreigners on the same footing as our countrymen, and then we can easily enter into negotiations."

THE deaths last week from fevers (other than small-pox), were less than half the average number of the past ten years.

THE Metropolitan Asylum Small-pox Hospitals contained 916 patients on Saturday last, including 112t convalescent cases at Limehouse, against 834, 811, and 901 at the end of the three preceding weeks. The new cases admitted during the week were 205, against 194 and 238 in the two previous weeks.

IN reply to statements recently made in the House of Commons in reference to the Deptford and Fulham small-pox hospitals, alleging that there has been unnecessary delay in carrying out the building of new hospitals, the committee of these two institutions have drawn up a report showing the date of each step taken by the managers in relation to these buildings, as "the best answer to such an unfounded complaint."

Correspondence.

UNQUALIFIED ASSISTANTS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In my last letter I merely made some general observations and strictures on the unbecoming assumption by many "unqualified assistants" of being veritable medical men, either on account of gratifying personal vanity, or for the sake of obliging their very honourable employers, who, to their shame be it spoken rather, encourage the ephemeral counterfeit than otherwise, and I hope I clearly showed all right-minded "unqualified assistants" the foolishness of such an assumption.

I now come to consider the much more disgraceful and reprehensible practice of the medical practitioners themselves, who, for the sake of private interests, and an inordinate desire for gain, employ "unqualified assistants" to carry on branch practices, superintend the management of dispensaries, attend club and parish patients, or take in hand those unpleasant engagements called nocturnal confinements.

Now, in order to prevent any scandal arising and obviate the chances of publicity of any mismanagement on the part of these "unqualified assistants," they are duly provided by their principals with any number of already signed death certificates, &c., so that the friends of those patients who succumb to a *curable* or *incurable* disease are provided *at once* with death certificates; by this unworthy manœuvre their unresisting tools, I mean their unqualified assistants, are completely shielded by their unprincipled principals, who doubtless are much elated at the way by which they elude the ends of justice.

This most wretched practice is carried on, I really am most grieved to confess, by all grades of the profession alike, quite irrespective of degrees or diplomas; it is patronised by Fellows, Members, and M.D.'s of Oxford and Cambridge, down to those which are obtainable by purchase; so that one class cannot throw stones with impunity at the others; for they all, more or less, engage in this dirty work; and little care they as long as they feel the ill gotten money in their pockets—their callousness is such, that they are perfectly indifferant as regards the opinions of others; good or bad it is all the same to them; the getting ahead, or the outwitting of brother practitioners by the establishment of a two-penny-half-penny dispensary placed near their opponents' residences for the sake of depriving them of as many patients as possible is to them something delightful, and they gloat over such a *noble* deed like ghoules gloating over a decomposed corpse, to take a similitude from the "Arabian Nights;" happy would it be if these disgraceful pettifogging practitioners could be kicked out of the profession: but no that cannot be, they are perfectly safe, and they can disgrace the profession with impunity, for the love of money and the getting of it has so persuaded the licensing boards that they care nothing about anything else; they get the money, they grant their diplomas, and the recipients may go and hang, the horror of the profession is *nothing* to them, however they may spout at their gatherings in Lincoln's Inn or Pall Mall about the dignity of Surgery and Medicine, the rapid advances and the wonderful discoveries made yearly by prominent members of the profession; but such ebullitions are all froth and splutter, for a great number of these prominent members are guilty of the infamous practices upon which we are now animadverting.

"An English Practitioner" has had the boldness which one must admire (though I sincerely wish he had not hid his name under the *nom de plume* of "An English Practitioner") of bringing publicly forward a disgraceful state of affairs, and which shows into what a degraded condition the medical profession is now brought by a set of men, who hold degrees and diplomas, from the highest to the lowest, who for the sake of expeditiously filling their ever-gaping pockets, resort to practices which have dragged Medicine and Surgery through the mire, reducing them to a trade, instead of heightening them to the highest standard amongst their sister sciences.

The time has now come to thrust this cankerworm from our midst, and all right-minded members of this most noble self-denying profession, to which I for one am proud of belonging notwithstanding its numerous drawbacks and annoyances, should put our shoulders to the wheel and strive heart and soul to wrench out an abominable evil which has flourished *so* long and *so* silently.

The "Medical Defence Association" is perfectly powerless to root out this mischief for these interloping "unqualified assistants" are perfectly secure from legal prosecutions, and why? Because they are shielded by medical practitioners; for it is these wretched grasping "medical men" who cause this evil to continue, and it is *these* who cannot be too severely contemned, because *they* encourage the evil, and it is *they* who wilfully deceive their patients by encouraging the belief that their unqualified assistants are qualified. Many of the unqualified assistants are more to be pitied than otherwise, because in order to obtain a livelihood they must do what their employers wish.

The "Medical Defence Association" to which one cannot accord to much praise, *can*, I am glad to observe, prosecute quacks and others of that base class, but it cannot prosecute these interloping "unqualified assistants" or their qualified protectors, because they are not out of the pale of medicine; for they, and their counterfeit doctors, are protected by that very profession they strive so much, undesignedly, it is to be hoped, to undermine.

The *only* argument, which one must confess is very weighty, and which the advocates for the employment of "unqualified assistants" can advance with any show of reason, is, a qualified assistant *may*, after becoming acquainted with all the ins and outs of a certain practice, if he chooses, set up on his own account and practise against his former employer, much to his detriment; therefore it is to secure themselves against such an untoward contingency that some medical men object to the employment of qualified assistants.

I know a case of this kind existing in Greenwich at the present time, where a qualified assistant seized hold of some small matter as a pretext for squabbling with his principal, accordingly left him, set up on his own account, abstracted a great number of patients, and very nearly succeeded in ruining his former employer. Unfortunately, there are too many cases similar to this, but still it offers no extenuation for the employment of "unqualified assistants" very carefully and considerately provided with a goodly collection of already signed death certificates to carry on branch practices, &c. It does not justify cheating, it does not palliate mean deception; in fact, however leniently we may speak of "unqualified assistants" and their many short comings, still, we cannot inveigh *too* strongly against this wicked infamous mode of practicing, of which a far too considerable a number of medical practitioners are guilty.

I have now brought my second letter to a close, and in my next and *last* I will lay some suggestions before my readers which I hope will receive their approbation; and I also trust that they will have the support of an "English Practitioner" whom I cannot thank *too* much for the unveiling of this long hidden scandal.

I am, Sir, yours obediently,

Camberwell. E. M. B.

PRESIDENT-ROLL OF THE ROYAL COLLEGE OF SURGEONS IN IRELAND.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—At the late meeting the following table was to have been my speech, but it was unspoken, because the chartered yearly succession never seemed in danger.

	Presidents.	*Scientific and Clin. Chairs.*
1785	Samuel Croker King ...	Steevens'.

1874 Jolliffe Tufnell	Mil. Surg., R.C.S., City Dub.
1875 Edward Hamilton ...	Anatomy, Steeven's
1876 George Hugh Kidd ...	Anatomy, Dublin, Coombe

It will be seen that during the ninety-two years, since our foundation, there were twenty-four re-elections, always after intervals of which the shortest was three years (M'Evoy), the longest twenty-eight (A. Colles). Richards and Crampton presided on four occasions; such eminent Presidents as King, W. Dease, Todd, W. H. Porter, O'Beirne, and Hutton held office once only; and such remarkable former Fellows as Daunt, O'Ferrall, Houston, Pentland, E. McDowel, John Jacob, Bellingham, Power, and Wilde (*a*) were never elected.

As the list may be recorded in the College, I will feel obliged for any corrections or additions. I am, &c.,

6 Merrion Square, North, March 1. E. D. MAPOTHER.

(*a*) As I wrote this name, it occurred to me that it is now time to commemorate our great medical statist and authority on the eye and ear. His labours in Irish antiquities and topography were so highly valued, that the movement would be aided by all classes of his countrymen.

THE DISFRANCHISEMENT OF THE "LEDWICH" SCHOOL BY THE UNIVERSITY OF DUBLIN.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Ledwich School of Medicine, Peter Street, Dublin.

SIR,—Relying on your usual sense of justice and impartiality, might I beg of you to insert in your valuable journal the following statement of facts, as they have occurred between this Institution and the Board of Trinity College. It is a plain, unvarnished tale, without the slightest attempt to suppress or exaggerate a single fact of any consequence.

I am, yours always very truly,

EDWD. LEDWICH, F.R.C.S.I.

Report to the Board of the Ledwich School of Anatomy, Peter Street.

February 17th, 1877.

Gentlemen,—I beg leave to call your attention to an occurrence which has taken place in connection with this Institution—one that I believe is deserving of the most earnest consideration on your part, from its very great importance in every sense of the word. On the 16th of January, 1877, Mr. Alfred Mason, a pupil of Mercer's Hospital, called on me with a request that I would sign for him a card, certifying his attendance on the hospital for the current session. Having had from personal observation the most ample opportunities of observing that he was strictly entitled to what he asked, I at once acceded to his request, and accordingly filled the card in exact conformity with what I conceived was required, and dated it up to the day only for which I certified his attendance, but not for a single hour beyond that period. It was in fact framed in the usual manner in which I was in the habit of signing for all other licensing bodies. I likewise impressed on him to state to the Senior Lecturer of Trinity College that such only was my intention, and no other. I heard nothing more of the matter until the 31st of January, 1877, when I received the following letter from the Rev. T. Slack:—

Trinity College, Dublin, Tuesday, Jan. 30th, 1877.

Edwd. Ledwich, Esq.

Sir,—I am directed by the Board of Trinity College to inform you that a certificate, a copy of which is subjoined, has been presented by the student named therein to the Senior Lecturer, and by the Senior Lecturer laid before the Board.

"Trinity College, Dublin. To the Senior Lecturer.

"Mr. Alfred Mason has diligently attended the Practice and Clinical Lectures of Mercer's Hospital, from the 1st of November 1876, to April 1877.

(Signed) EDWD. LEDWICH.

"Date, January 16th, 1877."

This certificate purports to declare, under the guarantee of your signature, bearing date January 16th, 1877, that the student named has diligently attended a course of medical instruction, terminating in April 1877.

The Board having hitherto included the Peter Street School of Medicine, of which you are the head, in the list of the medical schools recognised by the University of Dublin, considers itself bound to take official cognizance of the above matter. With that view they have directed me to bring it under your notice, in case you may have any remarks to address to the Board on this matter.

The meeting of the Board at which this matter will come under consideration will be held on Saturday next, the 3rd of February, at twelve o'clock.

I remain, Sir,

Your obedient servant,

T. SLACK, Registrar.

On the receipt of this communication I wrote at once in reply, repudiating altogether the idea that I was at the head of the School in Peter Street; at the same time explaining to him that the Institution was governed by a Board of Lecturers, eight in number, and to this Board I acted simply as Registrar. I likewise stated to him that I had signed the certificate in question only in my capacity as surgeon to Mercer's Hospital, and in doing so, had no desire whatever to impose a false certificate on the Board of Trinity College, or to show the slightest disrespect to the regulations of that body. I sought to show him that the card itself clearly proved that I held myself only responsible up to the day of its date, but from that hour all responsibility on my part ceased. I concluded by stating that any further explanation that might be considered necessary I would, if in my power,

be happy to afford. On the 3rd of February, 1877, I received the following letter from the Rev. T. Slack:—

Trinity College, Dublin, 3rd February, 1877.

Sir,—I beg to acknowledge the receipt of your letters of the 1st and 2nd of February. I read them to the Board at their meeting, and I am directed to inform you that the Board regret to say that they do not consider your explanation satisfactory.

I am, Sir, your obedient servant,

T. Slack, Registrar.

Edwd. Ledwich, Esq., F.R.C.S.I.

To this letter I sent no immediate answer, as I thought it much the more prudent plan to defer any definite reply, until I received something more explicit from the Board of Trinity College, and in coming to this conclusion, it will be seen that I was perfectly correct, for on the 8th of February, 1877, I again heard from the Rev. T. Slack in the following terms:—

Trinity College, Dublin, 8th February, 1877.

Sir,—I am directed by the Board of Trinity College to inform you that at their meeting on February the 3rd, 1877, after hearing your letters of the 1st and 2nd of February inst. read, passed the following resolution:—"That after the current session, the Peter Street School of Medicine be removed from the list of medical schools recognised by Trinity College." I am also to inform you that I am directed, according to the usual course in such matters, to communicate the above resolution to the Registrar of the Academic Council before their next meeting, which will take place on Wednesday, the 28th of February, on which day the Council will have before them the above resolution of the Board.

I am, Sir, your obedient servant,

T. Slack, Registrar.

Edwd. Ledwich, Esq., F.R.C.S.I.

Directly on the receipt of this letter, which left me perfectly free to act altogether irrespective of any ties by which I might consider myself bound to Trinity College, I wrote at once to the Rev. T. Slack, simply remarking that I looked upon the course that had been taken by Trinity College as rather harsh towards a body of gentlemen of which I formed only an unit. I stated also that it had accidentally come to my knowledge that a similar card, but perhaps more formally signed by one of my colleagues in Mercer's Hospital, had been accepted by the Board of Trinity College—thus clearly exonerating me from any intention whatever of committing any fraudulent act, and concluded by stating that any informality, however unintentional, I might have been guilty of, I very deeply regretted, and as sincerely apologised for. I also added that I made the reparation with no desire whatever of influencing any decision which the Board might have thought proper to arrive at, but simply as one strictly due to its members as well as to myself. To this communication I received the following reply:—

Trinity College, 12th of February, 1877.

Sir,—I have laid before the Board your letter of the 8th of February, 1877, according to your desire expressed therein.

I remain, your obedient servant,

T. Slack, Registrar.

Edw. Ledwich, Esq., F.R.C.S.I.

I have thus endeavoured to give a plain and simple statement of facts as they really did occur, without any attempt at exaggeration, or suppression of a single incident, and with you it now remains to take any steps that you may think proper in the matter. The only explanation that I can offer to account for the extraordinary step taken by the Board of Trinity College is, that its members are labouring under the misconception that the School and Mercer's Hospital are one and the same. That such an idea is wholly without a particle of foundation you are all perfectly aware, and that therefore any act on my part done in my capacity as surgeon to the hospital, should not with any degree of justice be visited on the School.

Edw. Ledwich.

The report having been read, the Board, after some discussion, came to the resolution of confiding the matter to Dr. Barton, who kindly undertook to prepare such a letter as might be laid before the Academic Council of Trinity College, and ultimately adjourned until Friday the 23rd inst., when the letter in question should be brought before them for their approval.

Since writing the above the decision of the Academic Council confirming the act of the Board of Trinity College is now well known, and by this it would appear that the arbitrary power is assumed of disfranchising a number of gentlemen for the act of one who issued a card in his capacity as an officer of an entirely different institution. That the Board of Trinity College has in this particular, simply through misconception, I have already stated, but that the same plea cannot be advanced in extenuation of the line of conduct pursued by the Academic Board, as it has amongst its members three Fellows of the Royal College of Surgeons, all fully conversant with matters of this description, and it was their bounden duty to have explained to their colleagues that they had determined to adopt. Apologising for the great length to which this communication has extended,

I am, my dear Sir,

Yours always, very truly,

Edward Ledwich, F.R.C.S.I.

EXEMPTIONS FOR LADY DOCTORS.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

Sir,—In my letter of the 24th ult. I gave you official information of what you professed yourself ignorant when you wrote your comments on the admission of Miss Walker-Dunbar to the examination for the licence of this College in the Medical Press of the 14th and 21st February—namely, that several other foreign universities besides Zurich *had been* admitted by the College to the same privileges which were extended in January last to Zurich.

In your last issue (28th February) you shift your ground and state that "you have reason to believe that the number of male persons who have received the license of the College in foreign degrees is infinitesimal, and the date of their admission long past, and that the recognition of the Zurich degree was therefore an extraordinary privilege conferred for the express purpose of admitting female candidates who could not give the usual guarantees of education. Dr. Finny has not given us the numbers or times for which we asked, and has, therefore, not contravened the inference which we drew."

When as registrar of the College I have made official statements such as those in my letters of 15th and 24th ult., it seems to me that you exceed good taste, if not your privilege as a journalist, to require chapter and verse out of the minutes of the College before you give credence to the information I gave you.

I shall, however, overlook such poor stratagems to cover defeat, and shall close this correspondence called forth by the inaccuracy of your statements, by correcting the remark "that the date of admission of holders of foreign degrees to the licence of the College is long past," when I state officially that in 1872, 1873, and 1874 the same privilege was extended to male candidates, which in January, 1877, was extended to a female candidate by reason of their holding foreign degrees.

I have the honour to be, Sir, your obedient servant,

J. Magee Finny, M.D. Dub.,
Fellow and Registrar.

King and Queen's College of Physicians
in Ireland, Dublin, 3rd March, 1877.

[We have elicited from the Registrar of the College of Physicians the fact that the number of foreign graduates who have accepted the bid is so few, none having offered for three years past, as to form no rule such as might justify the extension of the same latitude to the Zurich degree.

We leave it to the profession to judge whether or not our indictment against the College that it "accepts from women curricula which they would not receive from a male student, is justified by the facts." If it be, we think the profession and Medical Council are called upon to stop so unfair a traffic. We desire to give lady doctors every fair play, but we protest against their being privileged to enter the ranks of the medical profession upon evidence of competency which would not entitle a home student even to offer himself for admission.—Ed. M. P. & C.]

MEDICAL ADVERTISING.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—In my opinion Mr. "P. V. Timothy, L.R.C.P., Lond." deserves the thanks of the great mass of the profession, the general practitioners, not for "philosophically and without prejudice" constituting himself a "true philanthropist" by prescribing for his patients at fourpence a head, but for calling attention to the great and growing scandal of medical advertising in the daily papers, which he stigmatises as "the schemes of the leaders of the profession" and asserts to be "necessary for success." Suppose I were to cause a few advertisements, announcing my name, residence, and qualifications to be inserted in the *Times*, *Standard*, and other papers, what an uproar there would be! How my neighbours would cry out! I should be called upon to resign by the various societies of which I am a fellow, and, in a word, I should be "cut" by every right-minded member of the profession, and very properly too. But "Dr. ——, F.R.S., M.R.C.P.," or Mr. ——, M.A., M.C. Cantab., F.R.C.S.," &c., &c., may, and do advertise daily, and the learned bodies aforesaid look on complacently and make no sign. Why should this be? Just this: these "leaders" (?) of the medical world, advertise indirectly—books, compiled for the most part, and "special" hospitals (!) are the excuse: and that these shifts are, as Mr. Timothy asserts, "necessary for success," is patent enough when we see the staff of these benefited institutions doing "a roaring trade," while their *confreres*, more modest and often much abler, men, who nevertheless scorn to have resourse to such pitiful dodges, have difficulty in making both ends meet.

Either let advertising, directly or indirectly, be rigidly suppressed, or as the Cornish parson said to his congregation, "Let us all start fair, my dear brethren!" Surely, what is sauce for the gander, should be sauce for the goose! and geese we shall be, if we, the body of the medical profession, do not take some decided action in the matter before long, and, for many of us, it is too late. I enclose my card and am, sir,

Yours faithfully,

A GENERAL PRACTITIONER.

LEPRA GRÆCORUM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—It might interest the profession (especially that portion engaged in teaching) to know that there is a specimen of a disease, very rarely seen in this country, now in the wards of the Kilkenny County Infirmary.

The patient is brother to a man who died a few years ago of "lepra græcorum," and who, previous to his death, excited much interest in your professional circle in Dublin.

The present sufferer persisted, contrary to repeated warnings, in sleeping with his brother and wearing his clothes.

I shall be happy to show this case to any member of the profession who may feel a desire to see one of the "ills that flesh is heir to" rarely to be seen in this country, and only when imported from abroad; and if any of our teachers should wish to exhibit him to the classes I shall in every way facilitate his transfer to Dublin. He is rapidly declining and not likely to live very long, although the disease has not yet attained the very remarkable development which it exhibited in his brother's case before his death, and of which an excellent drawing has been preserved.

The case is one of peculiar interest, and I shall be happy to supply further particulars to any inquirer.

Yours, dear Sir, very truly,

ZACH. JOHNSON, A.M., T.C.D., F.R.C.S., &c.,
Surgeon Kilkenny County Infirmary.

THE BIENNIAL PRESIDENCY IN THE IRISH COLLEGE OF SURGEONS.

OUR columns have been a good deal occupied recently in the discussion of a proposal that the Presidency of the Irish College of Surgeons should be a Biennial, instead of an Annual office, as heretofore, and our readers will recollect, we argued against such a proposition on the ground, *firstly*, of its inconsistency with the Charter; *secondly*, of its inexpediency in the interests of the College; and, *thirdly*, because its adoption would be equivalent to final ostracism of the Provincial Fellows from the honours of the College. The feeling of the Fellows was so strongly and almost universally expressed against the project, that we doubted that its advocates would go to trial before the College, and we even felt uncertain that the twelve requisitionists would be found to sign the necessary memorial to the President for a special meeting of the Fellows. That difficulty was, however, overcome, and sixteen names secured, and, in accordance with the requisition, the College met on Wednesday last, at twelve o'clock, to discuss the proposal. There was—considering that it was a special meeting—a large assemblage of the Fellows, amongst whom were a good many of the provincial members, to whom the proposal seems to have been received with something like indignation. The President (Dr. Kidd) occupied the chair, but the Vice-President (Dr. Robert MacDonnell) was absent through ill-health. The Biennialists were represented in chief by Dr. Barton, Mr. Corley, and Dr. Tyrrell, and on being called on to move the resolution, which was to pledge the College to their views, a change of policy was unfolded by them, which somewhat astonished the assembly. The original abstract proposition, "That it is expedient that the offices of President or Vice-President should be in future held for a longer period than one year" was withdrawn (doubtless out of respect for the provisions of the Charter to the contrary), and an amended resolution proposed to the effect "that the outgoing President and Vice-President should be requested to present themselves for re-election at the expiration of their terms of office." This change was at once objected to by Dr. Mapother, on the ground that the resolution, as amended, was not consistent with the purpose for which the College was called together, inasmuch as it was personal to the present officers and not a general principle.

After some discussion, Dr. Barton altered his resolution into the plural number, in order to obviate Dr. Mapother's objection. An animated debate ensued, in which Mr. MacNamara, Dr. Darby (of Bray), Dr. Corley, Dr. Jacob (of Maryboro'), Dr. Tyrrell, Dr. Wharton, Dr. Smith (of Donoughmore), Dr. Smyly, Dr. Benson, and Dr. Jacob (of Dublin) spoke.

From first to last it was obvious that the proposal before the chair had few friends, and that the feeling of the College was dead against it, and eventually it was (at the suggestion of Dr. O'Leary, M.P.) withdrawn.

The withdrawal—though, perhaps, the most amicable settlement of the question—is not, we think, the best end of the matter in the interest of the College. A proposition of this sort, if it had received the least encouragement, might be resuscitated at any time for the benefit of an individual; and it would be well if the College had, once and for all, declared its disapproval of biennial presidencies. On Wednesday last it was quite prepared to record such a vote, and if a division had been taken we hardly think that fifteen votes would have been polled in favour of the resolution. Irrespective of any consideration personal to the present or coming Presidents and Vice-Presidents, there was really nothing to say for it, and the advocates put forward to support the proposal must have been conscious that they were fighting a hopeless contest. The result is, as it should be, and if we ever hear of perennial presidencies again let us hope that the question will be dealt with as an abstract principle and not as election *ruse*.

The roll of Presidents which Dr. Mapother contributes to our columns to-day is sufficient to show that, for very nearly a century the College has been content with annual presidencies, and has found them work satisfactorily, and we hope that personal ambition will not be allowed to disturb so time-honoured a system.

Medical News.

The Cancer Hospital, Brompton. — The annual general meeting of the governors of this hospital was held on Friday last, Mr. David Mocatta in the chair. The twenty-sixth annual report of the committee was read by the secretary, Mr. H. J. Jupp, which showed that the financial position of the charity was satisfactory, although there has been a slight falling off in the items of donations and new annual subscriptions, but more than balanced by an excess of legacies. During the year 863 new patients had been received. Thanks were recorded to the Baroness Burdett Coutts, to Lady Abercromby, the Lady Visitors, and to the various officers of the institution. A vote of thanks to the chairman terminated the proceedings.

Modes of Treating Town Sewage.—A public meeting of the Sanitary Institute of Great Britain will be held at the rooms of the Society of Arts, John Street, Adelphi, on Wednesday next, March 14, at three p.m., to consider the report recently issued by the committee appointed by the President of the Local Government Board upon the disposal of town sewage. The chair will be taken by the President of the Institute, his Grace the Duke of Northumberland, and the discussion will be opened by Sir J. W. Bazalgette, C.B., Engineer to the Metropolitan Board of Works, Vice-President of the Institute. Medical officers of health and sanitarians generally are invited to be present. At the close of the discussion an adjourned public meeting will be held to receive the report of the committee of the Sanitary Institute of Great Britain, and to order thereon.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

H. E. J.—Wanted the address of the advertiser of "A Practice for disposal in Yorkshire" who advertised with the above initials attached in our number of Feb. 21. There are letters awaiting him at our office.

The Croonian Lectures will be delivered at the Royal College of Physicians on March 7, 9, and 14 by Dr. Braxton Hicks. Subject: "The Difference between the Sexes in Relation to the Aspect and Treatment of Diseases." Members of the profession are admitted on presentation of card.

The Working-classes and Hospital Saturday.—We are happy to observe our excellent contemporary, *The Leisure Hour*, take the same view of this question as ourselves. In its number for March it concludes an able summary thus: "It is gratifying to note an increase in the contributions; but even if the total had been made up entirely—by no means the case—of sums given by working men and women residing within the bills of mortality, it would not come to a penny a head. Working Jack and Jill ought certainly to contribute at a more liberal rate than this to institutions which shelter them in sickness and set them on their feet again by means of medical and surgical skill and appliances beyond the reach of some of those who regularly subscribe to hospitals. Instead of flattering the London working-man, it is truer kindness to tell him that his conduct in responding on so parsimonious a scale to the appeal of those who sacrifice time—and realised time, hard cash—and spare themselves no trouble in their efforts to induce him to, fractionally, help himself, does not, in American phase 'look pretty.'"

Mr. Geo. Andrew is thanked.

To the Editor of the Medical Press and Circular.

Sir,—Have I any redress in the following case; J. J. N. Licentiate, a country practitioner in the same village with myself, got a sharp attack of diphtheria; for about ten days he was confined to bed, during which time he called me down three or four times a day to see him and make applications to his throat.

During the whole time of his illness I did all his duties, both in hospital and private practice, dressing some wounds every day, prescribing and mixing medicines, generally my own. He did not care how much trouble he gave me as I fully expected all along I was to get paid by him for my services in the same way as on three former occasions I had done when I required his services in my absence. I left the place shortly afterwards but never did he say a word about recompense. Since then I wrote to him twice but received no answer. This man prides himself in his full estimation of medical etiquette. May I have your opinion on the subject. In my letter I valued my services for the fortnight at £10.

I am, Sir, yours truly,

Ex-Dispensary Doctor.

[Our correspondent would have his remedy at law if the judge took the view that payment for the services rendered might reasonably have been anticipated of the person receiving them. As between two medical men practising in the same locality he might take the opp ' ce view, in which case our correspondent could not recover. If a con ing person puts trust in a mean or unprincipled person he is—in any walk of life—liable to such treatment, and we advise our correspondent to be content with having purchased his experience and to be more wary in future.—Ed. M. P. & C.]

FOURPENNY DOCTORING.

In our issue of Jan. 10th we drew attention to another handbill which was being distributed with the name of P. V. Timothy, L.R.C.P. Lond., M.R.C.S. Eng., &c., attached, offering advice and medicine in the morning at fourpence, in the evening at sixpence per head. In the following number the gentleman named disclaimed all knowledge of the handbill, and stated that his name had been used by Dr. George Fearon entirely without authority or consent, and that he should demand its instant withdrawal. We congratulate Mr. Timothy upon having acted up to his expressed intention, of which the following will explain:—

To the Editor of the Medical Press and Circular.

Sir,—In accordance with the suggestion mentioned in my letter concerning the unwarranted use of my name by George Fearon, M.D., 42 Craven Hill Gardens, Hyde Park, for the better vending of 4d. bottles of physic, I placed the matter in the hands of an attorney, but upon the assurance that Dr. Fearon would not again adopt my name as an alias, I have suspended proceedings.

Yours faithfully,

Barrow-in-Furness, March 1st. P. V. Timothy, L.R.C.P.Lond.

Erratum.—In the letter on "The Vaccination Act" in our last number, lines 51 52, page 175, should read thus: "and it completely stands in the way of the main object (which we *all*, except those who are opposed to conviction, desire to attain)—viz., universal vaccination."

A SONNET.

(*Written while attending a tedious labour.*)

Hail, Patience, Queen of all the Virtues! thou
Upon me in mine hour of trial smile,
O goddess of the calm unruffled brow;
For staid Lucerna mocketh me the while,
Nor comes responsive to my ardent vow.
O help me, thou the moments to beguile,
Aid me to hearken to the trivial chat
Of "Sarah Gamp" without impatient shrug,
Teach me to stroke the calmly purring cat,
Complacent dozing on the old hearthrug,
While "Mistress Harris" pulls and tugs in pain,
Her lot lamenting with recurrent groan,
Vowing she never will be caught again:
Hail, Patience, come, and be thou all my own.

VACANCIES.

East London Hospital for Children.—Assistant Physician. Honorary. Attendance required two afternoons each week. Applications to be sent to the Secretary on or before the 22nd inst. (See Advt.)

Kilcock Dispensary, Colbridge Union.—Medical Officer. Salary, £100 per annum. Applications to Hon. Sec.

Louisburgh No. 1 Dispensary, Westport Union.—Medical Officer. Salary, £100 per annum. Applications to Hon. Sec.

Bradford Infirmary.—Resident Medical Officer. Salary, £110, with board, &c. Applications to the Secretary, 65 Market Street.

University College Hospital, London.—Resident Medical Officer. Information as to the duties and emoluments to be had of the Secretary.

Dental Hospital of London.—Assistant Dental Surgeon. Honorary. Applications to the Hon. Sec. by the 14th inst.

St. Saviour's Union, Surrey.—Medical Officer for the 9th District. Salary, £130 inclusive. Endorsed applications to the Clerk's Offices, John Street, Blackfriars.

Royston Union, Herts.—Medical Officer for No. 5 District. Average remuneration by fees about £67 per annum. Applications to the Clerk of the Guardians.

APPOINTMENTS.

Betts, J., M.R.C.S.E., Medical Officer and Public Vaccinator for the No. 10 District of the Chelmsford Union.

Carmody, W. F. P., M.D., Medical Officer, Public Vaccinator, &c., for the Killanne Dispensary District of the Enniscorthy Union.

Kenny, B. J., L.R.C.P.Ed., L.R.C.S.I., Medical Officer to the Listowel Union Workhouse.

Parker, C. A., M.B., C.M., Medical Officer and Public Vaccinator for the Gosforth District of the Whitehaven Union.

Marriages.

Thomson—Mourant.—On March 1st, at St. Mark's Church, London, N.W., Wm. A. Thomson, F.R.C.S., L.R.Q.C.P.I., of Wembly, Middlesex, to Caroline Ella, only daughter of Colonel Mourant, St. Saviour's, Jersey.

Deaths.

Britton.—On Feb. 25, at Wellington Road, St. John's Wood, William Samuel Britton, M.R.C.S.E.

Gutch.—On Feb. 19, at Broughton, William Gutch, M.R.C.S.E., aged 84.

Scholfield.—On Feb. 21, at Todmorden, Samuel Scholfield, L.S.A.L., aged 56.

Tuck.—On Feb. 25, at Oxford, Francis Tuck, L.S.A.L., aged 44.

Tylor.—On Feb. 20, at Lansdown, Joseph Savory Tylor, M.D., aged 63.

SOME PRACTICAL REMARKS ON AURAL AFFECTIONS.

By H. Macnaughton Jones, M.D., M.Ch., F.R.C.S.I. and Edin.,

Surgeon to the Cork Ophthalmic and Aural Hospital, with Special Throat Department.

(*Continued from page* 182.)

EXAMINATION CONTINUED.

With Politzer's bag we can diagnose any perforation of the membrane which may escape our notice with the speculum, the air as it passes through the aperture conveying a characteristic whistling sound through the otoscope to the surgeon's ear. To examine a patient for perforation we must first carefully cleanse the meatus, and get a full and distinct view of the membrane. If the perforation is large there will be no difficulty in recognising its presence, the clean cut edges marking its size and position. In many instances the membrane may be almost entirely absent, and then we get a view of the red mucous membrane of the cavity of the tympanum which is often thickened and has a granular appearance. Hinton says that perforation of the membrane is never absolutely complete. Since I read this statement in 1874, I have had at least two cases in which after careful examination by sunlight, I could trace no vestige of membrane remaining. Frequently one meets cases where nothing but the rim of membrane close to its attachment remains. The malleus may be absent, or only a portion of the handle remain, or all the ossicles may have disappeared. I had two cases at the hospital lately which served admirably for demonstration to students of such extensive destruction. In both, the inner wall of the tympanum was completely exposed; in one, the fenestra ovalis and promontory were visible, and all the ossicles destroyed; in the other the stapes alone remained, and was seen applied firmly against the fenestra. But often with the speculum it is not easy to diagnose a pin-hole perforation or a slight rent or slit in the membrane. The presence of a minute dot of cerumen, a tiny blood clot on the membrane, a fine foreign body, an old scar or the cicatrix of a healed perforation may each be taken for a small perforation. We must then on all occasions when in doubt about perforation, confirm our diagnosis by Politzerising the ear; one end of the otoscope being placed in the surgeon's ear, and the other in the affected ear of the patient, the ear is, as I have previously described, inflated by the bag of Politzer, and if there be any aperture or chink the air whistles through it with the unmistakeable sound of perforation. It is then of importance in any ambiguous case not to arrive at a conclusion until the patient is Politzerised. In the great majority of cases, on fixing our eye well on the spot that we suspect is an aperture, and throwing a good light on it through the speculum, we can see the small bubbles of air issuing from the perforation or fluid oozing through it from the tympanum on inflation. Sometimes the hole is covered by a bright bubble of air, the glisten of which at once shows the seat of the perforation. All deceptive appearances are discovered by the adoption of these two methods: first by careful examination with the speculum and watching the suspicious spot on inflation; secondly, by the use of the otoscope and Politzer's bag. Not alone may we see the membrane perforated or destroyed, but adhesions may have taken place, either with or without perforations, which bind the membrane to the inner wall of the cavity or to the stapes and promontory. It may be thick and cartilaginous-looking, a condition frequently accompanying ankylosis of the bones. In arriving at a conclusion from the history, and especially from the nature, of the deafness as to the seat of the malady, when the cavity of the tympanum is affected, we have some general characteristic symptoms which guide us to a conclusion before we test the case with the tuning fork. Frequently a case is brought to us presenting some characteristic symptom. This may not be necessarily an attendant on the lesions of the tympanum referred to. But there are a certain set of symptoms, some of which are almost invariably met with in every case where we have

ankylosis, adhesions, or rigidity of the membrane lining the cavity of the tympanum. I cannot conceive, that any more lucid description of the typical symptoms which are complained of by the great majority of patients who have adhesions of the membrana tympani and ankylosis of the tympanic bones can be given than that of Mr. Toynbee. There are no more important passages in his unrivalled work on "Diseases of the Ear," than those in which he so clearly depicts those symptoms so well known to all aural surgeons, and which when described by a patient almost infallibly point to the seat and nature of the affection.

"Many patients will most distinctly hear a single voice, although low, but are puzzled to hear anything distinctly when two or more persons are speaking; others hear the voice, but cannot discriminate the words; others again can hear slow conversation, but cannot follow it when rapid. These symptoms show that the *adapting power* of the ear, dependent as already shown upon the ossicles and their muscles is at fault. But the history of the case, showing it to be one of slow hardening of the tympanic mucous membrane, together with the absence of all those symptoms which render it liable to be confounded with other diseases, as nervous deafness, obstruction of the Eustachian tube, &c., are unusually sufficient to enable an attentive observer to form a correct diagnosis."

"Thus the patient will hear perfectly a single distinct, voice, but a second voice intermingling completely disables him from hearing either; he having lost the power of rapidly adjusting his ear to suit the sound of the voice of the person immediately addressing him to the exclusion of that of the other. Yet another striking symptom of the early stages of the affection is the necessity of exercising an act of distinct volition in order to catch the sound of a voice, which ceases to be perceptible as soon as the effect is relaxed. It has, indeed, happened to me to receive patients whose complaints consisted not in being dull of hearing, since they could hear everything said in a room, but in not being able to do this without a prolonged effort of attention, the fatigue of which soon became intolerable. This latter condition is, of course, perfectly explicable from the more or less rigidity of the chain of bones in this disease, and the muscular effort consequently required to move and keep it in constant motion."

"Another symptom and one certainly characteristic of the later stages of this affection, but which it is not in my power to deny, may not also be present in another disease of the ear, is the immense improvement of the hearing which attends the patient's travelling in a carriage over a hard road, by which considerable vibration is communicated to his body; a vibration that doubtless in a degree shakes the chain of bones, and imparts to them a kind of vibratory movement, which permits the muscles, while it lasts, so to act on those bones as to restore more or less of their proper functions in adjusting the pressure on the labyrinth."

THE TUNING-FORK.

We now come to the most important step in the process of examination. The diagnosis of an obscure aural case is incomplete without the test of the tuning-fork. It is necessary here to repeat what has been elsewhere so well described by Politzer and other recent writers on this subject. "To Lucae," says Hinton "we owe the first scientific appreciation of this test." That knowledge is founded on the fact that if the external meatus is closed the sound of the tuning-fork placed on the head or against the teeth in the median line of the lower jaw, is increased.

It is not in keeping with the design of these papers to enter into the various physiological and acoustic reasons which have been assigned for this. It is sufficient to recognise the fact that vibrations passing through the solid media, the bones of the head, are intensified and the reflections increased when the external meatus is closed, in the normal state, and that those vibrations are prevented from escaping. If this obstruction is in the meatus or in the cavity of the tympanum, the effect is identical. Cerumen, a foreign body, polypus, obstruction from epithelium and hardened mucus in the external passage, or accumulated mucus in the cavity of the tympanum, will produce a similar effect. It is right, however, to say that in my experience this is not an absolute rule. There are persons whose hearing is very acute, and in whom there are no symptoms of any abnormal conditions, who do not hear the tuning-fork louder on closure. Some time since, in trying the tuning-fork on the heads of some bystanders and explaining the reasons for the use of the instrument in diagnosis, the accuracy of the theory received rather a blow when, the first person (a student) on whose head it was placed for experiment, who had remarkably good hearing and had never had anything wrong with his ears, declared that he did not hear the tuning-fork louder on closure of the meatus, but, of the two, less so. I tried him several times, with the same result. There was no cerumen, the membranes were healthy; all the others present were, however, influenced differently. This is not the only time that this very unusual result has been stated to me.

Nothing in the examination of the ear requires the exercise of so much patience as the trial with the tuning-fork. Each experiment should be repeated a few times, and the patient kept in ignorance of the result expected. Deaf patients, especially the poorer ones, are often intensely stupid. To arrive at a truthful conclusion, we must try their accuracy several times. It is a good plan to return to a previous step in the examination, and to repeat the question as to the intensity of the sound. Constantly, patients will at the same examination contradict assertions which a minute before they have made with the greatest confidence. I find it often at the hospital a trial not alone of the tuning-fork, but still more of my patience, to elicit the truth which they quite unintentionally obscure. I generally adopt the following method of testing, whether the deafness be unilateral or bilateral:—

1. Ascertain if the sound is heard louder in either ear, the meatus of each remaining open.

2. If the sound is heard louder in either ear, or the contrary, the meatus of each having been closed alternately with the finger.

3. If the sound, as heard with the meatus of each ear closed, is louder as contrasted with its intensity when both ears are open. This I do by making the patient, with his thumbs in readiness, quickly close the ears on placing the tuning-fork on his head, and by testing him alternately with both the ears open and closed.

Let us take a few uncomplicated examples. We have by the speculum excluded any cause which can exist in the external meatus, such as cerumen, polypus, epidermis, or foreign body. We wish to arrive at a conclusion as to whether the deafness and tinnitus are due to tympanic obstruction or to disease of the nerve. First, a patient hears *badly in the right ear*, and well in the left. With the tuning-fork on the head in the first step of the examination, he hears it *loudest in the right ear*. The *presumption* is—*mucus in the cavity of the tympanum of that ear*. On closing the left ear the sound is intensified in it, equally, if not exceeding, that heard in the right one. On closing the right one the sound is not increased, as a rule. The diagnosis is complete in the vast majority of cases; it is one of obstruction in the cavity of the tympanum.

Secondly, a patient is *deaf in both ears*, with or without tinnitus. The tuning-fork placed on the head is *heard loudly and equally in both*, and there is *no difference, or very slight, on closure of either meatus*. We diagnose *mucus in the tympanum of each ear*.

Thirdly, a patient is *deaf in the right ear*, with or without tinnitus. The tuning-fork placed on his head is *heard louder in the left ear. We assume nervine deafness of the right ear. On closing the left ear, the sound is intensified in it; on closing the right, there is no difference.* In my experience in the majority of cases it is, of the two, *less*. We confirm the diagnosis of nervine deafness in the right ear.

Fourthly, a patient comes to us *deaf in both ears*, with or without tinnitus. The tuning-fork placed on the head, *he hears, perhaps, badly, and the sound dies rapidly away.* This can be ascertained by testing him as usual, and transferring the fork quickly to the observer's head or teeth, on the patient's making a signal that the sound has disappeared. It is possible *he may not hear the tuning-fork at all* when placed on the head, and we must transfer it to the teeth before the vibrations are conveyed. Closure of either ear produces little difference (*Hinton thinks slightly increases the sound*); of the two, I am inclined more frequently to think, lessens it. We diagnose *nervine deafness of both ears.*

Such is, up to the present, the result of my experience in the majority of cases. On the disputed point of the patient hearing the sound less distinctly on closing the deaf ear (Roosà) in a case of uncomplicated nervine deafness, or its being slightly intensified (Hinton), after examining many hundreds of cases, I believe that the result is variable. This may arise from some error in diagnosis. Complications may exist which escape observation, and may be outside our power of diagnosis. Such complications existing in the tympanum, and which involve its membrane and ossicles, would influence the result. That they co-exist frequently with nervine deafness is, of course, true, and hence it may be the case, that much of the difficulty lies in this source of error.

Though the above rules as regards the diagnostic value of the tuning-fork are generally found to lead to a correct conclusion, still anomalous cases are constantly occurring in a large aural practice which I do not pretend to account for, and which are more or less at variance with them. For instance, within the past few days these three cases have come under my notice.

Case 1.—J. N., age 51. Right ear deaf for two years; the deafness came on after cold; he has a "humming" tinnitus; there has been an old syphilitic history, and at present he suffers from his throat from the same cause. He has never had any pain or discharge. With the right ear the watch is heard barely on contact, with the left at half an inch. He inflates both membranes—the right faintly, the left with a moist crackle. The membrana tympani of the right ear is divided into two very hollow pockets; it is unusually white, and the malleus is displaced, the handle being prominent. In the left ear the malleus is not visible, the membrane is considerably drawn in, and extremely concave and dull. The tuning-fork he hears best in the right ear. Closure of either meatus makes little difference, the sound remaining most distinct in the right ear, though not so loud as when that ear is open; on closing the meatus of each ear the sound is less than when both ears are open.

Case 2.—J. H., age 49. The left ear has been very deaf for two years, with constant "singing." He found the right getting similarly affected about one year since, when he consulted me, and was then relieved of the tinnitus in both ears and the hearing of the right ear considerably improved. His hearing distance now is $\frac{6}{50}$ with the right, and the watch is not heard in contact with the left. The tinnitus has returned, and it is for relief from this symptom he has come again. The membranes show but little change from the normal state; he inflates both ears with a dry sound; the tuning-fork is heard loudest in the right (the good) ear; on closing the right the sound is increased; closure of the left, he fancies, rather intensifies the sound in the right; when both ears are closed the sound is slightly lessened.

Case 3.—P. K., age 16. When seven years old he had scarlatina, and after it the right ear remained deaf; he has never had any pain or tinnitus, and does not recollect any discharge; the hearing distance of the left ear is normal, of the right $\frac{1}{50}$; the external meatus of the right ear is healthy; the membrane is congested, the triangular spot is obliterated, and there is what appears to be a small scar of an old perforation; otherwise its shape is normal. He inflates both membranes well; the tuning-fork is heard *alike in both ears.* With the right closed the sound is loudest, with the left ear closed it still remains loudest in the right; when both ears are closed it is louder than when both are open.

These three cases I cite as they occurred while writing this paper, and I tested each frequently and cautiously to correct any error. They are all very intelligent. In these cases I am inclined to believe the mischief was confined to the cavity of the tympanum and the ossicles, probably the effects of long-retained secretion, low inflammatory states of the lining membranes, adhesion, and partial ankylosis of the bones. There was little yielding of the membrane on inflation, no improvement on suction with the pneumatic speculum, and in all three cases its concave and thickened appearance verified the diagnosis.

To prove, however, the utility of the tuning fork, I cite fully this case.

Mrs. —, widow lady, age 52, consulted me in **March,** 1876, for deafness and tinnitus in both ears. On examination I found that the cause of the affection was a slight accumulation of cerumen, the removal of which and subsequent inflation completely cured her. In December last she again consulted me. She then suffered from an "unpleasant, stupid, sensation in the head, giddiness, tendency to fall, and general debility," accompanied by complete deafness in the left ear, and "noises like the sea roaring." There was a history of irregularity during the menopause. Menstruation had ceased for one year and two months previously; she had been slightly unwell during the past month. She had several pregnancies, the last occurring in 1866. She had a general anæmic look and feeble circulation; the heart sounds were normal but weak; there was no albumen in the urine; the secretions were fairly regular. On examining the deaf ear, I found the watch barely heard on contact, the external meatus healthy, the membrana tympani healthy and normal in shape and appearance, the Eustachian tube free. She could inflate the membrane, but not well, and the normal rustle was represented by a moist gurgle. I assumed a recent accumulation of mucus in the cavity of the tympanum, and a collapsed Eustachian tube. The mucous membrane of the throat was pale and anæmic looking. On placing the tuning fork on her head she said "she heard it nearly altogether in the right (the deaf) ear." I passed the Eustachian catheter and syringed out the ear with a warm solution of chloride of ammonium (gr. iv. ad. ℥i). I then Politzerised her a few times through the opposite nostril. On testing her immediately after inflation her hearing distance was $\frac{3}{50}$. This treatment, added to general attention to the debilitated constitutional state by tonics, &c., was continued, and gradually the noises completely disappeared. On the third of the month she visited me, the hearing perfectly restored and the tinnitus gone.

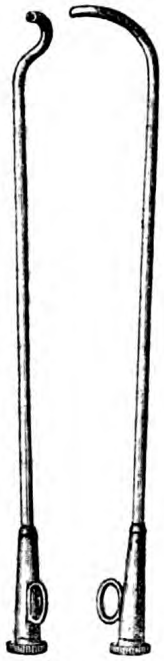
To understand the use of the catheter, I would recommend all those who wish to study its mode of introduction on the dead body to make the usual sections of the skull required to expose the pharynx and nasal fossa. This is easily done by sawing through the base of the skull behind the styloid processes and the attachment of the pharynx, the other section being made vertically through the nose at either side of the septum. In this way, if the section be carefully made and the soft parts uninjured, the inner and outer wall of the nasal fossa are preserved. The various muscles which act on the orifice of the tube, the posterior nares, the depression behind the tube, and the tube itself can be examined. Beautiful illustrations of these sections can be seen in plates 26 and 28 of Ellis's "Illustrations of Dissections." These I use myself for demonstration.

The chief facts of practical importance which we have to recollect when we undertake the passage of the catheter are as follows:—The Eustachian tube is about one inch and a half in length, ("35 mm.; 24 mm. of which belong to the cartilaginous, 11 mm. to the osseous canal," Tröltsch translated by Hinton), the osseous portion in the temporal bone being three quarters of an inch, and

the cartilaginous portion one inch. The tube is funnel-shaped, its narrowest part being at the junction of the osseous with the cartilaginous portion. This tube passes from the anterior wall of the tympanum downwards, forwards and inwards, to terminate at the pharyngeal orifice, which projects as the opening of the trumpet, close behind the internal pterygoid plate, on a level with the inferior turbinated bone, at the back part of the inferior meatus of the nose. Two lips bound this orifice, one posterior, directed downwards, the other anterior, turned upwards. It measures (Tröltsch) "9 mm. in height, 5 mm. in width." This faucial orifice (Toynbee) is nearly half an inch long. The pharyngeal end is the widest portion of the canal, and is composed both of cartilage and fibrous membrane. The mucous surfaces of the membrane which line this canal are in a state of apposition, the two patent points being the faucial orifice and the commencement of the osseous portion (Tröltsch). This arrangement converts the Eustachian tube into a form of valve, which in a state of rest is closed, and which opens and closes at each act of deglutition, in consequence of the action of the tensor and levator palati muscles, the former dilating the opening (Rüdinger and Tröltsch), the latter muscle drawing the inferior curved edge of the orifice of the tube into a straight line upwards. The palato-pharyngeal muscle assists in fixing the cartilaginous portion. This action we are frequently performing in the swallowing of our saliva. It is this action of the palatal muscles that we take advantage of in Politzerising and inflating the membrane, during the act of swallowing the water; the orifices of the Eustachian tubes then becoming pervious. We may epitomise the uses of the valvular canal thus :—

1. It permits of an exchange of air to the cavity of the tympanum, thus it forms an outlet for abnormal secretions and prevents their accumulation in the tympanum.
2. It prevents the rarefaction of the air in the tympanum by the successive acts of swallowing when air can enter the cavity at each act.
3. It maintains a condition of equilibrium between the air in the tympanum and the atmosphere.
4. It may influence the vibration of the membrane and the resulting sonorous effects on the tympanic cavity; (Bernstein) clinical effects would appear to verify the suggestion.

Fig. 12.



This is one instrument, profile and front view.

The valvular action of the tube has the most important bearing on our knowledge of Eustachian deafness. Closure or occlusion of the tube leads to rarefaction of the air in the tympanum, which, while it may filter out, is not restored or renewed. Then follows an accumulation of mucus in the tympanum, and an increased concavity of the membrane, and finally hardening of the secretion, contraction of the membrana tympani, and thickening and adhesion of the membrane lining the cavity with accompanying changes in the ossicles. The annexed figure represents a form of the Eustachian catheter, the double curved catheter of Dr. Noyes, of New York. The mode of passing the instrument we shall now proceed to consider.

ABSTRACT OF REPORT OF A CASE RESEMBLING ONE OF ADDISON'S DISEASE. (a)

By George F. Duffey, M.D.,
Physician to Mercer's Hospital, &c.

This was a case which presented many features resembling the supra-renal melasma of Addison. The patient was an intemperate car-driver, thirty-two years of age, who came under Dr. Duffey's care in Mercer's Hospital, with œdema of the lower extremities and albuminuria. There was also a peculiar dark-brownish discoloration of his lower lip, blackish spots on the buccal mucous membrane and tongue, and a nearly general dark, tawny-brown cutaneous pigmentation. He had noticed that he was getting very dark about five weeks before he presented himself at hospital, and he felt himself growing weak, and listless. He could ascribe no cause for his illness, and had never had syphilis, malarial fever, or, in fact, any previous sickness.

Dr. Duffey described minutely and in detail the state of the man on admission. The discoloration was more marked and deepest in hue on the groins, flank, and axillæ. The penis, nipples, and their areolæ were deeply stained. The discoloured integument was universally and irregularly mottled over with small darker spots resembling ephelides. The sclerotics were "pearly-white." The patient was extremely feeble, any exertion brought on breathlessness, his temperature was subnormal, and he became extremely apathetic and low-spirited. The œdema soon disappeared, but the albuminuria continued, and he had persistent headache for a month.

Warm baths, which acted well as diaphoretics, had no effect on the cutaneous change; but, as he became better under the administration of phosphorus and iron, the labial patches first disappeared, and then the deposits of pigment in the mouth and on the tongue. Subsequently it was observed that the affected portions of the skin had become of a somewhat lighter tint, and it was noticed that, corresponding to the site of a blister—which had been applied over the left side when he had been suffering from pain in the region of the spleen—the cutis was of a much paler colour than the surrounding integument. This was opposed to the usual result following the application of a blister in Addison's disease, increased pigmentation subsequent to vesication being the rule. Soon after his admission, and mainly as a test experiment, a small blister was applied to a portion of the unpigmented skin of his back; no discolouration ensued. These facts, coupled with the partial and mottled, instead of uniform and general, discoloration now observed; the disappearance of the patches from the lips and from the mouth; the greatly improved general health, strength, and spirits of the man; his good appetite; the absence of emaciation and gastric symptoms, and the perceptible clearing up of the discoloration now following the frequent use of warm alkaline baths and soap, caused a doubt as to whether the case was really one of Addison's disease

(a) Read before the Medical Society of the College of Physicians, Ireland. The debate will be found at p. 206.

associated with renal disease, as at first diagnosed, or not. It was well known that discoloration of the skin might be induced by a variety of causes, independently of any affection of the supra-renal capsules. In this case the discoloration being neither raised, in patches, itchy, or scurfy, in no way resembled pityriasis versicolor; there was no detectable hepatic or tubercular disease, and, if not the result of supra-renal melasma, or of the cachexia induced by the renal disease, the change of colour in the skin was most probably an example of that condition to which Vogt has given the name of "Vagabonden-Krankheit," and which Greenhow has rendered into English as "Vagabond's Discoloration."

Against this view were—

1. The age of the patient. Vagabond's discoloration is most frequently seen in elderly persons of very indigent circumstances and uncleanly habits, especially when infested by vermin; while Addison's disease very seldom occurs in persons past middle age. (*a*) 56·75 per cent. of the 37 cases of Addison's disease tabulated by Dr. Hayden (*b*) occurred between the ages of twenty and forty years.

2. The presence, at first, of associated pigmentation of the mucous membrane and cutaneous discoloration.

3. The constitutional symptoms and subnormal temperature.

4. The non-effect, at first, of hot baths, the pigmentation actually becoming darker during their use.

In favour of Vagabond's discoloration were—

1. The fact of its being paler on the face, hands, and other exposed parts.

2. The partial discoloration of the skin.

3. The surface left after blistering being pale.

4. The remarkable diminution of the discoloration after the use of warm alkaline baths and soap.

5. The constitutional symptoms present being referable to a distinct cause, and one of the most characteristic constitutional symptoms of Addison's disease—viz., obstinate and uncontrollable vomiting, being wanting.

In reply to a communication from Dr. Duffey, Dr. Greenhow had informed him that personally he had not seen a case in which discoloration of the mucous membrane of the mouth had disappeared, but that he had been told of such a case by a hospital physician of high reputation. Also, in reply to a query as to the probable causation of the abnormal pigmentation on the buccal mucous membrane and lip in the case under notice, supposing it to be one of Vagabond's discoloration, and in his own case Dr. Greenhow said he could not explain the pigmentation of the lips, &c., in his case of Vagabond's discoloration when he was watching the case, and was still equally at a loss to do so. The difficulty of diagnosis in the case "lay in the fact that, co-existing with the general discoloration of skin were some constitutional symptoms and local signs which at first sight raised the question whether Addison's disease might not also be present."

Clinical Records.

STEEVEN'S HOSPITAL.

Cases of Traumatic Tetanus. (*c*)

By HENRY J. TWEEDY,
Resident Surgeon.

IN these days of progress it is a humiliating reflection that while new facts are constantly being brought to light in surgery and pathology, there are still many problems in disease which remain to be solved. New remedies and new theories are continually turning up, only to be in their turn rejected in favour of others more plausible. Much, however, is being done towards clearing up many of the difficulties which perplex us. The true nature of tetanus has long been a subject of minute and careful investigation, but without any very tangible results. Some light, however, has been recently thrown upon its pathology, and we may feel sure that further discoveries on the subject will reward the patient and zealous research which is each day approaching nearer the truth. With regard to the treatment of tetanus, less can be said; for though much can be done for the alleviation of suffering, and in some instances for the prolongation of life, medicine and surgery are as yet unable to reach with any degree of certainty the source of the disease.

To the kind permission of Mr. Colles, the Society is indebted for the brief clinical history of three cases of tetanus, which occurred recently in the wards of Steeven's Hospital. These cases presented, each, features of peculiar interest, of which a careful record was kept by the clinical registrar, Dr. Fox. One of the cases recovered—fortunately for himself if not for pathology.—*Post-mortem* examinations were made on the other two, and a number of sections of the spinal cord, made by Dr. McDonnell, who will lay before the Society this evening the result of his investigations.

The first case was that of a man, aged 32, tall, well built, and exceedingly muscular, employed in a well known distillery. He had been engaged in oiling a portion of a steam engine in rapid motion, and whilst doing so, through some carelessness or inadvertence on his part, a portion of the machinery, known as the crank, struck him with great force on the left foot. He was found, on examination, but slightly collapsed, though he had lost a considerable quantity of blood, but his foot was fearfully mangled. There was a large lacerated wound on the instep, four inches in length by two in breadth, the foot was completely punctured through, portions of the second and third metatarsal bones and also of the tarsus itself being literally ground into small fragments, and a jagged rent appeared on the plantar surface. It was at once proposed to amputate, but the unfortunate man obstinately refused to allow any operative interference; so the wound was simply plugged with charpie, soaked in turpentine (as there was considerable oozing of blood), and then dressed with carbolized oil.

Two days afterwards, finding himself much worse, the patient was anxious for the operation which he had refused on the previous day; but constitutional disturbance was now so evident in the rapid bounding pulse, the increased temperature and the occurrence of rigors, it was felt that the limb could not be removed with safety.

No improvement took place in his condition, the wound failed to take on healthy action, and on the fourth day not only the wound itself but the entire foot was beginning to assume a gangrenous appearance. Towards evening the patient became delirious, and for two days longer he continued in the same condition, raving for the greater part of the time, but having occasional lucid intervals, the same treatment being continued as before. The next following morning, however (the seventh after his accident), about 3 o'clock, symptoms of locked-jaw showed themselves unmistakeably. The abdomen was hard, the head and neck fixed, profuse sweating, and that peculiar expression of countenance which once seen can never be forgotten. He was ordered hypodermic injections of 1-3rd grain of the calabar bean every second hour, gelatine calabarized discs being used for the purpose; his temperature was now 100·4°, and his pulse 100; the delirium, moreover, quite disappeared.

The day following (the eighth day) all the symptoms had become aggravated, and he had violent spasms every hour or so, but they increased in violence and frequency as the day wore on; the calabar bean did not seem to have the slightest effect, though the dose was now increased to ½ gr. every hour and a-half, and indeed the very introduction of

(*a*) Greenhow. Croonian Lectures, p. 43; and Clin. Soc. Trans., Vol. IX., p. 46.
(*b*) *Dublin Journal of Medical Science*, Feb. 1865.
(*c*) Read before the Surgical Society of Ireland. The discussion will be found on page 165.

the needle, and also each cough, brought on spasms. The only agent that gave the slightest relief was the nitrit of amyl, and this was certainly wonderfully efficacious in cutting short the spasms. Three drops of this were poured on a handkerchief and held to the patient's nose, as soon as a spasm came on; the effect was instantaneous; the pulse became at first full, slow, and laboured, and in a few seconds more began to fail altogether; while the muscles at once relaxed, and the spasm was over for the time being. As the disease progressed and the patient grew weaker, two drops only could be administered, and finally one was as much as he could bear, and that administered with the greatest caution.

There is but little more to be said of the case. There was only opisthotonos but no pleurosthotonos even on the injured side. He gradually grew worse and worse, and breathed his last early on the morning of the tenth day.

The second case was that of a fine healthy boy, 18 years of age, employed in a mill at Blanchards-town. On the morning he met with his accident, he was engaged in oiling a portion of revolving machinery, when his left hand was caught between two cog wheels, and before he could extricate himself or stop the machinery, the arm was drawn in, crushed, and mangled. He was at once removed to hospital. On examination there he was found slightly collapsed. There was a laceration of the left hand, and the middle finger fractured in two places. There was also a large irregular lacerated wound extending from about three inches above the olecranon process to two inches below it, on the outer and back part of the arm, partially opening the elbow-joint. Amputation was proposed, but as there was not any very considerable loss of integument, and no vessel of importance had been divided, it was decided to give the limb a chance. The wounds were accordingly dressed with carbolized oil, and the hand and arm placed in a splint, and the boy was soon asleep under the influence of a sedative draught. Days now passed on, the wounds looking healthy, the patient sleeping well, and nothing untoward occurring; but towards the afternoon of the seventh day after the accident, the nurse in charge of the case brought the significant information that the boy was complaining of pain in the back of his neck, and also found some difficulty in masticating his food. He was at once ordered the extract of calabar bean in doses of one-third of a grain every second hour.

Towards morning the symptoms had become much better marked. There was now no mistaking the nature of the malady. The patient slept but little. He could scarcely open his mouth. The masseter muscles were in a state of extreme rigidity, the abdomen hard and tense. Still the temperature was not increased nor the pulse accelerated.

In consequence of the locked-jaw, it was found impossible to continue the pills of calabar bean, so some calabarized discs were procured, as in the former case (one-sixth of a grain each); one of these, one-sixth of a grain, was dissolved in a few minims of distilled water, and injected hypodermically every second hour, but as it did not seem to have the smallest effect, the injection was increased to one-third of a grain. He was likewise given a grain of calomel every fourth hour.

The ninth day arrived, but brought no mitigation of the symptoms. The jaws were now completely closed, the tension of the muscles unrelaxed, constant twitchings, and occasional attacks of spasms (opisthotonos). The wounds assumed a most unhealthy aspect, and discharged a quantity of exceedingly fœtid sero-purulent matter. Still the pulse continued at 85, and the temperature did not rise. He was now fed by enemata of beef-tea, eggs and brandy, and was ordered in addition to the calomel (which was only administered with great difficulty), five grains of quinine every fourth hour.

On the tenth day the temperature had risen to 101°, the pulse was small and wiry, and beating 125 to the minute. He had passed a wretched night. The spasms had increased in frequence and severity, occurring every ten minutes. The whole muscular system was in a state of intense rigidity, and there was profuse diaphoresis; enemata of tobacco were tried without the slightest effect, the spasms continued with unbated violence, each leaving the sufferer weaker than the previous one, till gradually sinking, he died at ten o'clock the same evening.

The third case, though a very tedious and protracted one, was a pleasant contrast to the two former, as it resulted in the recovery of the patient, but, like the former, it was the result of a machinery accident.

R—— M——, aged 19, a slight delicate looking lad, was employed at some mills in the vicinity of Dublin. On the day of the occurrence, he had occasion to remove a leather belt or girdle from a wheel while in rapid motion; in doing so his left hand was caught between the pulley and the shaft, and received a very severe lacerated wound; fingers, hand, and wrist being all more or less involved. He was conveyed to Hospital, where for some days he progressed favourably, his case presenting no feature of more than ordinary interest. Twelve days, however, subsequent to the receipt of the injury, a slight stiffness of the jaws was noticed when the patient was at breakfast. He had, likewise, repeated fits of yawning. Camphor dissolved in milk was ordered for him, to be taken as a drink *ad libitum*.

On the thirteenth day the locked-jaw was better marked, still he had passed a good night, had no spasms of any kind, the temperature was normal, and the pulse tranquil. The injured hand was looking well, and continued to be dressed with the ordinary Hospital warm dressing (gum elemi and turpentine), and constantly renewed poultices of linseed.

On the fourteenth day the symptoms were still more apparent; the abdominal muscles somewhat rigid, the trismus so far increased as to necessitate the use of a gag.

The fifteenth day found the pulse and temperature still in a normal condition. Both sterno-mastoid muscles were very rigid, but there were no spasms, no diaphoresis, and comparatively little difficulty in eating and drinking.

On the sixteenth day the temperature had risen to 100°; there were slight twitchings of the muscles on the injured side, especially when the patient was falling asleep. There was also considerable sweating. Poultices of tobacco leaves were now kept constantly applied to injured limb.

On the seventeenth day the symptoms had all become intensified, an attack of bronchitis formed an additional complication, and regular spasms now appeared for the first time, accompanying each fit of coughing. The injured side was most affected, but there was at the same time slight opisthotonos. Mercurial inunction to the spine was now directed, and at the same time ice was kept constantly applied to the same region. He was also ordered pills containing two grains of quinine, one grain of calomel, and one grain of extract of belladonna, one to be given every second hour. He was able to take these, as the timely use of the gag had prevented the jaws from closing completely.

The nineteenth day found him in a still worse condition. He was now ordered ten grains of the chloral hydrate every second hour. His temperature was 101°, and his pulse 130, at which they both continued almost stationary for the next seven days. For the following two days there was no change worth noticing; but on the twenty-second day the spasms were limited entirely to the left side, and followed each effort to cough or swallow. The index and ring fingers of the hand had become partly gangrenous, and the next day the first phalanx of the index finger had completely separated. All this time the patient bore his sufferings with great fortitude, and, happily, his appetite did not fail, as all through his illness he was able to partake freely of nourishment and stimulants.

During the twenty-third, twenty-fourth, and twenty-fifth days the disease was at its height—profuse perspirations, frequent spasms, general muscular rigidity, and some difficulty in micturition. The mercury now began to have some effect on the system; the gums were be-

coming sore, and there was slight salivation. The temperature came down to 100°, and the patient seemed slightly better. On the following day (the twenty-seventh of his illness) the improvement was still more evident; the spasms were less frequent, and the other symptoms proportionately diminished. His temperature, too, had fallen to 98·5°, and remained so. In fact, from this date he made a slow, but steady, recovery, and on the thirty-seventh day he was up, and walked about for the first time. He was shortly able to leave hospital, and was sent to the country for some weeks. Since then he has twice visited the Institution, to show himself. He is in excellent health, and not a whit the worse for the terrible ordeal he has gone through.

These, gentlemen, are the three cases, and there are one or two points in connection with them which would seem worthy of notice.

The first two cases only confirmed the general rule, that where the disease manifests itself before the tenth day the result is almost inevitably fatal. Singularly enough, the two cases followed very closely on each other. The first was admitted on the 9th of June, and died on the 19th; the second was admitted on the 15th of the same month, and died on the 25th—so that they were both actually in the same ward at the same time, and in the second case the symptoms manifested themselves three days after the death of the first. At the time there seemed to be a kind of epidemic (if the word be admissible) of the disease, as cases were stated to have occurred almost simultaneously at several of the Dublin hospitals.

With regard to the third case, the tetanic symptoms did not appear till the twelfth day. He was (as we have noticed) a slight, delicate boy, and yet he weathered a long and tedious illness, while two others much more robust were cut off in a few days. It was a singular fact that his grandfather had also recovered from tetanus. You shall hear the story, without comment, as I heard it from the boy's mother.

She related that her father had been in Cork Street Hospital with the locked-jaw; that a great many doctors saw him, and said he had no chance; that then old Surgeon Cusack was sent for. He examined him, and then stood looking at him carefully and pulling his lower lip; and at last (according to her account) pronounced the oracular words, "If he winks with his right eye he will get well, but if he winks with his left he will die." He winked with his right eye, said the old lady, most triumphantly, and accordingly he recovered.

Transactions of Societies.

ROYAL MEDICAL AND CHIRURGICAL SOCIETY.

THE most interesting paper read at the last meeting of this Society was that read by Mr. T. Spencer Wells, F.R.C.S., on

THREE HUNDRED ADDITIONAL CASES OF OVARIOTOMY, WITH REMARKS ON DRAINAGE OF THE PERITONEAL CAVITY.

Mr. Wells arranged in a table all the cases in which he had operated, from the fifth to the 300th case, distinguishing the operations performed in the Samaritan Hospital from those in private houses or nursing institutions. The mortality in the first 100 of the additional cases was 29, in the second and third 100, 24, a mortality which nearly corresponds with that in the 500 cases previously reported. But in the latter series there were more operations performed under unfavourable, or almost hopeless, conditions; inasmuch as the author had been encouraged by recoveries in bad cases, to advise the operation or give a favourable opinion in cases in which he would have formerly declined to operate. In discussing the influence of drainage of the peritoneal cavity upon the success of the operation, Mr. Wells traced the history of the practice from the time when drainage by the ligature securing the pedicle was the rule, to its disuse when the extra-peritoneal treatment of the pedicle and its intra-peritoneal method by ligature or cautery was generally adopted. He thought that the occasional use of puncture and drainage to be no reason for preferring, as had been recommended, at the time of operation for drainage or injection in every case. In the 300 cases under consideration, he had only made provision for drainage at the time of the operation in eight, and in only eleven other cases did fluid afterwards escape by opening of some portion of the wound, or by vaginal puncture. He did not consider that drainage should be a general practice in ovariotomy, but should be reserved for exceptional cases where collection of blood or serum may be expected to follow the operation. Mr. Wells also described the different methods of drainage, as well as the use of simple and antiseptic injections, but the question of the more complete adoption of antiseptic precautions before, during, and after the operation, was reserved for another occasion.

Mr. NUNN said that Mr. Wells was to be thanked for his bold innovation in the method of treating the peritoneal cavity with a view to combat inflammatory mischief.

Mr. BRYANT was glad to hear the opinion of the author respecting drainage of the peritoneal cavity. Drainage was resorted to in five cases recently under his care, of which four recovered, and in three of them he considered the good result was due to the drainage. Enormous quantities of serum sometimes drained away, which otherwise must either have been absorbed, or have undergone septic changes. Of his five cases, the glass tube had been used in three, and the ordinary india-rubber tube in two.

Mr. BARWELL complimented the author of the paper on his large experience and great success, and asked for information about the management of the drainage tubes.

Mr. T. SMITH said that the results obtained by Mr. Spencer Wells were as good as they could be, especially considering the unfavourable circumstances under which the operation was often performed. A more careful selection of cases by less courageous operation might be even more successful, but then such selections might entail the sacrifice of many lives. Mr. Smith then animadverted upon the contrast which, in an early report of the Samaritan Free Hospital, had been drawn between the large mortality from the operation in the general hospitals of London and the small mortality at the Samaritan. But it should be borne in mind that the more unfavourable statistics were compiled at a time when the operation was admittedly less successful than at present, and that the registrars at the general hospitals had been in the habit of including in their returns the cases in which the operation had to be abandoned before its completion. But in the statistics of the Samaritan Hospital, and of ovariotomists generally, only cases of completed ovariotomy were included, and he believed that the mortality would be greatly increased if the results of the incomplete operations were taken into account. Moreover, the success of one surgeon remarkably experienced in the operation had been contrasted with that of many surgeons, some of whom were probably not equally qualified to perform the operation, and who had to perform the operation without such skilled nursing and specially qualified assistants as were desirable. He believed that the great success of Mr. Wells was a personal success due to his great experience, sound judgment, courage, and fertility of resource.

Mr. HULKE also spoke of the high mortality of the operation at the general hospitals, but stated that at the Middlesex Hospital the adoption of isolation had greatly reduced the mortality.

Dr. GRAILY HEWITT congratulated Mr. Wells upon his success in this department of surgery. Dr. Hewitt had himself operated thirty-five times, and although his success was not so great as that of Mr. Wells, he was satisfied with it. Dr. Hewitt advocated bringing the pedicle to the wound and treating it externally. Mr. Wells had not mentioned the use of the cautery which he (Dr. Hewitt) preferred to ligature when it could be employed.

Sir JAMES PAGET, in calling upon Mr. Wells to reply, said, that he deemed the operation of ovariotomy as perfected by Mr. Wells to be one of the greatest achievements of surgery in this country, and the gain was not limited to ovariotomy, but that the whole principles of surgery, and especially of operations involving the peritoneum, had been improved by the success and study of these cases.

Mr. SPENCER WELLS, in reply, said, the escape of a large quantity of fluid in Mr. Bryant's cases did not show that the drainage-tube was necessary. The tube itself might act as an irritant. In answer to Mr. Barwell, he said that the presence of fluid could be felt *per vaginam*, and as a drainage-tube could be inserted by introducing a trocar into the pos-

terior *cul-de-sac*, instead of opening up the abdominal wound. With regard to Mr. Smith's remarks, he believed that the report of the Samaritan Free Hospital, for which, however, he was not responsible, had done good. The operations at that hospital were not all done by himself. Last year fifteen cases were under the care of Dr. Bantock and Mr. Thornton, only one of which proved fatal. It would not be fair to class together the incompleted and the completed operations, but he did not think the mortality among the former was high. In the present series of cases very few of the incompleted operations were included. Much, he thought, might be attributed to good sanitary conditions and good nursing, but he saw no reason why those should not be obtained at the general hospitals. His view as to the value of antiseptics was unsettled, and he had some intention of testing it by treating 100 cases on that plan. Since then he had had a series of twenty-seven successful cases consecutively, a result which would have been attributed to the antiseptics had they been tried. He had not often used the cautery, which, although a good measure, was not, in his opinion, to be preferred to the clamp or ligature.

MEDICAL SOCIETY OF THE COLLEGE OF PHYSICIANS OF IRELAND.

At the meeting on Wednesday, February 7, 1877, Dr. Hayden, V.P., occupied the chair.

Dr. Duffey brought under the notice of the Society

A CASE RESEMBLING ONE OF ADDISON'S DISEASE,

which will be found on page 202.

Previous to the discussion on the paper which ensued the subject of it was introduced and examined by the members of the society present.

The Chairman said, the main question in connection with the paper had reference to diagnosis; and he was inclined to agree very much in the view taken by Dr. Duffey, which was now confirmed by their inspection of the patient; viz., that the case was not one of genuine Addison's disease. He had seen the man with Dr. Duffey, in Mercer's Hospital, some months ago, and he certainly then presented very many of the features of the genuine disease. He had then discoloured lips and skin; he was exceedingly low, and less robust than he was at present; and the whole aspect of the case made him suspect that it would turn out to be one of Addison's disease. Dr. Duffey had admirably summarised the general features of the disease with which many members present were familiar. The constitutional symptoms were defective, and recognition of the disease was surrounded with very great difficulty. In a case that he (Dr. Hayden) had published some years ago, the same symptoms as seen in Dr. Duffey's patient, were observable, including the apathy; there was an almost total indifference to what passed about the patient, and his carelessness as to the result of the disease was almost remarkable. This was well expressed in the face of the woman, aged thirty-eight, a coloured photograph of which case he now exhibited. In another case, included in Greenhow's tables, the patient was a boy, aged sixteen, and the disease ran a rapid course.

Surgeon-Major Jackson, C.B., stated that a relative of his own was attacked about a year ago with somewhat similar symptoms to those that occurred in Dr. Duffey's case. He had large dark brown patches on his shoulders, neck, and abdomen, in the axilla, and around the breast and nipples. He suffered also from general debility. He also suffered from anorexia, constipation, and difficult digestion. The temperature was sub-normal; the urine was albuminous. and this condition persisted after an improvement in the patient's health had taken place. Subsequently the bronze spots disappeared, and his skin assumed a much fairer tint than even before his illness. Sometime afterwards his vision became impaired, and Mr. Wilson found that he had hæmorrhagic retinitis. He improved until about a fortnight since, when, after feeling out of sorts for a week, he had an attack of asphasia. The dark-coloured patches again appeared on his shoulders. He gradually improved as regards the asphasia, but the albuminous urine had continued during the whole time of his illness. The teeth were black during the colouration of the skin, but when he commenced to gain flesh, the skin got more the colour which it has in cases of Bright's disease, and the teeth again became quite clean.

Dr. Nixon, after detailing the facts of a case under his care, in which he had no doubt, from the presence of the constitutional symptoms of the so-called supra-renal melasma, that the man had Addison's disease, proceeded to refer at length to the pathology of Addison's disease, founding his remark on the views expressed by Jaccoud in the article referred to by Dr. Duffey. That writer assumed that the disease was the result of an alteration in the great sympathetic nerve-ganglia of the abdomen. A special function of these ganglia was to preside over pigmentation and the general condition of the arterial system. Under certain circumstances, these ganglia might be irritated, and as a consequence gave rise to the different symptoms so common to supra-renal disease. Disease of the supra-renal capsules was not, however, the sole cause of the symptoms we are familiar with under the name of Addison's disease. Other abdominal lesions might produce the same result, but only by acting on the semi-lunar ganglia in the same way that disease of the supra-renal capsules does. But from the extremely large number of nerves that lead to the supra-renal capsules, disease of their substance offered a greater means of transmitting irritation to the semi-lunar ganglia than any other abdominal disease. The probability that there might be an under-current of inflammatory action in the capsule, which might extend along the nerves, and ultimately implicate the semi-lunar ganglia, and which might be subject to periods of remission, would explain what Dr. Duffey had pointed out; namely, that many of the symptoms of Addison's disease were liable to remission. In connection with that view cases had been recorded in which the disease had demonstrably travelled up along some of the nerves from the supra-renal capsules to the semi-lunar ganglia, which were found in an abnormal state.

Professor Moore said that his case of bronzed skin was not simply one of supra-renal melasma. The abdominal glands generally were enlarged, and there was also some tubercular or strumous disease of the lung, but there was no disease of the supra-renal capsule. In his (Dr. Moore's) case there were all the symptoms of Addison's disease, in its more aggravated form, including dementia and complete regurgitation of everything. The urine was normal; the blood contained a slight increase of the white corpuscles; but the question was, had these white corpuscles increased absolutely, or only relatively. Dr. Bennett and others made a careful microscopical examination of the supra-renal capsule, but no one who examined them saw any sign of strumous disease about them; so that, in that case, there were all the most marked and progressive signs of Addison's disease, without any tubercular or strumous disease of the supra-renal capsule. But there was strumous disease elsewhere; namely, in the abdominal glands, and also tubercular disease of the lungs. It was said by Dr. Habershon and Dr. Wilks, that in Addison's disease, there was a specific deposit in the supra-renal capsule, and Habershon explains the vomiting that occurs as being due to reflex irritation of the pneumogastric nerve. His (Dr. Moore's) case upset that theory; there was no prominent enlargement of the supra-renal capsule, and there was no retention of food at all; the asthenia was also extreme, and, for weeks before death, the woman ceased to speak audibly. About eighteen months ago he had another remarkable case of discoloration, which differed from the first. In that case, also, there was vomiting and great asthenia, and it proved fatal. The principal *post-mortem* change was scirrhous obstruction of the bile duct. He (Professor Moore) concluded, therefore, that there could exist any amount of cutaneous discoloration in the absence of enlargement of the supra-renal-capsules, either from strumous or malignant disease.

Surgeon-Major Gore remarked that, in malaria fevers, discoloration of a brownish-yellow character, was very common, and where boils occurred, the cicatrices became quite brown, and remained so for a long time.

Dr. Finny objected to the name "supra-renal melasma." Dr. Greenhow recorded in his book nearly twenty cases in which bronzing of the skin occurred without any pathological changes in the supra-renal bodies. From the proximity and sympathy between the supra-renal bodies and the semi-lunar ganglia, it was quite sufficient to consider the disease as due to sympathetic alterations, without binding themselves to include affection of the supra-renal bodies as part of the cause.

Dr. Duffey was glad he had brought the case forward, although it was as yet incomplete, as it opened up the whole subject of abnormal pigmentation, about which, he believed, very little was known. Dr. Nixon had correctly stated Jaccoud's theory as to the pathogeny of Addison's disease

namely, that it was due to an irritation which had its point of departure from the supra-renal glands, the centre of radiation being the semi-lunar ganglia and the pigmentary hyperæmia being the result of the abnormal development of function. His views were corroborated by the lowering of temperature which had occurred in several cases. Professor Moore's case, with the exception of the extreme blackness of the discoloration, was by no means unique. Jaccoud has collected seventeen cases of discoloration of the skin, without any lesions of the supra-renal capsule, and Dr. Greenhow a larger number, twenty-one, not including Professor Moore's cases, which, however, he believes to have been of an analogous nature.

The Society then adjourned.

SURGICAL SOCIETY OF IRELAND.

THE Sixth Meeting of the Session was held on Friday evening, February 16th, the President of the College, Dr. G. H. KIDD, in the Chair.

Dr. HENRY TWEEDY read a paper on

TETANUS,

which will be found on page 100.

Dr. ROBERT M'DONNELL (Vice-President of the College) then gave

THE PATHOLOGY OF THE CASES.

The members present know as well as I that some difference of opinion exists as to the pathological changes found in the spinal cord of patients who die of tetanus. This will not be wondered at by those who know the difficulty of making good microscopic sections of the nervous centres. Of the cases of tetanus just detailed by Dr. Tweedy, the cords of those which terminated fatally were examined by Dr. Bookey and myself. The sections here exhibited were made by the aid of Dr. Bookey's freezing microtome, from segments of the cord kept nearly two months in Müller's fluid. They have been stained by carmine, cleared with clove oil, and mounted in Damar solution. There are also some slides showing the cells and other structural elements of the cord stained with blue and with carmine, made previous to immersion in Müller's fluid and mounted in glycerine gum. I may describe in very few words the state of the cord as we found it in these instances: When quite fresh they both showed great vascularity; the grey or central part especially was of a bright pinkish red colour. The sections exhibited show that the vessels were much dilated—to two or three times their normal dimensions. Having shrank from the action of the Müller's fluid they seem to have spaces around them; these, however, are not areas of disintegration, but simply the perivascular spaces around vessels which had been much dilated. The cells of the anterior horn are large and well developed, more so than in most healthy cords. Frommann, Charcot, and others have observed these multipolar nerve-cells of the anterior horn sometimes attaining colossal dimensions in subacute myelitis. The specimens under the microscope show that if not colossal these cells in these instances were of more than ordinary size. We did not observe that the axis cylinders of the nerve fibres were tumefied. Around the central canal, and especially the posterior commissure, the most marked changes are to be seen. There is, in fact, a myelitis with proliferation of nuclear elements choking up the central canal and to some extent infiltrating the grey commissure. This is most marked in the section of the lumbar enlargement. The appearances altogether are in accord with the account given by Michaud; we have not found any distinct areas of disintegration, such as Lockhart Clarke and Dickinson describe. In our cases the changes are certainly such as would escape any but a careful microscopic examination. They are, however, definite enough, and all point to increased vascularity or slight subacute inflammation of the cord. The great size of the vessels, the well-developed condition of the multipolar cells of the anterior horn, the proliferation of the cells of the neuralgia, the condition of the central canal and grey commissure, are all the natural consequence of hyperæmia, which was obvious enough to the naked eye in the fresh sections. None of the changes observed seem to indicate the existence of organic changes so extensive as to preclude the possibility of recovery. Exhibited in the microscopes upon the table are four preparations from the fatal cases detailed by Dr. Tweedy:—

1. Flynn—Group of multipolar cells from the anterior horn of grey matter of the cord—stained blue.
2. Douglass—Large multipolar also from anterior horn—more highly magnified, showing nucleus and nucleolus.
3. Section of the cervical enlargement.
4. Section of the lumbar enlargement.

Dr. HENRY KENNEDY desired to bring under the notice of the Society the fact that a physician of this city, the late Dr. Reid, published a volume some sixty years ago, in which he held that inflammation of the cord and its membranes was the cause of tetanus. That writer's investigations had not been followed out at all as minutely as was done at present, or as Dr. M'Donnell had described this evening; but Dr. Reid's idea was, that inflammatory action was at the root of the disease. He (Dr. Kennedy) must say, however, that that idea seemed very questionable, or at least constituted but a part of the causation of tetanus, and, in confirmation of that, he would remind the meeting that in a well-known disease that prevailed much a few years ago—he meant spinal arachnitis—all the effects of inflammatory action, both acute and chronic, were present, and yet the symptoms, as was well known, were not those of tetanus or anything like it. That consideration alone would make him conclude that inflammation of any kind could have little, if anything, to say to the etiology of tetanus. On another point he would like to make an observation. He did not hear any allusion made in the detail of the cases given by Dr. Tweedy to what used to be known as the preventive treatment of tetanus. He supposed it had gone out of fashion, and yet it came down to them with a weight of evidence and experience which it was not easy to resist, and was, as some present might remember, introduced to the notice of the profession by the late Mr. Peile, than whom there was no more able surgeon. In conclusion, he desired to allude to a case of tetanus which was admitted into the Cork Hospital several years since. A man had cut the back of his head by falling on ice, and as early as the third day symptoms of the disease showed themselves and progressed with a fearful rapidity. In that case the late Surgeon Trant used ether, which, however, had no effect on the disease, but it mitigated the sufferings of the poor patient, and he asked for it again and again.

Mr. RAWDON MACNAMARA said that cases of this kind were beyond doubt of absorbing interest. They could be regarded from two points of view; first, as to their treatment; and, secondly, as to their pathological appearances after death. He believed the most important was the treatment, and Dr. Kennedy had alluded to the pills which had received the name of Peile's anti-tetanic pills. He (Mr. Macnamara) had had some experience of those pills. A short time ago he was sent for to see a case very similar to one of those that had been described by Dr. Tweedy, in which the whole of the sole of the foot had been torn away by machinery. A couple of days after the accident it was received into hospital, one of those formidable symptoms—that of yawning—came on, and he had the greatest dread as to the result that would ensue. Symptoms quite sufficient to alarm any practical surgeon had developed themselves, and he took precautions accordingly, and adopted the very plan that had been suggested by Dr. Kennedy, and with a result that probably might be described as being *post hoc propter hoc*, and ultimately the grave symptoms gradually disappeared, and the patient went on from a state of what he believed at the time to be imminent tetanus, to that of sloughing. The patient was now recovering. He believed that Mr. Peile thought that visceral derangement tended towards the production of tetanus. Dr. Tweedy, in his paper, stated that the disease went on for several days. It was one of those diseases which had a tendency to eliminate itself: if the patients lived eighteen or nineteen days in tetanus they rarely died. All the cases of tetanus that it had ever been his lot to witness died at an early period. In a case that recovered—alluded to in Dr. Tweedy's paper—it was a protracted case. It was not, however, one of those cases which he would call chronic tetanus, but it was a case in which the patient, by very proper treatment, was kept alive absolutely beyond the number of days before which it was likely he would die. Many years ago he was present at a discussion on tetanus, and he ventured to express an opinion which had been supported by every case that he had known of, and that was that the most successful treatment was the belladonna. As far as he knew the treatment by belladonna had turned out more successful than the other modes of treat-

ment. He was now alluding to the treatment of these cases, and not the pathology. Brown-Séquard, too, was satisfied that the belladonna treatment would be attended with the best results. As far as he (Mr. Macnamara) had gone, in the inception of a threatened attack of tetanus, he believed that the anti-tetanic pills of the late Mr. Peile were the best plan of treatment that could be adopted.

Dr. MAPOTHER thought it would be interesting if Dr. Tweedy would append to his reports of the cases the physiological effects that were produced by the Calabar bean. It was important to know whether this medicine, administered in the quantities that had been stated, had any physiological action; and if so, whether or not in the direction of diminishing the pathological conditions which were known to exist in tetanus.

Mr. TYRRELL could not understand what effect Dr. Peile's pills could have on tetanus. Yawning was generally considered by old women as a good sign. As to the amount of information thrown upon the pathology of the disease and its treatment, and that those who lived for a certain number of days the chance was that they were getting better, he thought it was pretty well known that in acute cases the patient generally died about the fifth day, and if he lived longer, he might recover—at least he had a chance. The paper of Dr. Tweedy, and Dr. M'Donnell's supplement to it, resolved itself into two heads, one of which was—the principal point for consideration—namely, the pathological appearances presented in the cord in these cases. That was a subject of investigation that should be worked out, for, as far as they knew, no single mode of treatment had been efficacious, or rather every variety of treatment had been efficacious. Belladonna had its advocates, and a few years ago this city was all alive to the treatment by nicotine. Dr. Haughton made some experiments, and then it was found that nicotine was a panacea for the disease. He (Mr. Tyrrell) was an enthusiast in those days, and, fortunately, two cases under his treatment recovered under the local application of tobacco to the wounds. Two other cases, however, died. Afterwards some cases recovered by the use of chloroform, and one very remarkable case recovered by that treatment. Then, after an interval, two other cases occurred in the Mater Misericordiæ Hospital, under the care of Dr. Hayes, at a time when the Calabar bean was in vogue, and that treatment signally failed. Another case occurred in which they gave nothing but nourishment, and it recovered; so that patients recovered from the disease under all varieties of treatment. As far as the therapeutics of the disease went, he did not think they were far in advance of what those who had gone before them knew; but regarding what Dr. M'Donnell had spoken of, where they were likely to arrive at something tangible, it was of great importance that these recent observations should be recorded, so that they might see whether the next cases that occurred would show corresponding changes in the cord. If such cases showed that the changes occurring in the cord were always the same, then they might possibly be in a position to derive some advantage, and possibly arrive at some means of treating this most formidable disease. It was a disease that had eluded the researches of the greatest therapeutists, and seemed at present to be amenable to all varieties of treatment, and perhaps amenable to none.

Mr. TUFNELL said, it sometimes happened that more cases than were ordinarily met with of a special disease came under one individual surgeon's observation, and so it happened that in the City of Dublin Hospital he had had an unusual number of cases of tetanus. In the twenty-seven years that he had been connected with that hospital he had placed those cases under treatment by chloroform, hydrate of chloral, nicotine, belladonna, calomel, and opium. He had discarded belladonna and nicotine. The two remedies he now relied upon were chloroform and hydrate of chloral, with support of the powers of life from the commencement. He had also used Peile's pills in cases where he anticipated an attack of tetanus. He had used chloroform to an immense extent in one case, which he brought before the Society some years ago. He had the patient kept eight days and seven nights under the influence of chloroform. It was used with the late Dr. Hardy's douche. The case was one where a hook entered between the ring-finger and the little finger, and transfixed the hand. It was a case of acute tetanus, and came on the fifth or sixth day, the patient being brought into hospital in a state of tetanus. He was allowed to come from under the influence of the vapour every third hour; the gag was taken out of his mouth, and about a dessert-spoonful of essence of meat introduced, and then the patient was douched off again. That patient recovered. The concentrated essence of beef was made thus: a pound of beef, half a chicken, and a pound of veal were all chopped up together, and put into a jam-pot without any water and boiled for four hours. A dessertspoonful of that, with a little salt, was put into the patient's mouth about every third hour, giving also injection by the rectum, provided so doing did not bring on the spasm. If it did, then they must trust entirely to the mouth.

Dr. KELLY said, with regard to the epidemic tendency of tetanus, some years ago some cases having fallen under his observation, he brought the subject-matter of them before the Society. At that time they happened to have a rather severe epidemic of scarlatina, and at the same time the weather—as, unfortunately, frequently occurs in this climate—was very variable. These things, together with the occurrence of two cases in Jervis Street Hospital, and some in other hospitals—in all some six or eight cases, at the same time—drew my attention to the epidemic tendency of tetanus. With regard to the bearing of these cases on the present, he might remind the Society that the last few months have been peculiar in the variability of the temperature. Together with that, they had had an invasion of acute scarlatina, and also they had been threatened by another epidemic in the form of small-pox. Since Christmas four cases of tetanus in horses had fallen under his observation; of those cases three recovered and one was fatal. He anticipated that some report would follow as to the occurrence of such cases in the human subject. However, he was disappointed until about three weeks ago, when a case occurred unfortunately in his practice—a case of Syme's amputation of the foot was followed by chronic tetanus. He might mention that it occurred about the twenty-first day, and there was well-marked chronic tetanus and rigidity of the muscles of the neck, and particularly of the muscles of the abdomen. However, the patient, without having any special treatment resorted to, completely recovered from the symptoms of tetanus. The patient, he might mention, did not present that symptom of yawning which he thought was very frequent in these cases. Being asked over and over again for an explanation of that occurrence, he might say that, as far he could judge, it appeared to be a means of resting the jaws after spasmodic contraction which had occurred for several days, and it naturally extended the muscles. In that way he thought they could account for the presence of yawning, which was a symptom he had seen almost invariably in these cases. With regard to the utility of purgation, he might mention that in a case that came under his notice last month, diarrhœa occurred from time to time irregularly, so that that could be taken as corroboration of one view or other as regarded the benefit of the treatment by Peile's pills. He had not heard of any other case of tetanus occurring in a Dublin hospital within the past few months; but it was an interesting fact to have occurring four cases among horses and one at least in the human subject. He might mention that in all the cases of the horses hydrate of chloral was used very extensively.

Dr. B. F. M'DOWELL said, he had at present a case of tetanus in Mercer's Hospital which seemed to bear out the view of the disease being epidemic—if they could look on it as such. That case was under treatment by belladonna, and the patient, who was in his seventeenth day, was progressing favourably.

Dr. F. T. PORTER said with regard to the question of epidemic tetanus they ought not to lose sight of the fact that in many cases, especially in nervous females, hysteria so strongly simulates tetanus that it often creates a great difficulty to come to a right conclusion with regard to the nature of the disease. As to the treatment, he might mention that he had witnessed Dr. Haughton's treatment by nicotin in two or three cases, but it did not succeed, though the patients obtained a good deal of relief for the time. It was given in the form of injections; the tobacco was not applied locally to the legs, as in Professor Tyrrell's cases. He (Dr. Porter) would like to know Dr. Tweedy's opinion as to the benefit obtained from the use of the spinal ice bag in cases of tetanus, and whether he had had the same success as with the nitrit of amyl. He (Dr. Porter) did not think the character of a tetanic spasm was sufficiently marked in many cases, and he thought that there ought to be a note taken in each case of the detailed character of each spasm, and the muscles affected. He thought that would be a key to the exact portion of the spinal cord affected, because he did not believe that in all cases of tetanus the spinal cord is necessarily very extensively affected.

Mr. STOKES said that regarding the remarkable symptom

of yawning, he thought it a very usual one in tetanus. He had observed it in a great number of cases, and he must refer to what was said in reference to the same point by his friend Dr. Kelly in the observations he made as to the explanation of yawning. In that he could not agree with Dr. Kelly, for he had observed that the remarkable symptom of yawning took place considerably anterior to the period of the spasm. It was one of the earliest symptoms they noticed which made them dread very much the subsequent occurrence of spasms. His experience was that when the symptoms of tetanus were well marked, then yawning was not so frequently observed. What they should do in reference to prognosis in looking at the spasms was—they should bear in mind what the late Professor Smith used to say, and put great stress on, in his lectures in reference to the prognosis of the ultimate result of a case; he used to say that it was much more important to observe the length of time that existed between the spasms, than the length of time the case lasted; that if they observed the length of time shortening between each spasm the prognosis would be unfavourable. That, he (Mr. Stokes) thought, was very important to bear in mind in studying the clinical history of these cases. In reference to treatment, the plan he had found to answer best was the treatment by belladonna and mercury, and it was interesting to observe that the only case in the valuable series that had been brought under the Society's notice by Dr. Tweedy—the only case in which a recovery took place was the one in which that line of treatment was adopted. The great practical result of Dr. McDonnell's interesting microscopic investigations appeared to him (Mr. Stokes) to be that there was an inflammatory element observed in the pathology of these cases. If that was borne out by future similar investigations, he thought it would be of great interest and importance, and would enable them to arrive at more definite conclusions as to what should be the proper treatment to adopt in this disease.

The VICE-PRESIDENT (Dr. Robert M'Donnell) concurred in the truth of Mr. Macnamara's remarks that the later the symptoms come out, the better chance there was of the patient's recovery. With regard to the pathology of the disease, he (the Vice-President) thought their great object in investigating a subject of this kind very closely was, that it was only by a very careful and very accurate pathological investigation that they could ever get a basis for a rational treatment, as distinguished from an empirical treatment. He did not say empirical in an offensive sense, having regard to the great discoveries made in this way; but he thought that in the present day they might attempt more to follow the example of the highly skilled physician or surgeon who tries to hunt down disease. The one method of treatment was based on an intelligent effort to get on the true scent, while the other, even if very often successful, was at best a conjecture. By a careful study of the pathological changes, they got on the right track in regard to investigating the rational mode of treatment as distinct from the empirical. He thought the microscopic specimens of sections of the cord had a high value. He did not mean to say that the method of freezing was new to histologists, but it was new to some of those present. He did not claim any originality for those specimens, he merely said they were upon the whole in harmony with observations made by other observers in the same direction. They knew that Rokitansky, though not admitting very considerable changes in the cord, admitted that there were proliferating tissues in the central part, and even Billroth, the skilled specialist, who examined cords for him, found similar changes to those he (Dr. M'Donnell) had brought forward. Lockhart Clarke and Dickinson went even further, and showed even greater changes in the cords than he had found. Mr. Stokes had alluded to the treatment by mercurials and belladonna, and he (Dr. M'Donnell) thought they appeared to be the most rational line of treatment to be followed. He did not know that they could find any remedy which would be always successful in so terrible a disease; all that they could aim at was a method of treatment which would be on the whole indicated by the condition of things to which the pathology led them. He had heard the treatment by nicotine spoken of as Professor Haughton's treatment; but many of the members present knew that before Professor Haughton came to the profession, the treatment by tobacco was in fact a favourite hobby of Mr. O'Beirne's, of the Richmond Hospital, who had pushed it to the extremest limits. With regard to treating the symptoms, Mr. Tufnell had spoken of the advantage of the use of chloral and chloroform; and no person who was anxious to leave no stone unturned in saving his patient's life, should neglect the treatment of the symptoms, but that must be looked upon as something different from a treatment aimed at the root of the disease. They knew that the timely administration of chloroform might save a patient, by subduing a spasm, and enabling nourishment to be administered at the right time. In a case at Jervis Street Hospital, he (Dr. M'Donnell) had adopted transfusion with the view of prolonging life, where it was impossible to administer nutriment either by the mouth or rectum.

Dr. TWEEDY, in reply, said in answer to Mr. Porter's question, that ice was used in two of the cases, but as so many remedies were tried in each, that it would be very difficult to say from which of them, or whether from any of them, the patient recovered. It seemed to him (Dr. Tweedy) that the only way to put the rational curative treatment of tetanus on a firm basis would be to have the pathology of it set at rest at once and for ever, and then the empirical treatment might come to a conclusion. Of course they should endeavour to keep up the patient's strength as much as possible, but it is often very difficult to do that, from the fact that they were unable to take any food, in consequence of the lock-jaw, and if it was given by enemata it would be rejected. With regard to what Dr. Kelly had said about yawning, in addition to the fact that yawning came on as a premonitory sign, and not following a spasm, would it not seem also to be the case that yawning was in itself a contraction of the muscles, and not a a relaxation of them, as Dr. Kelly seemed to imply—not merely to rest the jaws, but it was premonitory in that sense as well—it was a contraction of the muscles showing the greater contraction which afterwards did come on. With regard to what Mr. Stokes had said about Mr. Smith's lectures, he (Dr. Tweedy) remembered Professor Smith's observations on the subject, and he said that great importance was to be attached to the length of time that existed between each spasm—far more than to the prolongation of the disease, but he also stated, to the best of his (Dr. Tweedy's) recollection, that no case could be considered perfectly free from danger until after the thirtieth day, no matter how long the patient might be free from spasm.

The Society then adjourned.

Medico-Parliamentary.

THE REGISTRAR-GENERAL'S STATISTICS ON VACCINATION.

A QUESTION having been put on Thursday in the House of Commons relative to the absence of information in the Registrar-General's returns, Mr. Sclater-Booth stated that the reason why 13,424 cases of small-pox were not recognised in the 35th annual report of the Registrar-General as not vaccinated or vaccinated arose from the fact that the legislature did not give him any means for insisting on the information being provided in the medical certificates.

THE SANITARY STATE OF THE WAR OFFICE.

ON Thursday the Chancellor of the Exchequer, in reply to Mr. Coope, whether, after the adverse report of the committee appointed to investigate into the sanitary state of the War Office, the Government were taking any, and, if so, what steps for the erection of a new office suitable to the wants of the department, said that what was being done was in compliance with the recommendations contained in the report of the committee, and the works would be immediately commenced. The Government was seriously considering what steps should be taken with regard to the erection of new offices for the department.

THE LIMEHOUSE SMALL-POX HOSPITALS.

ON Friday Mr. Sclater-Booth, in reply to Mr. Ritchie, said he was informed that the Fulham Small-pox Hospital was now open for the reception of patients, and that at Deptford would be ready in a few days, when no further patients would be sent to the Limehouse Small-pox Hospital.

LOANS FOR SANITARY PURPOSES.

ON Friday Mr. Sclater-Booth, in reply to Mr. Whitbread, stated that the last published returns of loans to

urban sanitary authorities showed that the sanction of the Local Government Board had been given to loans amounting to £1,835,797 to urban sanitary authorities. Since that time, although the accounts were not completed for the year 1876, sanction had been given to the urban authorities for the borrowing of £2,506,459, showing an increase of £670,662. In the case of the rural sanitary authorities the amount, by the last returns, was £137,808, and during the year 1876, £200,692, showing an increase of £62,284.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, MARCH 14, 1877.

SALICYLIC ACID IN ACUTE RHEUMATISM.

IN the *Boston Medical and Surgical Journal* for Feb. will be found an analysis of 109 cases of acute rheumatism, treated with salicylic acid and salicine, chiefly the acid; while in the last two issues of THE MEDICAL PRESS there is a brief account of twelve cases of rheumatism treated with the same remedy. The opinion of the profession, respecting the therapeutic efficacy of salicylic acid in acute rheumatism, has already been very favourable, and it will be worth while to see how far this favourable opinion is confirmed by the results of treatment in the large number of cases under consideration.

All the American cases except three were treated with the acid at the Boston City Hospital, in the service of Drs. Borland, Blake, Curtis, Edes, Draper, Doe, Syman, and Stedman. According to the analysis recorded by Dr. C. W. Brown, the average time to relief—*i.e.*, to the hour when the symptoms were distinctly ameliorated—was 1·46 days, the extremes being three hours and four days. The average time to complete cessation of pain was 2·85 days, the extremes being twelve hours to fifteen days. The average amount of acid taken to produce relief was 154 grains, the quantity varying from 30 to 210 grains. The amount required to produce complete relief from pain, and mobility of the joints, was 531·22 grains to each patient. Deducting the three largest amounts taken—880, 940, and 2,250 grains—the average to each patient was 400·84 grains. The average time during which the acid was taken by each patient was 6·22 days, the absolute time varying from one day to thirty-one days. Excluding cases 1, 19, 26, 36, and 103, the average number of days each patient was in hospital was eighteen, varying from three to fifty-nine days. The acid produced no relief in three cases, but in two of these cases very little acid was given. Two cases died; one from pericarditis, and one from cerebral complications. Eighteen cases had one relapse, three had two, and one had five while in the hospital. Nausea and vomiting were noted in twenty cases, or in 18·8 per cent. Moreover, the universal result of the acid, when given in full doses, was to cause a fall of temperature. The effect on the pulse and respiration was less marked, as they usually fell less rapidly.

With regard to heart complication, it is stated that in thirty-eight of sixty-three cases observed, which were treated with salicylic acid, the heart was normal throughout. In twenty-four the heart was affected on entrance, and in three after entrance; assuming, says Dr. Wood, that the heart was normal in a very large proportion of the cases in which its condition was not recorded. But upon the basis of the sixty-three cases, the heart became affected after entrance in only 4·76 per cent.; while under the alkaline treatment, in the series of cases reported by Dr. J. G. Blake, 13 per cent. developed heart affection after entrance.

The patients were usually placed upon treatment by the house physician soon after entrance, the common dose being ten grains every hour while awake for twelve to thirty-six hours, when the symptoms were wholly or partially relieved. Afterwards the acid was either omitted altogether, or reduced to ten grains every two or three hours for a time, to be again reduced, and finally omitted in from ten days upward. Usually no opiates were given, and no attention was paid to the condition of the bowels.

Such are the chief facts mentioned by Dr. Brown, in his analytical statement, and they certainly put the salicylic acid treatment in a favourable light. But accompanying his excellent paper is a tabulated account of each patient, specifying the kind of attack, length of illness previous to admission, number of days in hospital, &c., and in carefully running our eye over these tables, we come upon certain facts which, judging from the result of treatment in these 106 cases, make us hesitate before joining in the acclamations with which this remedy has been received by the profession.

For instance, the length of time a large majority of the patients were in hospital would appear to belie the supposed efficacy of the drug, and to be at variance with the speedy relief which at first follows its administration. In no fewer than half the cases the patients were in the hospital from three to six weeks, the majority of those being from four to five weeks. And if we take into consideration that all the patients had been ill previously to their admission into the hospital, for a period varying from seven to fourteen days, or longer, the whole duration of the disease in the above cases is little short of that recorded

under other systems of treatment. It would seem, indeed, that the salicylic acid gives speedy relief to the more acute symptoms, abating the pain and lowering the temperature, but otherwise it does not appear, as far as these cases show, to materially shorten the attack, or hasten convalescence. It is, moreover, very difficult, as the effects of medicines are at present tested, to know, as respects the favourable terminations, how much is due to nature, and how much to the drug. The duration of acute rheumatism is very various. "In some cases," says Aitkin, writing long before this treatment came into fashion, "both the fever and local pains are gone in three or four days, but in the majority of instances they continue till about the tenth to the fourteenth days, when the fever disappears, the pain begins to subside, and towards the close of the third or fourth week the patient is recovered, and generally without injury to the joints affected." Dr. Fuller's observations led him to believe that the average duration of an uncomplicated attack may be reduced by judicious treatment from a month or five weeks to ten days or a fortnight, and his opinion is quite consistent with the experience of other eminent authorities we might mention. Even the rapid relief attending the administration of salicylic acid has its counterpart in that frequently obtained under the alkaline treatment. Under this treatment, patients often lose their pains, and proceed rapidly to convalescence. In twenty-three out of thirty-nine cases treated by Dr. Fuller, "the pulse was tranquillised within forty-eight hours from the commencement of treatment, and within twenty-eight hours the pain was lulled and the local inflammation subdued."

Considering, however, the liability of patients suffering from acute rheumatism to so serious a complication as that of heart disease, most credit should be given to the remedy which wards off that complication, rather than to the remedy which merely shortens the duration of the attack. The safety of the heart should be, in our opinion, the first consideration in the treatment of acute rheumatism, and the attainment of this object should be made the great test of the efficacy of one plan of treatment over another. The treatment which has hitherto been most efficient in warding off the cardiac complications is that by alkalies in large doses. We are not aware that this success was so great as that recorded in sixty-three of these cases, in only 4·76 per cent. of which the heart is said to have been affected after admission; and if future experience confirms this important prophylactic property of salicylic acid, we shall then confess we have found a more valuable remedy for acute rheumatism than any hitherto discovered.

We have not yet referred to the series of cases of acute rheumatism treated by salicylic acid, recently reported in our columns by Mr. S. Scriven. These cases were admitted into St. Mary's Hospital under the care of Dr. Handfield Jones and Dr. Cheadle, and in most respects the result of the treatment adopted coincided with those recorded by the American physicians. The average time the patients were under treatment was a little over three weeks, the shortest period being fourteen and the longest fifty-two days. The temperature was soon reduced, and the pain diminished by the acid. The heart also was but little affected, and in only two cases was there a temporary murmur to be heard. Moreover, in these cases, as well as in the American cases, nausea and sickness were often caused by the acid, and in some instances to such an extent that the acid had to be withheld altogether.

The deductions drawn from those twelve cases by Drs. Handfield Jones and Cheadle and Mr. Scriven correspond with the opinion which we have just given as to the merits of this new remedy. "Salicylic acid," they say, "though not a specific, is a most valuable remedy in rheumatic fever." It also, in their opinion, "probably lessens the tendency to pericarditis and endocarditis." With regard to the mode of administering the acid, the above physicians give it in water combined with an equal quantity of carbonate of soda and a little tinct. aurantii. In the Boston Hospital the acid was first taken in wafers, but soon afterwards it was given in pills made with honey or molasses, and containing 3½ grains each. In both these series of cases the acid was in the majority of instances only used for a few days, and in the opinion of Dr. Handfield Jones it is best to leave off the remedy as soon as defervescence takes place, and if needful to give it again on a return of the pains or high temperature.

APPROPRIATION OF FINES IN MEDICAL PROSECUTIONS.

We have already spoken in deprecation of the policy which animates the Medical Council in its avoidance of responsibility for the prosecution of quacks, and we have said that, in our opinion, no duty more closely attaches to that body than the function of enforcing orthodoxy in medical matters, and that the throwing of such function upon a voluntary organisation like the Medical Defence Association is very clear proof that the great people of the Council are incapable of either coping with any duty which requires firmness, or of sympathising with the rank and file of the profession and with the public who do not come within their immediate ken.

The Council of the Irish Pharmaceutical Society, acting under the influence of Sir Dominic Corrigan, have repeated the same mistake, and have taken, thereby, their first step towards unpopularity with the constituency which they represent, and their refusal to insist upon compliance with their own law is all the less defensible, inasmuch as the English Pharmaceutical Society has shown them an example and has displayed commendable activity in the prosecution of persons acting in contravention of the law. It seems that it has done so under considerable difficulties, for we find in the editorial columns of its official organ the following statement:—

"In performing the duty imposed upon the Pharmaceutical Society by Parliament, of carrying out in the interests of the public the provisions of the Pharmacy Act, it has become necessary on various occasions to institute legal proceedings against offenders. Almost invariably when these cases have been carried to a hearing a penalty has been imposed, and this has exercised a certain amount of deterrent influence. So far, such a result has been satisfactory, but it has nearly always involved a cost to the Society far exceeding both the penalty imposed upon the offender and the costs allowed, so that the expense of such proceedings for the protection of the public have in fact been to a great extent borne by that portion of the trade which constitutes the Pharmaceutical Society. It might therefore have reasonably been assumed that the penalties recovered under the Act would be

left in the hands of the Society as partial reimbursement of its expenses in carrying out a public duty.

"Such an assumption, however, would have been unwarranted, as was evidenced by two penalties recovered in Glasgow being claimed by the Queen's Remembrancer in Scotland last October. It became necessary therefore to make a formal application to the Commissioners of Her Majesty's Treasury, who, according to the 14th section of the Act of 1852 and the 15th section of the Act of 1868 are the authorities to decide to whom the penalties shall be paid, that they would direct that the penalties should be retained by the Society. Somewhat unexpectedly this application met with a prompt refusal, accompanied by an order to pay over to Her Majesty's Receiver of Fines all penalties recovered under the Acts since they were passed. This communication was considered by the Council at its meeting in November last, when a deputation was appointed to wait upon the Commissioners of Her Majesty's Treasury with a view to obtain a more favourable decision.

"After an interval of nearly three months, an appointment was made for an interview, and the deputation laid before the Secretary to the Treasury the reasons why the Council thought the Society should be allowed to retain the penalties. It is satisfactory to find that upon reconsideration these reasons were deemed sufficient by the Treasury, and that in a letter which was read at the meeting of the Council on Wednesday last, the Commissioners of the Treasury cancel the previous order to pay into the Exchequer the fines in question."

The concession of these fines by the Treasury is a valuable precedent, and by such concession the only excuse which the Medical Council could plead for its inactivity is taken from it. Doubtless the Treasury would be as ready to forego the fines in medical as in pharmaceutical cases, and the sums thus recovered would doubtless be sufficient to cover the expenses.

THE BLOT ON THE ARMY ESTIMATES.

One year has passed since the Secretary of State for War introduced, with somewhat overbearing confidence, a scheme which, in conjunction with the unification system, was to convert the medical service into a departmental Utopia. For, while by the ten years' service proposed the very best medical material was to be drawn into the department, it was by the unification scheme to be preserved from all deteriorating contact with military officers, from the attractions of the mess-room and the wiles of the billiard-room, and being thus isolated in, our Army Medical Monastery was to grow in professional grace from day to day. Could anything have been more perfect? And yet here and there an unbeliever arose who, though admitting that monasteries were excellent institutions for those that liked them, hinted that they were not quite in harmony with the tastes of humanity in general, still less of youthful humanity; but such scepticism was met by Mr. Hardy with words of withering contempt.

A year has passed and Mr. Hardy, having to give an account of his measure of success, approaches the topic with a remark replete in bad taste and bad temper: "The subject I wish next to touch on is one which has been very troublesome ever since I have been in the office I now hold, and which I fear will continue *as long as medical men exist.*" In these pettish words the Secretary of State so far forgets his duty as a public man as to insult a whole profession because a scheme which was an obvious mistake from the beginning has failed within a year.

Angry alike with the younger medical men who declined to take up even fifty per cent. of the offered vacancies, and with the elder ones who honestly spoke their opinions from the professorial chairs, Mr. Hardy thinks to recover his retreat by implying that there is an insatiability in the medical nature which it is useless for him or any one else to attempt to gratify.

It becomes somewhat amusing, for when later on this sentence is altered, "we must see first whether the medical men will enter in sufficient numbers." With what glasses Mr. Hardy has observed the results of the last two examinations we know not, but if an unmistakable decrease from 33 to 23 candidates for fifty vacancies is not sufficient proof we know not what he requires, and cannot help thinking that the question is merely shelved to give time for his elevation by the acceptance of a peerage to that atmosphere in which "*medical men do not exist.*"

Notes on Current Topics.

Medical Society of London's Anniversary Dinner.

The Medical Society of London held its 104th Anniversary Dinner at St. James's Hall, on Thursday evening last, the President (Mr. Wm. Adams) in the chair. Many of the Fellows, both from the provinces and London, were present on this occasion, and the dinner was a great success. Among the guests who had been especially invited we noticed the President of the Royal College of Physicians, the President of the Royal Medico-Chirurgical Society, the President of the Clinical and Hunterian Societies, Dr. Belgrave Ninnis (Fleet-Surgeon, and connected with the Arctic Expedition), &c., &c. Various toasts were proposed during the evening, and were duly responded to by the representatives of the different societies and corporations.

Dr. Braidwood, of Birkenhead, was presented with the Fothergillian Medal for his excellent treatise on Pyæmia, which was not only marked for its general excellence, but contained numerous original drawings, microscopic and otherwise, of morbid specimens. Mr. Richard Davy, the retiring Hon. Secretary, received the silver medal for his services to the Society in his official capacity.

The musical arrangements were under the direction of Dr. L. S. Forbes Winslow, and were fully appreciated. Among the *artistes* who kindly lent their assistance were Herr Carl Armbruster (a wonderful performer on the piano), Herr Guthoven (who brilliantly executed two pieces on the violin), Dr. Charles Semple, and Mr. Arthur Twiss. Dr. Winslow concluded with a topical song, in which reference was made to the visit of the delegates from the Society to America, Hygeia, Cleopatra's Needle, the Vivisection Act, Vaccination, Female Doctors, the Habitual Drunkards Act, and English Physicians in France.

The company separated at eleven o'clock, having spent a most enjoyable evening. The dinner and general arrangements were admirably conducted, and appeared to give universal satisfaction.

Sham Degrees.

It is a satisfaction to us to learn (which we do from a circular issued by that gentleman "for private use only") that the "Dr." Sturman, who vends sham diplomas at Blackheath, is not even nominally a member of our profession. He is a schoolmaster, and a member of the Preceptor's College, and his doctorate consists of the LL.D. of some institution of which he does not seem proud, for he does not name it amongst the multifarious titles appended to his name.

This circular "for private use only," is enclosed within his school prospectus, and it is worth perusal as an evidence of how little gratification either the vendor himself, or any of his customers derive from the consciousness of having been honoured with a degree *in absentia* by the distinguished universities which "Dr." Sturman represents. Only one medical man—a L.R.C.P. Edin., F.P.S. Glas., and L.S.A. London—testifies to Dr. Sturman's qualities, and even he says nothing for the degrees in question. Another testimonialist assures the public that Dr. Sturman "can forward the aspirations of qualified gentlemen who desire to obtain learned degrees," and others sing the same tune, but not one of them ventures even to attach their own titles to their names. By all means let Dr. Sturman continue to provide dissenting curates and schoolmasters with all the university titles they long for. The gratification of their vanity does no one the least harm, and the sham titles are, doubtless, seen through at once by everyone whose opinion is worth anything. It is a different matter with medical practitioners to whom a sham degree affords an opportunity for quackery, and we therefore commend Dr. Sturman's customers to the tender mercies of the Medical Defence Association. As for the distinguished Doctor of Laws himself, we suggest to him that his field of educational labour is more directly connected with the birching of little boys, than with the capping of university graduates, and we imagine he will find the less aspiring employment the more remunerative.

Unqualified Assistants.

A good deal has been written upon this subject lately, both in our columns and in those of our contemporaries, and as attention has been drawn to various phases of illegal practice by correspondents, of the extent and nature of which we and, probably, the majority of the profession, were before unaware, we would fain hope that a considerable amount of good will result from the discussion. An extraordinary instance of illegal personation came under our notice within the last few days, and were the gentleman now living, we should have felt it our duty to give names; this, however, is not necessary, as he has recently passed away from our midst, and with him we are willing to bury his sins. The publication of the case, however, may not be unnecessary, as illustrative of the practice which we desire unreservedly to condemn, as subversive of the best interests of the profession, and a fraud upon the public confidence. The gentleman concerned was for many years a consulting surgeon in London, enjoying a large practice. Not unfrequently he found himself suffering from certain internal complications, which precluded the opportunity of seeing patients; when this was the case, instead of calling in a professional *confrère*, he invariably sent for his chemist, who not only prescribed for him, but even saw his patients, as though he were the real Mr. ——. Later on he was absent for some weeks through illness, his friend, the chemist, all along doing duty for him, and handing over his fees. After this long abstention, albeit a part of the time he was being nursed, free of expense, at the chemist's country house; he hit upon the wise and grateful policy of cutting his "friend-in-need," lest he should know too much for his peace of mind, and sent his patients to another shop for their medicines. It will, doubtless, be asked why an eminent consulting surgeon should have resorted to such practices. The reply is simple enough, although discreditable in the extreme. He had a lucrative *clientele*, and had not sufficient confidence in his own abilities that he could retain it if a professional brother were introduced, nor sufficient confidence in a member of his own profession that he would not employ the opportunity thus afforded him of drawing patients into his own consulting room. The chemist he knew dare not do this, and so he connived at a base fraud, and pocketed his conscience with the fees. Although for reasons before stated, we abstain from giving names, our readers may be perfectly sure of the accuracy of our information, which, had it reached us before, instead of after, Christmas, we should have felt bound to disclose.

More Verdicts by Guesswork.

The Irish coroners' system seems to be passing insensibly into an organisation for the concealment of crime, and since the police have taken the initiative upon themselves in the investigation of causes of death, the holding of inquests in some localities is becoming more and more farcical. The week before last the coroner for Westmeath held an inquest on the body of a soldier, who died that morning under the following circumstances:—

At six o'clock in the morning he was apparently in good health; at eight o'clock was very poorly, and went to the hospital.

The hospital sergeant deposed that the deceased came to the hospital about nine o'clock; he was very sick; he appeared weak from having his stomach upset; there was a strong smell of spirits from what deceased had retched; gave deceased a soothing draught to settle his stomach, and told him the doctor would be back in half-an-hour; deceased then went to his barrack-room of his own accord. In about a quarter of an hour he was dead.

The surgeon, with this evidence before him, undertook to state that the man died of heart disease, without a *post-mortem* examination or the least shadow of reason, as far as the reported evidence goes, to sustain such a conclusion, and, of course, the jury found a verdict as they were directed.

We may be of a suspicious temperament, but we feel that a death after three hours' illness and vomiting is much more like poisoning than heart disease, and we know of no form of heart disease which would answer to the symptoms deposed to. We don't pretend to be able to form a reliable opinion upon such data, but we can at least give as good a guess as the doctor and coroner, who took an external view of the dead man. If the case had been one of poisoning would it not be obvious that a false

verdict would operate as a protection to the perpetrator of a crime? And would it not be better that no inquest were held at all than a sham investigation of this sort.

The Livingstone Sham University.

This fraudulent concern, supposed to be located at Haddonfield, New Jersey, is shown up in a local paper recently. There is no such institution there, and never was; yet somebody sells diplomas and degrees from it, both in Canada and England. It is believed that the great American diploma vendor, of Philadelphia, is at the bottom of it.

The Treatment of Acne with Sand.

Dr. Ellinger (*Weiner Med. Wochenschrift*, No. 45), strongly recommends frictions of the skin with fine sand in the treatment of comedo and acne of the face in young persons. The sand should be regular in grain, not dusty, and not containing lumps; particles half as large or as large as a poppy seed should alone be used. Before the friction the skin must be thoroughly washed with soap and water. It is then to be kept damp for half-an-hour, and finally the affected parts are to be rubbed for a short time with the sand, which is to be used slightly wet. Afterwards any adhering sand must be sponged or brushed away. The same method is applicable to certain cases of psoriasis, eczema, lichen, acne rosacea, and freckles. If the eruption be situated on the trunk or limbs, each friction must be preceded by the prolonged use of a moist compress to the part, so as to soften the skin.

A Case of Hermaphrodism.

Dr. Ceccherelli, in the medical review of Florence *Lo Sperimentale*, gives a description of a case of hermaphrodism, which he has examined recently, and which resembles those reported by Virchow, Rokitansky, and Seulz.

The Florentine monster is fourteen years of age; her (his) mammæ are well developed and hang down; the right eye is larger than the left; the penis, with its hypospadean meatus, can receive a sound, which, about two centimetres from the meatus, meets with another aperture, through which the urine and spermatic fluid escape. She (he) is provided with one single testicle, which is well developed.

Until within the last few years this individual had been considered a female, and named Catalina, the glans penis having been taken for the clitoris. Introducing the finger between the two labia, below the glans, an eminence is found which possesses all the characteristics of the uterine neck. The female organs of generation are complete; she has menstruated regularly since her twelfth year, and has performed the copulative functions of the female, without any obstacles or difficulties. The prostate cannot be reached, on account of the presence of the uterus.

The seminal vesicles undoubtedly exist; the sperm, examined by Virchow, presenting spermatozoids, so that Catalina may, in her turn, be the active agent of coitus.

An Improved Barometer.

At a meeting of the Physical Society, Professor Guthrie exhibited an arrangement by which the sensitiveness of the mercurial barometer is enormously increased. The two vertical limbs of an ordinary syphon barometer are united by means of a long horizontal tube of uniform bore, having a diameter considerably less than that of the main tubes. The instrument is filled in the same manner as the ordinary syphon barometer, except that a bubble of air or liquid is left in the narrow tube. The length through which the bubble moves will be in inverse proportion to the cross areas of the horizontal and vertical tubes, so that each inch of rise and fall may be shown through any number of inches by diminishing the cross area of the horizontal tube. A moment's consideration will show that, for a given increase of pressure, the absolute amount of mercury which passes from the shorter to the longer tube depends upon their cross area, and as this is greater in comparison to that of the tube uniting them, the range of motion of the bubble will be considerable in comparison with that of the summit of the mercurial column. In the instrument exhibited, the horizontal tube was bent into a spiral, in order that the vertical tubes might be in close proximity. The diameters of the tubes were six and two millimetres respectively. A complete account of this instrument will be found in the *Philosophical Magazine* for the present month.

Medical Examinations for the Public Services.

A contemporary understands that "a Bill will be presented to the House of Commons during the present Session, at the suggestion of Sir Dominic Corrigan, which will aim at the institution of examinations for the medical offices of the Civil Service (Poor-law and Public Health), comparable to the existing entrance-examinations for the Army and Navy." We have heard nothing of the coming measure, and assume that, if introduced at all, it can only be as a test of parliamentary feeling and not with any hope of its passing. So far as the foregoing announcement enables us to judge of the nature of the measure, it would seem to promise the enunciation of a good principle, and to aim at a most desirable object. As far as Ireland is concerned, nothing can be much worse than the present method of selection of Poor-law medical officers. That it shall remain so is inevitable, so long as the choice lies with Poor-law guardians, and we have little hope that Parliament will listen for a moment to any proposal to wrest the elective function from them.

A Second Alexis St. Martin.

In one of the early volumes of the Transactions of the Royal Irish Academy, there is an account given by George Burrows, M.D., M.R.I.A., of the case of a man who resided for some years in Dublin, who had a fistulous opening in his stomach, to whose case attention is called by the *Dublin Builder*. The man was previously an inferior officer in the East India Company's navy, and during a voyage he received a wound from a blunt-pointed wooden instrument between the cartilage of the eighth rib on the right side, and the navel, penetrating the

stomach. An opening remained, through which when the tent was withdrawn a whitish fluid flowed out. The man ever afterwards kept the orifice plugged up, never withdrawing the plug but to gratify curiosity, or place a new one. The opening was about a third of an inch in diameter. This rather strange patient was, when Dr. Burrows saw him, 65 years of age, and he had lived for twenty-seven years previously in the state described. He is described of extremely dissipated and drunken habits, and when sober employed his time in teaching French in Dublin. Although he had lost all his teeth with the scurvy he eat with good appetite and digestion. He had no pain, and no food disagreed with him. Having suffered a good deal of poverty through intemperance, he became reduced in circumstances, gradually declined and died. In examining his body after his death, the wound was found to have penetrated his stomach in the centre of the greater curvature, and from the adhesion of the liver, colon and integuments, a large structure was formed, which gave the appearance of a double bag, with the opening in the middle. The duodenum was enlarged beyond the size of the colon, and seemed to have performed some of the functions of a second stomach. The colon was firmly attached to the stomach by a ligamentous substance. All the other viscera were sound and natural.

George Burrows, M.D., the chronicler of this case, was the son of a respectable citizen of the medical profession. He was the author of several papers in the early Transactions of the Royal Irish Academy. His life was cut short by putrid fever in 1793, caught in dissecting a subject in the House of Industry in Dublin, to which he was physician.

Undeserved Censure on a Parochial Medical Officer.

We would like to see those stern moralists and sticklers for duty—the judges who so greedily seize the smallest fringe of evidence in order to censure medical men, and go beyond their province to read them nice sounding lectures on inhumanity—made to occupy for a short time the position of a parochial medical officer, visiting and dispensing medicines to thousands of poor at all times and seasons, for the magnificent emolument of £50 per annum. This might modify their views somewhat, and teach them, even while sitting upon their velvet cushions, made softer with a cheque for £5,000 as a slight annual acknowledgement of their *arduous duties*, that even beggarly-paid medical officers are gentlemen, quite as humane as their wordy and overpaid brethren of another profession, and equally conversant with their duties. An instance of this overbearing conduct on the part of Lord Chief Justice Coleridge was brought under our notice during the past few days by Dr. Rogers in his official capacity as Chairman of Council of the Poor-law Medical Officers' Association. The gentleman aspersed was Mr. Henry H. Taylor, F.R.C.S., Medical Officer of the Bishopwearmouth district of the Sunderland Union, and the case was briefly this. Mr. Taylor heard by rumour that the stepmother of a child named George Moss was keeping him almost without food and clothing. He went to the house—not in his official capacity as parochial medical officer, as he was never summoned by the parents or relieving officer, the case not being one of poverty but cruelty—he called out of kindness to the poor boy from rumours which reached him, remonstrated with the mother, and received in return considerable abuse from that irate individual. He called twice subsequently, told the woman what she ought to do, as it was food and clothing, not physic, the child required, and cautioned her what the consequences of her conduct might be. Finding matters did not improve, he, still unofficially, went to draw the relieving officer's attention to the case, as he had no faith in the step-mother's promises. On his way he met a police constable, who informed him that the police surgeon had seen the case, and, naturally, thinking the object was now gained, he did not call upon the relieving officer. The child, however, died of starvation, and the parents were sentenced to imprisonment. But Lord Chief Justice Coleridge had a medical man before him as a witness, and in accordance with time-honoured custom, told Mr. Taylor, who had acted so humanely in the matter, that, although he was not legally responsible, he was morally responsible for the child's death; he would disallow his costs, and write to the central authority on the inhumanity of his conduct. The misfortune was that Mr. Taylor, being somewhat deaf, did not hear these remarks, only catching the last words about disallowing costs, and did not like to ask his lordship to speak up; he therefore appeared to accept the censure without protest or explanation, when, in fact, he did not hear it. The case ought not to be allowed to end thus. Here is a medical officer, always known to have honourably discharged his duty, suddenly finding his fair fame blighted because a judge chooses to condemn him for not calling in the relieving officer, when he really did what every one under similar circumstances would do when he found the matter was in the hands of the police. Mr. Taylor has our entire sympathy, and we feel sure will gain that of the entire profession when the circumstances of the case are known. Dr. Rogers also has our best thanks for thus giving us an opportunity of vindicating the outraged honour of a professional brother.

Administration of Noxious Drugs.

At Bodmin assizes Lord Chief Justice Cockburn, after consultation with Justice Hawkins, delivered an important judgment on this subject. A man was charged with administering cantharides with a criminal intent. The judges ruled that there must not only be an administration of a noxious drug with a guilty intent, but the drug must have been administered in such quantities as to be noxious, whereas the dose here given was too small to be seriously deleterious. Distinction was drawn between a drug like cantharides, which is only noxious when given in excess, and strychnine, a well-established poison. Acquittal was therefore directed.

With regard to this judgment, we cannot help thinking that it will rather encourage than deter the perpetration of a crime which is but of too common occurrence, and that it will suggest to future criminals the means of evading the penalties of the law without flinching from carrying out the object they have in view. Is not this judgment, moreover, at variance with that generally passed upon another class of criminals? Is a criminal

who has nearly murdered another man acquitted on the score that, although his intent was to commit murder, the means he took were not sufficient to effect his purpose? And who is to decide when a drug is noxious and when it is not? Who does not know that a dose of cantharides or of savin that would in one case be attended with serious consequences, might in another case do very little harm. At all events, we cannot say that the judgment is a satisfactory one, and hope that it will not be taken as a precedent in future trials of a similar nature.

English Doctors in France.

THE Paris correspondent of the *Standard* has recently given some interesting particulars respecting the progress and prospects of M. Marvaise's Bill, which, having been adopted by the Committee of Initiative, will shortly be brought forward in the Chamber of Deputies. Although, as we noticed on a previous occasion, the French Government had determined to oppose the Bill, the interest, says the writer, of French doctors both inside and outside the Versailles Assembly is very considerable, and it is still expected that a great effort will be made to pass the Bill through the House.

In the *Journal des Débats*, which decidedly opposes the Bill, there is a letter from Dr. Daremberg, of Mentone, in which that physician—while acknowledging the impolicy and injustice of compelling foreign doctors to undergo the five probationary examinations required by the French laws, insists upon the advisability, and even the necessity, of requiring them to pass the fifth and last examination. As this would only consist of about an hour's oral and clinical examination, we do not, for reasons which we have already given, think that the proposition is at all unreasonable. Indeed, such a rule is, in the opinion of Dr. Daremberg, justifiable and necessary from every point of view; for under the existing *régime* the science of medicine is permitted to be practised in the sanitary resorts of France by unauthorised quacks, who possess some fantastic sort of diploma or other which would give them no right to practise in their own country. Such toleration is disastrous to the medical reputation of French sanitary resorts, and affects the honour of the medical profession. These dexterous individuals insinuate themselves into the good graces of hotel managers, boarding-house keepers, agents for furnished lodgings, and others who are more or less in a position to recommend them, at the winter stations in France. Moreover, in France, whether rightly or wrongly, the medical career is closed by almost impenetrable barriers; it would, says Dr. Daremberg, be absolutely ridiculous to throw wide open to foreigners a door which is closed to Frenchmen.

Nevertheless, the *Journal des Débats* is confident that the Bill, as it at present stands, would be equivalent to the absolute exclusion of foreign practitioners from practice in France. The whole question, says that paper, concerns only the English and German doctors; and the Bill, if passed, would be the ruin of the most prosperous thermal resorts in that country—such as Nice, Mentone, Cannes, Hyères, Pau, Biarritz, as well as a large portion of Normandy and Brittany, which are peopled by foreigners, principally English.

"Now," says M. Lemoinne, "we know what an Englishman is in good health; what must an Englishman be when ill? The English cling to their nationality even in sickness and in their medicines; they must have English doctors and English medicines; they insist upon dying as they have lived—*à l'Anglaise*. The real question at issue is as to whether men who have received authority to practise medicine from the first scientific bodies of Great Britain (such as the Royal College of Physicians, the College of Surgeons, the Universities of Oxford, Edinburgh, or Dublin) shall be obliged, in order to practise in France, to undergo further examinations as students. All we can say is that such a measure is one of absolute exclusion, and would ruin the sanitary resorts of France, to the advantage of those of Italy and Spain; it would be a miserable counterfeit of the revocation of the Edict of Nantes."

We must congratulate ourselves in having, in M. Lemoinne, such a good champion of English medical interests; but although we would object strongly to a Bill which would have for its object the total exclusion of English practitioners from France, it would surely not be unreasonable for the French medical authorities to require of English practitioners desirous of practising in that country the same credentials as those required of Frenchmen who wish to practise in England.

We hope, therefore, that some compromise may be made between those who would not have the slightest restriction placed upon foreign practitioners, and those who would adopt such measures as would amount to nothing less than their absolute exclusion from France, and especially from those health resorts where their presence is so much needed, and where their exclusion would be the means of driving English invalids to other and more favoured places.

Opium or Uræmic Poisoning? A Medico-legal Question.

IN the *Philadelphia Medical Times* for January there is a full report of a case which is very interesting in a medico-legal point of view, and which at the same time shows the danger attending the use of opium in Bright's disease.

A stout and apparently robust healthy man, about 45 years of age, after indulging in some drinking went about 1 a.m. to the home of a Mrs. Bella McClain, a woman of disreputable character. The next time he was seen, about 4 a.m, when he came to the bar apparently stupid but able to walk. He then found he had lost his watch, and soon afterwards, while trying to put on his shoes, he fell down in an unconscious state. When medical assistance arrived he was labouring under all the symptoms of opium-poisoning, and for a long time he could not be aroused by any means whatever. The history of the woman, who had drugged other men, both in Boston and Philadelphia, made it probable that she had administered a comparatively small dose of morphia for the purpose of drugging, and then robbing him. Small doses of atropia were exhibited hypodermically with some success, but he ultimately died without being restored to consciousness, and death was preceded by slight pitting under the malleolus, slight albuminous urine, and dilated pupils. On the trial of Mrs. McClain for murder, it was shown by the coroner's physician that his brain was congested and his kidneys granular, and that there existed chronic in-

terstitial nephritis in an advanced degree. No morphia was found in the stomach, but undoubted traces of it were found in the urine which had been drawn off while he was alive. The result of the trial was, that Mrs. McClain was convicted of murder in the second degree, and was sentenced to six years' imprisonment.

Dr. W. W. Keen's remarks on the case are likewise worthy of notice. The possibly dangerous effect of even small doses of morphia in chronic Bright's disease is not so widely and thoroughly known as it should be by the profession. Intolerance of the drug, says Dickinson (on Albuminuria) is one of the peculiarities of this disease, and the comatose state often comes on before its time in consequence of the administration of opium. Roberts also gives an instructive case in which the administration of a few drops of laudanum was followed by coma and death, and two others in the uræmic coma were mistaken for narcotic poisoning.

With respect to the diagnosis in these cases, it is often difficult to decide how far the symptoms are due to the opium, and how far to the induced uræmia. In the above case the narcotic symptoms were so decidedly in excess as entirely to mask those due to uræmia. The good effects of the atropia were very marked, and tend to confirm the belief that is entertained respecting the therapeutic antagonism of the two drugs. In this case, observes Dr. Keen, the atropia was a peculiarly fortunate choice, for its marked diuretic properties it was the best possible remedy to arouse the functions of the kidneys, and thus at once to eliminate the opium and mitigate the danger of uræmia.

It appears that, relying upon Taylor's disbelief in this mode of treatment, an attempt was made at the trial to show that the atropia was in part responsible for the patient's death, an objection which was met by the fact that only three doses of 1-30th of a grain of the alkaloid were given at long intervals, at 8 and 10 a.m. and 2 p.m.

Roots of a Vegetable Plant Swallowed by a Hysterical Female.

Dr. Heitzman, at a recent meeting of the New York Pathological Society, exhibited the roots of a vegetable plant which had been partly digested. The specimen had been sent to the doctor for microscopical examination by a physician. The patient had complained to him that she was in the habit of passing through her anus this kind of substance. After receiving Dr. Heitzman's report as to its nature, the doctor had apprised her of the fact, but she denied *in toto* ever having swallowed the kind of plant mentioned. However, she has passed none of that substance since.

Dr. Heitzman regarded the case as one of hysteria, and in this connection referred to one reported at the last meeting of the Society, in which the woman had swallowed fragments of a sand (neries) worm.

Salicin used in 1840.

At the present time, when the use of salicin and salicylic acid has become so fashionable, it is interesting to know that its employment in medicine is not a novelty, and that thirty-seven years ago, Dr. Feurio (Mantua) tried it in one hundred and eight cases of intermittent fever, and with the exception of two where he was obliged to repeat the dose (24 grains), it prevented the approaching paroxysm (Omodei Annali Universali.) He found its action was quickest when given in powder, the raw salicin being more powerful than the purified, and he never saw any ill results from its use.

Typhoid Fever and Drinking Water.

In the January number of the *New York Medical Journal* there is a short communication from Dr. Julius A. Root, in which the bad effects of impure water are strikingly illustrated.

It had been long noticed that typhoid fever was confined to a particular part of the city of Rochester, N.Y. In this district was a well, situated directly in front of a grocery and lager-beer saloon, and most of the persons who were ill used the water from this well, which (owing to the nature of the traffic and its proximity to the drinking saloon) received the surface washing, not only from the road, but from small cesspools of urine, manure, and filth which had accumulated around it. At first the well was closed, but as an analysis of the water made by Prof. Lattimore, of Rochester University, showed that there was apparently nothing which could be injurious to the health, and as, moreover, the people became clamorous to be allowed to drink the water, the Board of Health determined to make a house to house inspection. During this inspection, which included a large district, it was found that there were 40 families, or 219 persons, who used the water from the well, and that in these families there had been, during the past season, twenty-three cases of typhoid fever. There were also 47 families, or 271 persons, who used water from other sources, and in these families there had been only two cases of typhoid fever. After closing the well there were no more cases of typhoid in that neighbourhood than in any other part of the city.

"Comparing," says Dr. Root, "the diseases of a zymotic character in the forty families who used water from the condemned well and diseases of the same nature in the forty-seven families who had water from wells better protected, we can draw but one conclusion."

The case also shows that a chemical and microscopical examination of water is not always sufficient to warrant the opinion that it may not be of itself the direct cause of disease. As the same writer observes, we have here a further proof that wherever typhoid fever makes its appearance there is a violation of some sanitary law.

The magistrates last week fined two holders of sham Philadelphian degrees at Hull, £20 each for illegal practices.

H.R.H. the Prince of Wales will formally open the new wards of Charing Cross Hospital on Wednesday, the 21st inst.

The Hospitals' Football Challenge Cup was last week won by Guy's Hospital, its team having beaten all comers.

At the Lincoln Assizes last week, a labourer was sentenced to fifteen years' hard labour for administering strychnine to a widow in order to procure a miscarriage.

NAPLES and Buda-Pesth are in a terribly unhealthy state at the present time; the rates of mortality having risen to 44 and 46 per 1,000 of the population in these cities.

THE annual death-rate of the population, last week, in the four principal cities of the United Kingdom, was 20 per 1,000 in Edinburgh; 23 in London; 29 in Glasgow; and 32 in Dublin.

SALFORD and Bristol showed the highest rates of mortality last week of any of the towns in the United Kingdom. There were 34 deaths per 1,000 of the population in each, according to the Registrar-General's official returns.

THE deaths from small-pox were 103 last week, against 118 in the previous week. Of these 6 occurred in London, being 20 less than the last return; 12 in Liverpool; 5 in Manchester and Salford; and 1 each in Leeds and Newcastle-on-Tyne.

HIS Grace the Duke of Marlborough, Lord-Lieutenant of Ireland, and His Royal Highness the Duke of Connaught, have signified to Mr. Ormsby their acceptance of the office of patron of the National Orthopædic Hospital of Ireland.

THE Lumleian Lectures of the Royal College of Physicians of London will be delivered on March 16, 21, and 23, by Dr. George Johnson, "On the Muscular Arterioles, their Structure and Function in Health and in certain Morbid States."

ON Saturday last four students of Glasgow University were each fined £10, or six days' imprisonment, for disorderly conduct. On Friday night several hundreds of them visited the newspaper offices in Glasgow, hooting and applauding according to the politics of these papers. They paid the fine, expressing regret at their conduct.

EARL PERCY intends, on the second reading of the Vaccination Law (Penalties) Bill, fixed for March 14th, to move, "That before considering any proposal for the readjustment of the penalties imposed by law on its neglect, it is desirable that an inquiry should be instituted with regard to the practice of vaccination in this country, for the purpose of ascertaining whether it cannot be conducted in such a manner as to remove all reasonable objections to it."

WE are glad to find from the last quarterly report of the medical officer of health for Hastings, that that popular invalid resort is in so healthy a state that little fear need be entertained of its having survived the rude shock which certain sanitarians brought about last year, in consequence of the unsatisfactory nature of the water supply. We are pleased also to notice that sanitary improvements are continually going on, in the filling up of cesspools, wherever discovered, improving defective drainage, &c.

A DISTRESSING accident happened recently in America, by which a local practitioner lost his life. He was illustrating the use of the syringe for the hypodermic injection of morphine, so that a young lady could administer it, when necessary, to her mother. He had the syringe filled with water, and made a slight puncture with it in his own arm. The syringe had something in it which poisoned him, and notwithstanding everything was done which could be he died.

The occurrence suggests the inquiry whether young ladies ought to be instructed in the free use of the hypodermic syringe, and whether a trial on the doctor is a proper method of instruction.

THE chair of anatomy and physiology in the University of Otago, New Zealand, having become vacant, applications from candidates for the appointment are invited. The salary will be £600 per annum, besides the class fees, which are £3 3s. for each student per term of six months, commencing in May of each year. An adequate allowance will be made for passage money and outfit. The age of candidates should not exceed thirty, and they must be possessed of qualifications such that home universities would approve of them as competent medical teachers. They must be university men, and have a medical degree. A degree in arts besides will be deemed a recommendation. It is distinctly to be understood that private practice will not be permitted.

THE ARCTIC COMMITTEE.

THE Committee appointed by the Admiralty to inquire into the cause of the outbreak of scurvy amongst the men of the late Arctic Expedition, have agreed to their report. Sir George Nares, it appears, is alone to blame in the matter; for, although it is expressly ordered in the official memorandum of the Director General of the Medical Department of the Navy that sledging parties should be provided with a proper quantity of lime juice, and Dr. Colan called his particular attention to this, he objected, because it *would increase the weight* to be carried, and thought rum might be substituted. When it was first announced that four men had fallen victims to scurvy, and also that a large number of men had suffered from the disease, and almost compelled the Expedition to return home. it was thought to be incredible, and we own to having shared in that incredulity. Since, however, it has become known that some of the officers of the Expedition entertained very erroneous and wilful notions on the value of lime-juice in the prevention of scurvy, it was thought necessary that an investigation should take place, and it cannot be disguised that Sir George Nares has incurred a very grave responsibility in this instance. He not only thought proper to disregard the orders of his superior officer, but put aside the accumulated experience of the medical profession, and innocently asks the public to accept as an excuse for wrong-doing, "that during the preceding month he had voluntarily served out two ounces of lime-juice to his men, instead of the regulation allowance of one ounce, thinking by *so doing his men, by the time of starting, would be saturated with lime-juice.*" It is scarcely possible to believe a man can be in his right senses to jump to such a conclusion! What follows is even more irrational. Being asked why he had disregarded Sir Alexander Armstrong's recommendation, he replied, "he did not attend to it because of the loss of time necessarily involved in thawing the water to mix with the lime-juice, and of the difficulty of extracting the frozen lime-juice from the bottle in which it would be obliged to be carried." Furthermore, "he considered all good food antiscorbutic." It is almost incredible to conceive that a clever man should have uttered such childish nonsense.

Commodore Markham, it appears, in spite of what has occurred, still entertains his own inflated notion of the value of lime-juice. He stated before the committee that if he were once more starting with a sledging party, "*he would not encumber* himself with lime-juice, as he *does not consider it a preventative of scurvy.*" It is devoutly to be wished that he may never again find himself in charge of an Arctic sledging party, otherwise, on his return home, he might be called upon to account for his obstinacy before a legally constituted tribunal, and not a committee. But for the timely supply of lime-juice, which his men discovered left behind by the *Polaris*, and which was in good condition, in all probability many of Commander Markham's men would have shared the fate of those who were not fortunate enough to meet with this much needed agent. It is incontrovertible, as Professor De Chaumont said, that if the whole of the sledge rations had been from first to last fully consumed and assimilated by the men, which was not the case, they would have been insufficient to repair the waste of tissue consequent on their great exertions. When to this important fact is added another of greater weight, the *total loss of vegetables and lime-juice*, we have not far to look for the cause of the outbreak of scurvy. A morning contemporary truly says, "It is a matter of deep regret that Sir George Nares and Captain Stephenson should have needed such terrible experience to satisfy themselves of a truth demonstrated and acted upon in the navies of every civilised state for upwards of a century."

Obituary.

DR. ARTHUR GOFF THOMPSON, OF BALLINA.

It is with extreme regret that we have to record the death of this most estimable member of our profession, which sad event occurred on Tuesday, the 6th inst., at his residence, Ballina. Dr. Thompson came of a good family, and up to fourteen years of age was generally accepted as the heir to the large property of his uncle, and was brought up in all the surroundings attached to such a position. About that time, however, his uncle married, and having a family, these roseate expectations vanished into thin air, and nothing was left the subject of this notice but to select a profession, and to enter on the battle of life on his own account. Having in due time selected the medical profession, he pursued his studies in the school of the College of Surgeons, and in the wards of the Meath Hospital, and in the year 1843 became a licentiate of the Royal College of Surgeons, and in 1847 a licentiate of the Apothecaries' Hall. Some time after that he entered on general practice in Dalkey, where he was commencing to gain reputation when the militia was called out, and through the influence of Sir Philip Crampton—who entertained a warm regard for him—he was appointed surgeon to the Leitrim Rifles, with which regiment he did service until its disembodiment, when he was elected medical attendant to the Ballina Dispensary, when he took up his permanent abode in Ballina. Here he soon won for himself the esteem and confidence of all with whom he came into contact. Those who once became his patients were sure to become stedfast friends, for they experienced the skill of an accomplished physician and the liberal kindness of a most warm-hearted, generous man. In the treatment of infantile disease he was especially successful, seeming to have an intuitive perception of the little ones' ailments, and so he continued his arduous labours, alike respected and beloved by rich and poor, nor could it be otherwise. Simple-minded as a child, warm-hearted and generous to a fault, the soul of truth and of honour, he was the very kind of man to command not only the regard but the love of all who knew him. Some two years ago, in going his professional rounds, he sustained a severe injury of the knee-joint, at injury so severe as to compel him to resign his connection with the dispensary, although he still was enabled to discharge the duties of surgeon-major of the North Mayo Rifles, into which corps he had some years before exchanged with Surgeon-major Franklin; but from that date his health began to decline, and last summer unmistakable signs of cardiac and hepatic mischief developed themselves, from the symptoms of which, however, under appropriate treatment, he obtained some temporary relief. Early in this year, however, the symptoms returned in an aggravated form, and despite the skill and unremitting care of his old friend, Dr. Atkinson, of Ballina, and of his colleague in the North Mayo Rifles—Dr. Nolan—with whom in his treatment were associated Dr. Henderson and Mr. Rawdom Macnamara, of Dublin, he rested from his labours, and now sleeps the sleep of the true, the just, the honest—in a word, of the Christian.

DR. RICHARD N. TOWNSEND, OF QUEENSTOWN.

It is with the deepest regret that we have to record the death of Dr. Richard Newman Townsend, which melancholy event took place at his residence in Queenstown on the 3rd instant, and resulted from an attack of typhus fever contracted in the discharge of his duty.

Dr. Townsend graduated in Arts at Pembroke College Oxford, in the year 1859. Whilst an undergraduate, he was distinguished both for his literary attainments, and for his skill as an oarsman; and during this period was once a member of the University eight at Putney, a post so coveted by all the frequenters of the Isis.

In 1861 he took the degree of Licentiate of the Royal College of Surgeons, Ireland, and shortly afterwards he was admitted to a similar degree in the King and Queen's College of Physicians, Ireland, and last year he was admitted a Fellow to that Body. He was for some years previous to his death, surgeon to the Royal Cork City Artillery. Upon completing his studies in medicine, he was appointed medical officer of the Kilshannig dispensary district near Mallow; after some years he was elected to a like post in the Carrignavar dispensary district, and since the year 1874, he held a similar position in Queenstown. The announcement of his death was looked on by numbers of the humbler classes, to whom he had especially endeared himself by the kindness of manner and the skill he brought to bear in treating their diseases as almost a family bereavement; and many a tear was dropped in silent testimony of his worth when the sad news was carried home, that the kind hand that had so often raised the latch in the fever-stricken home was now, by that same malady, for ever laid powerless. Dr. Townsend has added one more name to the roll of Irish dispensary doctors who have died in harness, manfully doing their duty. Fearlessly and noiselessly in the fever-stricken hovel, or in the atmosphere of small-pox, they appear to almost court the grim horror of an untimely death.

Dr. Townsend has been taken from a career of usefulness at the early age of 41, leaving to a widow and almost infant family an irreparably great loss, and to his relatives the consolation that in his private life he was irreproachable.

On the announcement of his death, every shop put up a sign of mourning, and all the vessels in the harbour had their flags half-mast high. His funeral which took place on the 4th inst., was attended by upwards of two thousand people of all classes, from Queenstown and the surrounding district, where Dr. Townsend has left a hundred grateful recollections of his humanity to the poor and suffering upon whom it was his wont to bestow his charity as well as his skill. The hearse was preceded by a guard of honour of the Cork City Artillery. After it came the chief mourners and the masonic brethren. Upon arriving at the graveyard, the coffin was taken from the hearse and borne to its last resting place by persons moving in the same rank of life as the deceased, and who also subsequently lowered it into the grave. The Rev. Maurice Collis, D.D., read the funeral service, and

delivered a touching address on the many virtues of the deceased, and on his untimely and much lamented death. In the Roman Catholic churches the officiating clergymen spoke in the highest terms of the deceased, adding that it would be very hard to replace him and to find another that would give the same satisfaction to the poor of every denomination.

The Queenstown Town Commissioners on passing a vote of condolence to Mrs. Townsend, stated that "no one knew what he did in charity," and that they "considered him as great a hero as any that ever fell on the field of battle."

Medical News.

Medical Society of London.—At the general meeting of this Society, held on March 5th, the following gentlemen were elected to the several offices named:—President: Dr. George Buchanan. Vice-Presidents: Dr. Thorowgood, Mr. F. W. Braine, Dr. Leonard Sedgwick, Mr. Richard Davy. Treasurer: Mr. T. H. Hill. Librarian: Dr. Theodore Williams. Secretaries in Ordinary: Dr. Clement Godson, Mr. J. Astley Bloxam. Secretary for Foreign Correspondence: Dr. T. S. Dowse. Council: Drs. John Brunton, T. Lauder Brunton, Farquharson, Sir Joseph Fayrer, Fothergill, Constantine Holman, H. Lawson, Robert Semple, and Wiltshire; Messrs. William Adams, W. Allingham, H. Royes Bell, Thomas Bond, W. B. Dalby, John Gay, J. D. Heaton, C. F. Maunder, W. D. Napier, Erasmus Wilson, and J. C. Wordsworth.

Poor-law Medical Officer's Association.—At a meeting of the Council, held at 3 Bolt Court, London, E.C., on Tuesday, 6th March, it was resolved that this Council (having taken into consideration the statement of Mr. Ashburner, medical officer of the Horsham workhouse, in reference to the conduct of Dr. Kelly, medical officer of health for West Sussex combined district), begs to express its condemnation of the course pursued by that gentleman, and trusts that the Local Government Board will issue such general instructions as will preclude the possibility of such action being followed by any medical officer of health towards any Poor-law medical officer in future. That a copy of this resolution be forwarded to the medical journals and to the Local Government Board.

The Cattle Plague.—Replying to an inquiry on Monday the 12th inst., Lord Sandon said that unfortunately a case of true cattle plague was discovered in Lincolnshire on Friday last. The animal was at once slaughtered, as well as twenty-four other beasts on the farm, so as to prevent the possibility of spreading infection. The chief inspector of the Privy Council was on the spot, investigating the cause of the outbreak.

NOTICES TO CORRESPONDENTS.

☞ Correspondents requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

Reading Cases.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the Medical Press and Circular, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

Errata.—In the letter which appeared in our last on "Unqualified Assistants," page 194, line 39, *persuaded* should read *pervaded*, and two lines further, *horror* should read *honour*.

Harveian Society of London.—On Thursday evening Dr. Hughlings Jackson will read a paper "On Affections of the Ear with Nervous Symptoms."

Medical Microscopical Society.—This Society will hold its monthly meeting on Friday at 8 p.m. in its new rooms at the Century Club, 8 Pall Mall Place, S.W.

Royal Institution.—On Tuesday next, at 3 p.m., Dr. Garrod, F.R.S., will lecture "On the Human Form; its Structute in relation to its Contour."

VACANCIES.

East London Hospital for Children.—Assistant Physician. Honorary Attendance required two afternoons each week. Applications to be made to the Secretary on or before the 22nd inst. (See Advt.)

Brecknock County Infirmary.—Resident House Surgeon. Salary £100 per annum. Applications to the Secretary.

Somerset County Asylum, Wells.—Assistant Medical Officer. Salary commencing at £100 per annum. Testimonials, &c., to the Medical Superintendent.

Liverpool Royal Southern Hospital.—Senior House Surgeon. Salary £105, with board. Applications to the Chairman of the Medical Board.

Wolverhampton General Hospital.—Surgeons' Assistant. Board and lodging, but no salary. Further particulars of Mr. Vincent Jackson 46 Darlington Street

Annamoe Dispensary, Rathdrum Union.—Medical Officer. Applications to Hon. Sec.

Louisburgh Dispensary, No. 1, Westport Union.—Medical Officer Salary, £100 per annum. Applications to Hon. Sec.

Crediton Union.—Medical Officer for the Cheriton District. Salary £45, with the usual midwifery fees. Address the Clerk, Union Offices Crediton.

APPOINTMENTS.

Broadbent, Dr. W. H., Hon. Consulting Physician to the Hospital for Women and Children, Vincent Square, Westminster.

Brocklesby, R., L.R.C.P.Ed. & L.M., M.R.C.S.E., Medical Officer for the Grimsby No. 2 district of the Caistor Union.

Capon, H. J., M.R.C.S.E., House Surgeon to the Dorset County Hospital, Dorchester.

Daly, Dr. J., Medical Officer, Public Vaccinator, &c., for the Clonmany Dispensary District of the Inishowen Union, co. Donegal.

De Denne, T. V., M.R.C.S., L.R.C.P., Assistant Medical Officer to the Northampton General Lunatic Asylum.

Henley, E. W., L.R.C.P.L., M.R.C.S.E., House Surgeon to the Whitehaven and West Cumberland Infirmary and Fever Hospital.

Leitch, J., M.B., C.M., Medical Officer for the Abbey Holme District of the Wigton Union, Cumberland.

Mackay, G., M.B., L.R.C.S.Ed., House Surgeon to the Dumfries and Galloway Royal Infirmary.

Pearce, Mr. H., Assistant to the House Surgeon of the General Infirmary, Northampton.

Ryder, Richard, M.D., L.R.C.P.Ed., L.R.C.S.I., Medical Officer to the Minchinhampton Charitable Dispensary, and to several Benefit Societies, vice Henry Pavey, M.R.C.S.E., resigned.

Stamp, W. D., L.R.C.P.Ed., M.R.C.S.E., Assistant Medical Officer to the Infirmary and Workhouse, St. Luke, Chelsea.

Welch, J. B., M.B., M.R.C.S.E., L.S.A.L., Medical Officer and Public Vaccinator for the Handsworth District of the West Bromwich Union.

Worthington, T. B., B.A., M.B., C.M., Senior Assistant Medical Officer for the Sussex Lunatic Asylum, Hayward's Heath.

Deaths.

Brownlie.—On Feb. 23, at Coventry, William Henderson Brownlie L.R.C.P.Ed., aged 28.

Burn.—On March 3, at Pelham Place, South Kensington, Dr. Alexander Burn, late of the Bombay Medical Service, aged 70.

Campbell.—On Feb. 26, at Crawford Villa, Maybole, John Campbell M.R.C.S.E., aged 46.

Davis.—On Feb. 25, at Torquay, William Farquhar Davis, F.R.C.S.E. Surgeon Major, Madras Army, aged 44.

Noble.—On Feb. 25, at Brixworth, Charles Noble, M.R.C.S.E., aged 70.

Ramsay.—On Dec. 9, at Colombo, Ceylon, Ebenezer J. Ramsay M.R.C.S., aged 27.

Stone.—On March 2, at Oldfield Terrace, Acton Vale, Thomas Stone F.R.C.S.E., aged 70.

Sweetnam.—On March 6, at Stoke, Devonport, Mary Eleanor Martha wife of Staff-Surgeon Sweetnam, of H.M.S. *Impregnable*.

Taylor.—On Feb. 25, at Shanklin, Isle of Wight, John Taylor, Surgeon, aged 30.

Webb.—On Feb. 27, at Basingstoke, Charles Webb, M.R.C.S.E. aged 62.

IRISH POOR-LAW INTELLIGENCE.

THE PROPOSED VACCINATION AMENDMENT BILL.

Observations upon proposed Changes in the Vaccination Laws of Ireland, drawn up for the Information of the Right Hon. Sir M. E. H. Beach, Bart., *Chief Secretary for Ireland, by* Albert O. Speedy, *Member of the Council of the Irish Medical Association.*

(continued.)

Clause VII. deals with penalties (taken from the English Act), *i.e.*, for preventing vaccinator taking lymph; for non-transmission of the certificate to the registrar. A defendant may depute a person to represent him in any proceeding where a parent fails to produce such child when summoned under this Act; where the parent or guardian neglects to have said child vaccinated within three months the penalty is not to exceed twenty shillings. Since the Bill was printed it occurred to the Council to add—"nor less than five shillings, inclusive of costs." There can be no doubt that, owing to the *ridiculously small* fines imposed by magistrates in some rural districts, the Act is, in such places, a bye-word; and actually the fine has been fixed at as low a figure as One Penny in some instances.

I perceive by the last annual report of the Local Government Board for Ireland, that pointed allusion to this matter is made in the following words:—"The complete vaccination of the population should be secured by sustained and continuous attention on the part of the registrars of births, medical officers of dispensary districts, and by boards of guardians, who are responsible for directing proceeding to enforce the provisions of the Vaccination Acts, and lastly and mainly, by a firm administration of the law by the magistracy, who are apt to show excessive leniency in dealing with these particular cases."

Clause VIII. imposes a penalty on the vaccinator and parents neglecting to transmit certificate, and persons signing false certificates. The Council consider its adoption would be useful.

Clause IX. is adopted from the English Act, its object being to prevent the parent of a child escaping a penalty for neglecting to have same vaccinated upon the technical ground that the registrar of births cannot prove that he gave a notice at the time of registration of birth. Owing to this defect in the law, several magistrates have allowed proceedings to fall through.

Clause X. provides remuneration to the medical officers of dispensary districts when called on to give evidence against defaulters. Under Section 13 of 26th and 27th Vic., c. 52, the justices have power to allow payment to the dispensary medical officer for such services; but, owing to some misconception, it frequently has occurred that such fees were not allowed. Under this 13th Section guardians may direct proceedings to be instituted against defaulters. There appears still to be indecision in rural official minds as to who the prosecutor in these proceedings is, and attempts have been made, from time to time, to place the medical officer in this disagreeable position. Two cases may be quoted of recent date bearing on this subject. In one of them the medical officer, in order to show that he was not the official prosecutor, declined to attend at petty sessions, on the requisition of the relieving officer, unless a summons were issued for him (the medical officer) as a *witness*, so that his proper place in the proceedings might be defined. The guardians complained to the Local Government Board, who called upon the medical officer either to resign or come forward voluntarily as a witness in such cases; and he was obliged to defray the costs of the prosecution. In the other case the medical officer declined to attend the court on the requisition of the board of guardians, the issue of which case was that the Local Government Board instructed the guardians to have a summons served on the officer, to secure his attendance in future.

The Council of the Association considered the matter of sufficient importance to place a case before Mr. Gerald Fitzgibbon, Q.C., for his opinion as to the legality of the power assumed by the Local Government Board in ordering dispensary medical officers to attend at court and give evidence in prosecutions under the Vaccination Acts, upon the direction of the guardians, and without receiving a summons from the Court; and also as to whether they could claim remuneration for such services.

Mr. Fitzgibbon's opinion is to the effect that the dispensary medical officers, acting as public vaccinators, are not bound to take part in prosecutions; that the fact of the medical officer's certificate being legal evidence, tends to show that his personal attendance at prosecutions was not contemplated by the Legislature; that his absence need not necessarily be fatal to a prosecution, whilst his attendance at court may be seriously injurious to, if not inconsistent with, the due performance of his professional duties; that the Local Government Board cannot prescribe a duty not imposed by statute; that a medical officer cannot be compelled to attend at prosecutions, unless by a summons from the court, the same as any other person; and that his refusal to attend, without summons, would not afford legal ground for depriving him of his office. He is also of opinion that it is the duty of the authorities directing the prosecution to provide sufficient evidence without trespassing on the time of the medical officers, or to fairly remunerate them; but that, however clear their rights may be they are not capable of being enforced; that the fee for vaccination does not include payment for attendance as a witness; that every medical officer who attends any prosecution ought to apply for a certificate for his expenses, which the justices ought to grant, though they cannot be forced to do so; and lastly, that if the medical officers refused to attend at prosecutions, the guardians might obtain summonses, and compel them by *subpœnâ* to attend, so that they would gain nothing by resistance, which would only aggravate the substantial grievance; their only course being to endeavour to obtain from the Local Government Board a regulation which will either preclude the necessity for their attendance, or fairly remunerate them for such services; or to seek redress from Parliament.

The Council would suggest that, in all such cases, a summons should be issued to the medical officer as for other witnesses, upon which document he can recover his fees. Once the medical officer's place in these prosecutions is clearly established, no magistrate can refuse a certificate, as the evidence of the medical officer is necessary to the proper hearing and deciding of the cases.

Clause XI. defines definition of the term public vaccinator.

Clause XII. is virtually a similar one to that in force in England, which regulates the transmission, by the registrar of births and deaths for any place, to the dispensary medical officer (where the office of Registrar is not held by the latter), of a list of births and deaths of infants under twelve months of age, born in the medical officer's district; by the adoption of which the dispensary medical officer would have a correct knowledge of all cases requiring vaccination; and, as there are over 70 persons who fill the office of registrar of births in Ireland, who are non-medical men, this clause would be of advantage.

Clause XIII. deals with the repeal of Acts in Schedule.

A. O. Spledy.

28, North Frederick Street, Dublin.
8 h February, 1877.

THE PUBLIC HEALTH "IRELAND" BILL.

The following Observations on the Public Health "Ireland" Bill, 1876, have been agreed to at a Meeting, held 12th of February, 1877, composed of a Committee of Representatives of the King and Queen's College of Physicians, Ireland; the Royal College of Surgeons, Ireland; the Irish Medical Association, and the Dublin Sanitary Association.

The objects of this Bill are to consolidate into one Act the various provisions with respect to sanitary matters and burial grounds of the several Acts, not less than twenty in number, now in force in Ireland, and to amend the same, where such amendments are required.

Sanitary Districts and Authorities—their Formation, Union, Separation, and Alteration.—The Bill adopting the provisions of the Act of 1874 proposes to divide Ireland into two classes of sanitary districts—urban and rural. The urban authorities to consist of corporations, and the town or township, commissioners of all the boroughs, towns and townships in the land, with a population of more than 6,000, as well as a few townships having commissioners under local Acts; in all forty-two in number.

We adhere to the opinion expressed in our Observations on the Public Health (Ireland) Act, 1874,—that urban sanitary districts should consist only of towns, the population of which, according to the last Parliamentary census, exceeds 20,000, as experience has proved that in places with smaller populations than this the means for efficiently carrying out the provisions of the Sanitary Acts do not exist.

We are of opinion that for the efficient carrying out of sanitary measures it is extremely desirable that there should be as much unity and simplicity of organisation as psssible, and, therefore, that in respect to proposals for alteration or union of sanitary districts, or the separation of portions of districts, the Local Government Board should have the power of taking the initiative in issuing provisional orders, after due inquiry, without waiting to be set in motion by the sanitary authorities, or at least that there should be some provision made for giving the inhabitants of any district, or a due proportion of the inhabitants, the same power of initiative as is conferred on the sanitary authorities.

We believe, that for the efficient carrying out of the provisions of this Act, it is necessary that the whole of Ireland should be divided into distaicts, for the purposes of sanitary inspection; that every such district should be subject to the supervision of an inspecting medical officer of health, such inspecting medical officers of health to be registered physicians and surgeons appointed by the Local Government Board.

With reference to the scale of remuneration to medical officers of health, for the services performed by them under this Act, we are of opinion that this is a question of administration rather than of legislation, except in case of attendance on board ship, in which case, the remuneration should, we think, be fixed at not less than one guinea for each visit.

We think that the titles conferred on various sanitary officers under the Act should be sufficiently descriptive of their duties as to be generally intelligible. Much confusion has arisen from the titles adopted in the Act of 1874.

We therefore recommend that the title medical officer of health should be substituted for that of "sanitary officer;" that the executive sanitary officer should be called "clerk to the sanitary authority;" and that the sub-sanitary officer should be styled "inspector of nuisance."

Infectious Diseases.—We are of opinion that provision should be made by every sanitary authority for the carriage of articles for the purpose of disinfection; for the retention in hospital of any person suffering from any dangerous infectious disorder, until in case of recovery, discharged therefrom, and in case of death, until removed direct to a mortuary, or cemetery; for the punishment (1st) of persons conveying, without due precaution, the bodies of persons who have died of any dangerous or infectious disorder; and (2nd) of persons who, in hiring a house or lodging, conceal the fact of contagious or infectious disease existing, or having existed in their families within a certain period.

Market and Slaughter-houses.—We recommend the insertion of a new clause, prohibiting the keeping of cattle in any urban sanitary district, without special licence, and providing for the making of by-laws for the management of such places for the keeping of such animals.

Hospital Accommodation.—The Bill does not make any provision for hospital accommodation. We therefore recommend the insertion of a clause similar to section xxxvii., 29 and 30 Vic., cap. 90.

Mortuaries, &c.—We recommend the insertion of a clause providing for a weekly return by the Registrar of every burial ground, of the names, causes of death, &c., of persons interred, to the Registrar of Births and Deaths of the district in which such person died.

THE PROPOSED VACCINATION AMENDMENT BILL FOR IRELAND.

The Council of the Royal College of Surgeons has addressed the following letter to the Chief Secretary:—

To the Right Honourable Sir Michael Hicks-Beach, M.P., *Chief Secretary for Ireland.*

Sir,—The attention of the Council of the Royal College of Surgeons in Ireland has been directed to two proposed Bills, one for the consolidation and amendment of the vaccination laws of Ireland, and the other simply for the amendment of same, these Bills having been prepared under the direction of the Council of the Irish Medical Association, in the hope of their approval by Her Majesty's Government, and of one or other of them being passed into law during the present Session of Parliament. The Council of this College, being aware that the law of vaccination in Ireland is in an unsatisfactory condition in many respects, and that perfect efficiency and universality of vaccination is, therefore, difficult of attainment in this country, regards the object at which these Bills aim, as most important to the health of the public, and would therefore, urge upon Her Majesty's Government the expediency of amendment of the existing system. The proposed Bills before the Council are based upon the extended experience of public vaccinators, and are, therefore, entitled to every consideration, and, upon perusal of them, the Council desires to express generally its approval of the amendments suggested, many of which, being an adaptation of the law now in force in England, have all the influence of long trial and satisfactory experience.

I am, therefore, directed by the Council of the Royal College of Surgeons, to recommend these Bills to your consideration, subject to such amendment as may seem to Her Majesty's Government desirable, and to express a hope that, if approved, you will accord to them your support in Parliament.

I am, Sir, yours &c.,
James Stannus Hughes,
Secretary of Council.

MONAGHAN SPRING ASSIZES.

(Before Mr. JUSTICE BARRY.)

THE ABUSE OF RED TICKETS.

Woods v. *Crumley.*

THE plaintiff in this case is the dispensary medical officer of Monaghan, and the defendant is a publican and a *quondam* member of Monaghan dispensary committee. The case, which has been now four times before the court at quarter sessions and assizes, was brought for the purpose of suppressing a wholesale and reckless issue of red tickets. It will be remembered when the action wasfirst instituted it was heard at quarter sessions in Monaghan, and a decree was given by the chairman for the sum claimed by Dr. Woods. But the defendant, who was fighting "on velvet," was not permitted to pay the amount, and an appeal was lodged. The appeal came for hearing before Mr. Justice Fitzgerald at last assizes, and that eminent judge characterised the offence complained of as a fraud, and dismissed the case in order that it might be brought into court as an action for fraud, and said if it were again heard by him he would give the utmost latitude to those who might be concerned for the plaintiff. In pursuance of this suggestion the case was again brought before the chairman, and a special counsel was brought from Dublin to defend it. On a point raised by him under the 11th and 12th Vic., viz.—"That no action or suit shall be commenced against any commissioner, or any other person, for anything done in pursuance of or under this Act until twenty-one days' notice has been given thereof in writing to the party or person against whom such action is intended to be brought." Upon this point the Chairman dismissed the case, and the present hearing was upon appeal from that dismissal.

Dr. Andrews, Q.C., and Dr. Porter, Q.C., instructed by Mr. Joseph Wright, appeared for the plaintiff, and Mr. Monro, instructed by Mr. Ross, appeared for the defendant.

Dr. Andrews stated the case, as it afterwards appeared in evidence.

Dr. Woods was examined, and said that he was the medical dispensary officer for Monaghan, and during the years 1874-5 the defendant had been a poor-law guardian and a member of the dispensary committee, and in his latter capacity had authority to issue red tickets—that is, tickets compelling the medical officer to visit patients at their own homes.

Judge Parry—Does each ticket represent a visit? No, my lord, each ticket represents a case; sometimes I have paid as many as eighty visits on a single red ticket. I remember in November, 1875, getting a red ticket to visit a Mrs. M'Geough, who lives about a mile from Monaghan. That was on the 4th. She was about to be confined. I saw her on the 4th, and had to operate to deliver her of her child. The case was a most difficult one. Both she and her child were saved. I saw her twice on the 5th, twice on the 6th, twice on the 7th, twice on the 8th, and twice on the 9th. Her husband is a national teacher, and she also is a teacher. I had remonstrated with Mr. Crumley about his indiscriminate issue of red tickets. However, he did not cease it; they were also issued by his wife, and he swore here that she was empowered to issue them. He is a publican. In one year he had issued over 1,100 tickets, and all the other members of the committee had only issued 1,600.

Judge Barry—Do you mean 1,100 in one year? Yes, my lord.

What was the sum you sued for? Three guineas. Is that all? Well, that is all I would have charged her as a private patient, though it would not have paid me. The defendant came on the morning of the 10th, at three o'clock, and demanded that I should go to see his wife, as she was suffering from retention. I said it was impossible, as I had relieved her the night before at eight o'clock, and I would be there in the morning. I told him, however, that his wife was suffering from hysteria, and I would send her a soothing draught to compose her, which he should give her as soon as he went home. He refused to carry the draught, and said he would report me to the Local Government Board, and call in another doctor. I told him he was ungrateful and impertinent, and that he might report me as soon as he liked, and call in whoever he pleased, and I ordered him out of my house. He went away. In the morning I was there at eight, and found that Dr. Ross had been called in. I was very indignant and turned away from the house.

Cross-examined.—I would have been annoyed no matter what doctor had been called in; but no medical man ever had treated me in the same way before. A private patient would have been perfectly well satisfied with my explanation, and have acted on my advice. My opinion as to the woman's state was borne out by what Dr. Ross afterwards told me.

Mr. Munro.—Did you visit Dr. Ross next morning? I did.

And you gave him the length and breadth of your tongue? I did, indeed.

Mr. Forster Dunwoody, hon. sec. to the dispensary committee, gave evidence of the number of tickets issued by Mr. Crumley during his year of office, which was 1,110. There were four red tickets cancelled on the 10th, all of which were Crumley's, on the ground that the parties were not entitled to them.

Mr. Munro referred the court to the various Acts, 11 and 12 Vic., &c., and amendments of Acts as set forth by Mr. Banks's compendium, and contended that this action was not brought or notice of it served within three months after the commission of the acts complained of.

Dr. Andrews contended that the acts construed by Mr. Munro did not apply in this case. It was controlled by another and a very different Act, the Medical Charities Act of 1851.

Judge Barry said he saw this case had been dismissed by the Chairman.

Dr. Porter said it had, but he dismissed it on the point raised by Mr. Munro, that the action was not brought, or notice thereof given within three months after the acts complained of were committed, and not on the point of fraud, for he held with Judge Fitzgerald that it was a fraud. On the merits of the case he had to say that Dr. Woods was paid £120 a year, and was obliged to keep two horses constantly for doing the work of this dispensary district, which extends over a radius of four miles, and includes 9,000 inhabitants. Fraud was the word which had been introduced into the process, but they did not rely on that altogether.

Judge Barry.—I believe if the word had been negligently, the action might be substantiated.

Dr. Porter.—But treating the case as if the word were not there, it was proved and not denied that Mr. Crumley had issued more tickets than all the other members of committee put together, and that these tickets had been given in several instances to persons who were not entitled to them, or contemplated by the act. The judge who had heard the case, before his lordship, had characterised it as a fraud, and he dismissed the civil process appeal in order that it might be brought in that way. When the tickets were brought before the dispensary committee, they cancelled them, because M'Geough was not a "poor person" within the meaning of the act. Then as to making M'Geough the defendant, no action would lie against him, because it was Crumley who had put Dr. Woods in motion.

Judge Barry said he thought according to Crumley's evidence, he had made as much inquiry as he (his lordship) would have made under the circumstances; and if a person represented to him that all the salary he had in the world was only £30, he would have given the ticket.

Dr. Woods was asked if he had inquired as to M'Geough's salary. He said he had, and the school manager, the Rev. Mr. McKenna told him that with results it was about £70.

—Dr. Porter argued that Monaghan was a small place, where most of the people knew each other; and if Mr. Crumley was so ignorant of Mr. M'Geough as he had represented himself he could easily have referred him to some other member of the Committee. But he had not done that. In fact, he admitted at the last trial, that he gave these tickets "to everybody."

Judge Barry said he entirely agreed with an observation that had fallen from Dr. Porter, that extremely under-paid medical officers in the country dispensaries should obtain protection from courts of justice, if the powers vested in those men who constituted dispensary committees were abused. He was not sure if Mr. Crumley did not exercise the authority vested in him with very considerable carelessness. But in this particular case, the word "fraudulently" had been introduced into the process. That had been done at the suggestion of one of the most eminent judges on the bench, and his suggestion had been acted on. Still, the respondent had not been sued as might have been—for negligence, carelessness, and recklessness in the issue of these tickets. If Mr. Dunwoody, that intelligent gentleman, who acted as secretary to the committee, had proved that case after case had been brought before the committee, and that time after time Crumley's tickets had been cancelled, he (Judge Barry) would consider that very strong evidence to lead him to the conclusion that he ought to give a decree. And he wished now to lay it down clearly, that wherever he found a dispensary committee-man, or any other person in power, issuing tickets in the wholesale manner complained of, for the purpose of harassing a hard-worked, ill-paid medical man—whenever he found that, he would give a very heavy and substantial decree. But he did not think that in this particular case Crumley had been satisfactorily proved to have done so, and therefore he would dismiss the appeal. He wished to add that he agreed with Mr. Monro, that while a judge was called on to protect a medical man against an abuse of power, he should be very slow to visit a Poor-law guardian with expenses for work imposed in the legitimate exercise of his functions.

[In the above case Dr. Woods has fought a case against odds in the interests of the profession. He was determined to follow up the case till he should either succeed or be beaten; and although technically he has lost the case, after trials fought single-handed, he has, we feel assured, taught a salutary lesson to guardians and committee-men within his district, which will deter them in future from an undue and oppressive exercise of their powers, which, notwithstanding the merciful view taken of the case by the judge, was pretty clear from the reports of the various trials of the case which have reached us.]

ATHY UNION.

PROPOSED APPOINTMENT OF A COMPOUNDER OF MEDICINES FOR THE WORKHOUSE.

The Clerk read the following from Dr. O'Neill's report book:—

"I beg to inform the guardians that I find it quite impossible to do the work of physician, surgeon, and apothecary to the workhouse and fever hospital at present, owing to the nature of the diseases prevalent amongst the patients, and the very large number of the latter, unless I spend nearly half my time amongst them. Under the circumstances I take the liberty of suggesting the propriety of appointing a compounder for these institutions, and I feel confident so far from increasing the expenses, such an appointment would tend greatly to their reduction."

Mr. Lyons—How will it tend to a reduction?

Clerk—At present there is an increase of about thirty-five patients.

Mr. O'Beirne—But that may come down next week.

Dr. O'Neill—It is quite impossible for me to devote time to the compounding of medicines that should be spent with my patients. No one man could go through the house in less than two hours.

Mr. Fennin—Is it not a fact that the doctor gets his medicines compounded from Dublin?

Dr. O'Neill—So I do; but I find the medicine bills are so high at present that I am quite prepared to give a guarantee that if the compounder be appointed, it will lessen the expenditure under that head. My idea is to have the medicines brought down in their crude state, and compounded in the house; by so doing, I am quite sanguine of reducing, instead of increasing the rates. If I do not succeed in doing so, I will defray the expense of the compounder's salary out of my own pocket.

Mr. Lyons—What salary would you think we would have to pay the compounder?

Dr. O'Neill—About £30 a year.

Mr. O'Beirne—If you are so sanguine, doctor, of effecting a saving, why not appoint and pay the compounder yourself?

Dr. O'Neill—Certainly not. If I effect a saving, it is the guardians will benefit by it, and not me; therefore they should pay for what has brought about that saving.

Mr. O'Beirne—It appears to me a most inconsistent thing to appoint a compounder, when we already pay for these medicines being compounded in Dublin.

Dr. O'Neill—I may also tell you that if I had more time to devote to the consideration of the dietary, I am quite certain of being able to effect a considerable saving saving of the rates.

Mr. O'Beirne—It is stated that there is a considerable increase in the number of patients and the cost of medicine.

Clerk—There is. The cost of medicine is increasing by about £25 a year. The number of patients in the fever and infirmary hospital for the week ending February, 1875, was 73; in 1876, it was 82; and in 1877 it had risen to 109.

Dr. O'Neill—I will guarantee that under the system I propose the cost of medicines does not exceed £60 a-year.

Mr. D. Whelan—It speaks very highly for the manner the hospital is conducted, to see so many patients coming in.

Mr. W. Lee—My opinion of that is that the dispensary doctors are too prone to send every case in here that is likely to give them the slightest trouble.

Mr. O'Beirne—That is exactly my opinion too.

Mr. Lyons handed in the following notice of motion:—"I hereby give notice that on this day fortnight a qualified compounder of medicines be appointed to the workhouse for at least one year."

TO GENERAL MEDICAL PRACTITIONERS, APOTHECARIES, AND PHARMACEUTICAL CHEMISTS.

NAAS MEDICAL HALL TO BE SOLD.

This Establishment, which has been successfully conducted by the present Proprietor for the last Forty-Six Years, is now offered for Sale.

It is in full working order, well supplied with the best Drugs, Patent Medicines and Perfumery, with an extensive and influential connection, extending for Ten Miles round the Town of Naas.

The House is situate in the most commanding part of the Town—contains 12 Apartments, with Coach-House and Stabling for 3 Horses. A Lease of 21 years can be given, rent—£40 a year.

The Purchaser can have a detached walled-in Garden, well stocked with Fruit Trees, for £5 a year.

As this is a *bona fide* Concern, with an Incoming of nearly £1000 a year, no person need apply who is not able to pay £400 down and give good security for the payment of £500 more, within three years.

As the Proprietor intends residing within a Mile of Naas, he will be enabled to render material support the Establishment.

Naas is the Assize Town of County Kildare; a Military Brigade Depôt, Central Poor Law Union, and within One Hour of Dublin by Rail.

Applications to be addressed to the Proprietor,

ROBERT S. HAYES.

Pathological Anatomy of the Brain

LOCALISATION IN CEREBRAL DISEASE.

By Prof. Charcot.

Chapter XVI.

Gentlemen,—Certain recent researches by M. Meynert have furnished us with important data. One of his auditors has published them in the form of a book (M. Huguemin, Zurich); they consist of dissections, and examination of sections.

The brain is placed on its base, and the lateral ventricles are opened in such a manner as to expose the upper surface of the central ganglia, still attached to the different parts of the isthmus. After which, by a careful dissection, we successively remove—(1) The upper layer of the peduncle. (2) The corpora quadrigemina. (3) The whole thalamus.

Having done this, we find the crusta, or lower layer of the peduncle, and higher, in the region of the internal capsule, the fasciculi of fibres which are on their way to the nucleus lenticularis, are in a deeper plane, and are exterior to the last named fasciculus.

By carefully observing the more internal and posterior part of the fan formed by the nerve fibres, laid open by the preparation, we distinguish a fasciculus rather detached, which, without penetrating the substance of the grey nuclei, bends back at the point where it touches the under surface of the lenticular nucleus.

Here there is then, a direct fasciculus, the fibres comprising it entering the corona radiata without being arrested in the grey substance of the central masses; it is a separate fasciculus.

What is the destination of these nerve fibres? In man it is almost impossible to say, but in certain monkeys, M. Meynert states one can easily follow their course in the substance of the white matter of the occipital lobe, immediately outside the posterior course of the lateral ventricle. They end at last in the grey cortex of that lobe.

Is there any anatomical reason for thinking that the fasciculus with which we are concerned is really composed of centripetal fibres, having the function of transporting sensitive impressions to the surface of the back of the brain. M. Meynert thinks that it is so, on the ground that by the comparison of their sections, these fibres could be followed as far as the protuberance, the whole length of the crus or peduncle, running in the inferior layer, on the outer side—arrived at the protuberance, they took their position in the hinder part of the pyramidal fasciculus, and kept nearly the same place in the anterior pyramid as far as the level of the decussation. Having reached this point (contrary to the course taken by the more internal fasciculi of the pyramid, which run in the lateral columns of the cord), they passed, after decussating, into relation with the posterior columns.

I could not confirm the correctness of the course attributed by M. Meynert to these fibres. Interesting as these data are, they are insufficient for the solution of the problem, without the support of facts obtained by pathological enquiry and experiment; and we must once more repeat, that physiological and pathologial knowledge cannot be deduced from consideration of anatomical facts alone.

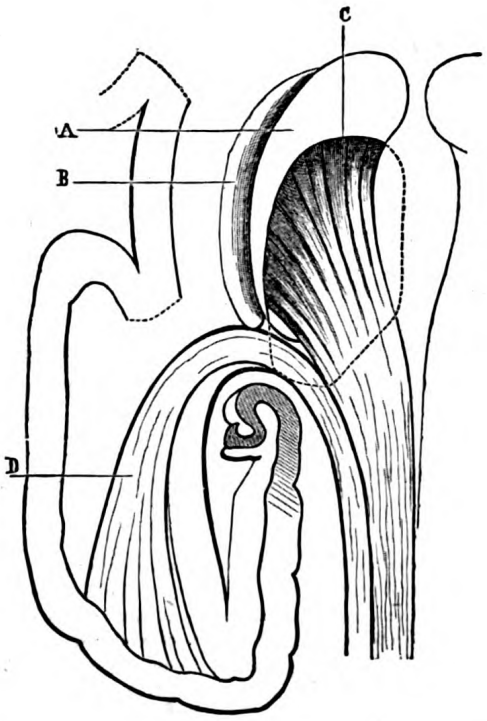
C.—The time has come for the introduction of clinical and anatomical evidence—which is now abundant. It is enough to mention the observations of Ludwig, Turck, of his compatriot Rosenthal, those which I have collected at the Salpétriere, those which M. Veyssiére and M. Rendu have added.

From combining and comparing these observations, it is very clear that lesions affecting the posterior lenticulo-optic region of the internal capsule produce, as their necessary consequence, the form of hemi-anæsthesia called cerebral, in which the senses over which the cerebral nerves proper (optic and olfactory) preside, can faithfully represent the characters of hemi-anæsthesia of the hysterical; but on the other hand, in all cases where the lesions involve that

part alone of the capsule contained between the lenticular nucleus and the head of the caudate, anæsthesia is wanting.

These data, furnished by pathology and clinical observation, by themselves have the greatest importance, but when backed up by anatomical data they are, so to speak, invaluable

FIG. 16.



A, Corpus striatum; B, Lenticular nucleus; C, Peduncular fibres passing to the corpus striatum; D, Fasciculus of peduncular fibres passing to the cortical substance of the occipital lobe.

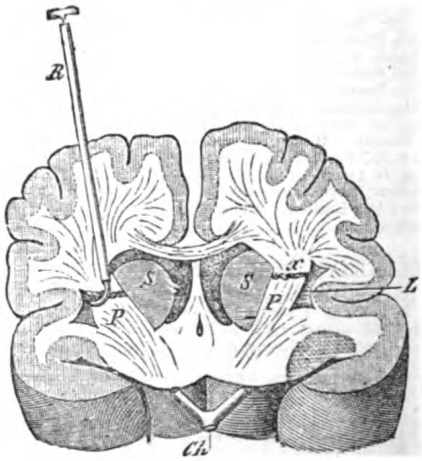
Experimentation has also yielded its share of evidence on the same side. It has been corrected and assisted by what was known pathologically. We might have been led to believe that the centre of sensory impressions was neither in the brain proper, nor in the thalami, but deeper in the protuberance (pons?), or perhaps in the crura cerebri. Against that view pathology protested by showing that a lesion situated higher than this point, in certain regions of the brain itself, constantly causes total anæsthesia. New experimental researches, made in France in the laboratory of M. Vulpian, by Durst and Veyssiére, have given results confirming our pathological knowledge.

An ingenious instrument, consisting of a trocar, from which a spring can be made to escape, is introduced through the cranial walls, into the central masses, to a depth and in a direction previously calculated. It is possible in this way, with a little practice, to injure only the two parts of the internal capsule.

If in trials thus made the lesion affects the *posterior* part of the capsule, hemi-anæsthesia of the opposite side of the body follows most certainly, in most cases it is attended by a certain amount of motor paralysis. *Motor* affection, on the other hand, appears alone without anæsthesia whenever the lesion has avoided the posterior third of the capsule, and affects any point whatever in the *anterior* two-thirds.

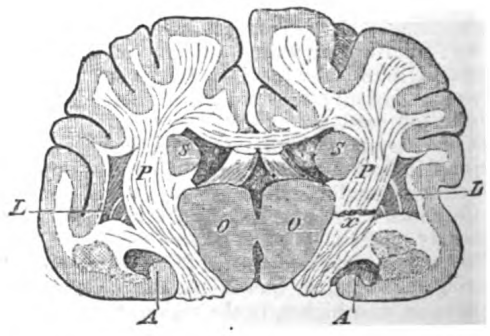
That is the general result of these experiments; and everything concurs, as you perceive, to show that certain centripetal nervous fasciculi exist in the posterior part of he internal capsule, whose function it is to convey centrally sensitive impressions from the opposite side of the body. Starting from the crusta of the crus cerebri, these fasciculi, coming from the capsule, tend to pass together (without entering into any communication with the grey nuclei of the central masses), directly into the formation of the corona radiata. Near their origin, that is to say, in the lower part of the capsule, these fasciculi being, in a way, drawn close together in a narrow passage, could be much injured at a single blow, by even a very small lesion, and the result would be a well marked anæsthesia. We know that higher up, at the level of the foot of the corona radiata, a lesion of the same extent, ought, on account of the divergence of the fibres, to produce much less striking effects. And that is really the case.

FIG. 17.



Transverse section of a dog's brain 1·5th inch in front of the optic commissure. SS, the two caudate nuclei of the corpora striate; L, Lenticular nucleus; PP, Penduncular expansion (internal capsule); Ch, Optic commissure; x, Section of the internal capsule (anterior or lenticulo-striate region), producing hemiplegia on the opposite side of the body without anæsthesia; R, Veyssières spring stilette for dividing the internal capsule.

FIG. 18.



Transverse section of a dog's brain at the level of the mamillary tubercles; OO, Optic thalami; SS, Caudate nuclei; PP, Internal capsule, posterior or lenticulo-optic region; AA, Cornua of Ammon; x, Section of the posterior or lenticulo-optic part of the capsule determining hemi-anæsthesia; LL, Lenticular nuc'ei.

There are many undoubted examples of hemi-anæsthesia, occurring with by no means deep lesions of the foot of the corona radiata.

We should now be able to decide whether extensive lesions of the occipital lobes, and particuliarly of their grey cortex, would bring about crossed hemi-anæsthesia. But the observations on this point are not sufficiently explicit, and the question must remain in suspense. But we must bear in mind, meanwhile, that the fasciculi comprising the hinder part of the internal capsule, and their direct emana-

tions, must not be regarded as a centre of sensitive and sensory impressions.

They can only be looked upon as a passage way, a cross way where the centripetal fibres, with which we are concerned are all to be found before radiating towards the surface of the brain.

SOME OBSERVATIONS ON EXTRA-UTERINE FŒTATION. (a)

By Richard Dancer Purefoy, M.B. Dub. Univ.,
Obstetric Physician to the Adelaide Hospital, Assistant Physician to the Rotundo Hospital.

In March, 1873, the patient, a strong, healthy, married woman, who had previously enjoyed good health and regular menstruation, believed herself to be pregnant, as menstruation ceased and abdominal enlargement ensued, which, however, was most marked on the left side. Early in May, and again in June, two severe attacks of pain were experienced, passing down the back of the thigh, in the track of the sciatic nerve. Early in August a third attack of pain took place, and lasted for three weeks, very intense in character, attended with much bearing down, constant yellow discharge per vaginam, frequent micturition, and constipation. During the two months preceding this, marked enlargement of the tumour had taken place, but, at the same time, the patient had lost flesh, and suffered much from thirst and swelling of the feet.

Shortly after this third attack, just described, and about five months from the date of the last menstruation, a vaginal examination was made. The abdomen was swollen, and the left hypogastric region occupied by a hard, movable tumour, which reached an inch above the umbilicus, and seemed to be connected with the uterus, though it lay quite to the left of the sound, when in the uterine cavity. At this time the vaginal discharge has ceased, and the patient complained only of severe pain in the side, until the following November, when an attack simulating diarrhœa came on, and at the same time fœtal bones, of which I have obtained one, began to escape per vaginam—and this continued for more than a year. At the present date, that is, nearly four years from the occurrence just described, the patient enjoys excellent health, and the only local evidence of what she has undergone is a small cicatrix in the vagina, at the left side of the cervix, and some lateral deflection of the uterus to the same side. Since observations on the lower animals and on man have demonstrated the presence of spermatozoa on the ovaries and in the whole pelvic portion of the abdominal cavity, we must admit the possibility of extra-uterine fœtation, and considering the numerous circumstances which, singly, or combined, may interfere with the normal passage of the ovum into the uterus, we may rather be surprised that cases of it are so rare.

Examples of tubal pregnancy occur when the ovum is arrested in the Fallopian tube, from some of the diseased conditions just mentioned, and sometimes from the presence of a polypus at the uterine extremity of the tube, as in Beck's case, or as in the very rare case mentioned by Hässfinther; an ovum which has normally entered the uterine cavity may pass thence into a Fallopian tube, and there develop.

Mr. Holmes, in the 43rd vol. of "Medico-Chirurgical Transactions," gives an account of a dissection of a recent case of tubal prenancy, in which he found a third membrane surrounding the ovum, distinct from the chorion and amnion, separable into two layers, and not forming part of the wall of the tube. The distension of the tube, due to the growth of the ovum, generally obliterates both its extremities, particularly that corresponding to the uterus, and its muscular fibres are so forced apart that the fœtal sac consists only of peritonæum and tubal mucous membrane.

The most frequent termination of tubal pregnancy is in rupture of the sac before the fifth month; generally at its thinnest part, but sometimes at the placental insertion, and death, either from profuse internal hæmorrhage at the time, or from the consequent peritonitis. However, after its escape into the abdominal cavity the ovum may be encapsuled, and if at an early period of development it may, to a great extent, be re-absorbed; or, if the embryo be older, it may undergo the changes which will be mentioned when speaking of abdominal pregnancy. Undoubtedly the most favourable termination of tubal pregnancy is when the embryo perishes early, and recovery ensues without any rupture. Various measures have been taken to secure this end. Dr. Bachetti subjected the tumour in a case under his care to the action of the continuous current, with a favourable result, and Greenhalgh, of London, and Martin, of Berlin, were equally successful by merely puncturing the tumour through the roof of the vagina. With regard to diagnosis, Schroeler has well said that it is generally easy in the first months to make sure of an extra-uterine tumour, while the diagnosis of a pregnancy is frequently involved in difficulty; at a later period pregnancy can easily be diagnosed, but to show that the fœtus is outside the uterus may be very difficult. In the first place it is to be observed that all the usual sympathetic disturbances of pregnancy exist—the breasts enlarge, the areolæ darken, and morning sickness is present. Menstruation is arrested, but there are often irregular hæmorrhages especially before rupture takes place. Barnes attributes these to partial detachment of the chorion villi, produced by the ovum growing out of proportion to the tube in which it is contained, and that they are thus exactly similar in their mode of occurrence to the hæmorrhages which occur in cases of placenta prævia in the early months. If, under these circumstances, a careful bi-manual examination reveals the presence of an elastic, sensitive tumour on one side of the uterus, and that the latter is moderately enlarged, the case is probably one of extra-uterine pregnancy; the use of the uterine sound in very skilful hands may demonstrate that the uterus is empty, and this will also help us. We may be quite certain if hard and movable parts can be felt in the extra-uterine tumour, and if the fluid obtained from it by puncture have the usual characters of liquor amnii. When by these various means of examination a satisfactory diagnosis can be arrived at, and the sac is accessible from the vagina, rectum, or abdominal walls, we are justified in puncturing it with a fine trocar, allowing the liquor amnii to drain off, and this can generally be done most readily through the vagina. The fœtus then dies, and, according to the time of its development, is either re-absorbed or converted into a lithopædion. Dr. Bachetti has successfully used the continuous current to obtain the same result. Recently Dr. Thomas, of New York, opened the cyst through the vagina by a platinum knife, heated by a galvano-caustic battery, and, through the opening thus obtained, removed the fœtus. In attempting the removal of the placenta violent hæmorrhage ensued, requiring the use of an astringent injection to stop it; the patient made a good recovery.

More frequently our aid is sought when rupture has taken place, and our efforts must then be directed to stop the hæmorrhage, a matter of no little difficulty. Ice applied to the abdomen, and, if possible, compression of the abdominal aorta, are the most efficacious means. If assistance be at hand immediately after the rupture, and if the ovum be of large size, perhaps the most successful treatment would be the Cæsarean section in order to stop the hæmorrhage, remove the fœtus, and, if possible, the whole sac which contains it. It is supposed by Bernütz, and his opinion is shared by Barnes, that rupture which does not prove fatal is probably not very rare in the first few days of extra-uterine gestation, and that it is not an uncommon cause of certain forms of pelvic hæmatocele.

In the "Obstetrical Transactions" for the year 1867, Braxton Hicks describes a case of interstitial pregnancy, which for some time enlarged equally towards the peri-

(a) Abstract of a paper read before the Dublin Obstetrical Society. The debate will be found at page 227.

toneal and uterine cavities, but finally burst into the latter, permitting the escape of the fœtus, and simulating an ordinary abortion; the sac then compressing, the placenta still retained in it, a large vein just beneath the peritoneum burst and produced fatal hæmorrhage. The difference between interstitial and simple tubal pregnancy can be shown in the dead body by the relation which the round ligament bears to the sac containing the fœtus. In the interstitial form the ligament passes external to the sac, and in simple tubal pregnancy between the sac and the uterus. A distinction between this and gestation in a perfect or rudimentary horn of the uterus offers great difficulties, since the relation of the round ligament to the sac of the fœtus is the same in both, and the thickness of the septum between the sac and uterus proper differs only in degree, though it is generally less in the interstitial form. Ovario-tubal pregnancy occurs when the ovary and tube both take part in the formation of the fœtal sac.

Dr. Hayden, of London, in the year 1862, brought before the Obstetrical Society the case of a young woman who died after a few hours' illness from rupture of the sac of a tubal gestation; the *post-mortem* examination, by Dr. Smith and Dr. Hicks, showed that some time before the patient had conceived extra-uterine, the fœtus being attached to the fimbriated extremity of the Fallopian tube in such a way as not to prevent conception, that the fœtus died about the second month of pregnancy, still enclosed in its ovular structures; that at a later period she again conceived extra-uterine, but the ovum now descended to the middle of the tube, where it became arrested, lived about three months, and then died; three months after which the sac burst and death ensued.

A case remarkably similar in many particulars to this was recorded some years ago by Mr. Tufnell. A patient in the fourth month of pregnancy was seized after a long walk with violent abdominal pain and prostration, followed by death in twenty-four hours. At the *post-mortem* examination the abdomen was found to contain a large quantity of fluid blood, in which a fœtus one inch in length was floating; a rent in the right tube disclosed a cyst from which the fœtus had escaped. In the uterus was found a healthy male fœtus proportionate to the date of conception.

The diagnosis of abdominal pregnancy is beset with difficulties. Along with the general signs of pregnancy, there is generally metrorrhagia; and this, together with repeated attacks of abdominal pain, due, probably, to intercurrent attacks of peritonitis, occurs more frequently, than in tubal gestation. The abdominal enlargement is generally greater transversely, and the fœtus can be felt more distinctly than in normal pregnancy. Per vaginam, the cervix may be felt displaced by the pressure of the cyst, or fixed by perimetric adhesions. Either of these, Dr. Playfair thinks, is of great diagnostic value. We should certainly have recourse to the use of the uterine sound before undertaking any operative interference. In his paper on this subject Dr. Lawson Tait says there are two points invariably to be noticed in extra-uterine gestation which had gone past the period—viz., a show during the false labour, and subsequent diminution in the size of the abdomen, due to the absorption of the liquor amnii. Before the death of the child extra-uterine fœtation may be mistaken for displacement of the normally pregnant uterus, during the early months, for pregnancy complicated with fibro-myoma or cystic disease of the uterus, and more rarely for pregnancy of one half of a double uterus. Indeed in this latter case, as Kussmaul has shown, a differential diagnosis may be quite impossible before death, and very difficult even after it. After the death of the child the diagnosis is more difficult, and the case might be confounded with pelvic hæmatocele and ovarian tumour, especially dermoid cysts, cancer, fibro-cystic disease of the uterus, hydatids of the uterus, and phantom pregnancy, with hernia.

Regarding the treatment of abdominal gestation, there is still some difference of opinion, though it is mostly admitted that no active measures should be adopted till the full term of development is reached, because there is not the same imminent risk of death from rupture as in the tubal form; and even if the destruction of the fœtus could be secured there would still be formidable dangers from subsequent attempts at elimination or internal hæmorrhage.

If menacing incidents occur when the gestation is so far advanced, that a living child may be expected, or if the case has gone on to term and the child be alive, we are strongly advised by the best authorities to perform the Cæsarean section, as we may thereby save the child, and the risk to the mother is scarcely greater than in waiting. An incision large enough to extract the fœtus may be made in the linea alba, and should there be no adhesions, the walls of the cyst should be stiched to the margins of the incisions to cut it off as much as possible from the peritoneal cavity. No attempt should be made to remove the placenta unless it be quite loose, as otherwise uncontrollable hæmorrhage, owing to the nature of its position, is likely to occur. The cyst should be carefully washed out with some antiseptic fluid. Schrœder advises us, when possible, to remove the whole sac, with the fœtus and placenta.

If the child has died towards the end of pregnancy the treatment is merely symptomatic. Any efforts of nature to eliminate the foreign body are to be assisted by incisions, and the removal of pieces of the fœtus from the abdominal walls, the vagina, or the rectum. The more extensive the adhesions of the sac to the abdominal walls, the more safely can incisions be made to remove its contents; and their formation may be favoured, as in Simon's method of treating hydatid cysts of the liver, by pushing in two trocars, and by dividing the bridge between them, thus causing a larger opening.

NOTES ON THE TREATMENT OF GONORRHŒA AND SOME OTHER DISCHARGES AS THEY OCCUR IN THE MALE, BUT PARTICULARLY AS MET WITH IN THE FEMALE.

By G. de Gorrequer Griffith, L.R.C.P., M.R.C.S., &c.,

Senior Physician to the Hospital for Women and Children; Physician to St. Saviour's Maternity; late Resident Surgeon to the Lock Hospital.

Owing to the kind courtesy of Mr. Lane, Mr. Buxton Shillitoe, Mr. Coulson, and the late Mr. Gascoyen, I had abundant opportunities of seeing an immense number of cases of these affections while I served as resident, or house surgeon, at the Lock Hospital under those gentlemen; and it was, while labouring in *statu pupillari* under these distinguished surgeons, that I amassed rich stores of knowledge, which have since proved of valuable service to very many patients. It was during those student days at the Lock that it first occurred to me to employ the very simple remedy I now invariably adopt in the case of gonorrhœa and any doubtful discharge in the female. I myself believe that the most efficacious means of stopping gonorrhœa and gonorrhœal discharge, and its evil concomitants, as they are found in the male or female, is the balsam of copaiba and opium, with a jalap purge as an adjuvant when required.

I have seen, and known to be employed, various injections into the vagina; and at one time I used to resort to them in almost every case; but experience has taught me their comparative inutility, nay, more, their sometimes positive harmfulness, either because of the medicinal agents themselves, or because of the manner in which they, in the form of injections, are administered. I am now speaking in reference to women.

How few patients amongst men also, know how to give themselves injections properly; and, consequently, from neglect of the simplest, I had almost said, the plainest

common-sense rules of treatment, not alone do not get better, but positively make themselves worse, teasing the tender, irritable, and inflamed urethra by the nozzle of the syringe, or fretting it by futilely essaying to injaculate the lotion which may have been prescribed. If we order injections, it would be well to see our patient use them a few times in order to satisfy ourselves of his ability.

Our first care should be to make him pass water, that by this act he may wash away any discharge lying in the urethra, as well as to empty the bladder and prevent the need to do so again for some hours, as long, indeed, as the urine can, with convenience and without any discomfort, be retained. In the second place, with the aid of a syringe, the urethra should be well washed out—several times—with hot water; this done, the injection may be thrown into the pipe. I am particular in enjoining that the urethra be well cleansed by the patient first passing water, and then using the syringe with warm water, because I believe that the specific inflammation may be carried back to the prostatic and seminal ducts, and, therefore, much farther back than it was originally, inoculation being effected by the retroversion of the gonorrhœal matter when the injection is used.

The penis, whenever we wish to inject, either the hot water or the medicaments, had best be straightened, that is, drawn upwards towards the abdomen; the nozzle of the syringe being oiled, or larded, should be gently introduced, and, when well in, the head of the penis must be firmly gripped around it by the thumb and forefinger of the left hand which thus also steadies the entire instrument, while the right is at liberty to force down the piston. Escape of the injection by regurgitation from the urethra is in this way prevented, and the nozzle of the syringe being embraced in the manner I have just described, the fluid we mean to use must be injaculated with such force as to ensure the laving of the entire of the inflamed surface; no fear need be entertained of injuring or entering the bladder, as it is quite out of reach, and hence out of danger.

The syringe should be large enough to contain sufficient to distend the urethra, lest the gonorrhœal discharge may lie undisturbed in any depression, plicæ or folds of the mucous membrane, and act as a focus for keeping up the specific inflammation; moreover, by this gentle distension, certainty is made, that all the membrane is bathed with the injection. The latter being in, the nozzle is gently withdrawn by the right hand, the left still holding the penis, so as to retain the injection in urethram, where it should be kept at least five minutes before it is allowed to flow away, syringeful after syringeful being thrown in as one quantity passes away, till the process has been repeated three or four times. The nozzle of the syringe should be long enough to enter the urethra to the extent of an inch, else, in many instances, when the patient is injecting, the very force he employs will tend to separate the penis and instrument; or he himself will involuntarily shrink back from the latter, just as the first few drops come into contact with the orifice of the canal; and consequently if the nozzle be not sufficiently long, the injection will be squirted outside over the hand and fingers, and not at all into the passage.

I invariably give instructions that the bladder be not evacuated for some hours after the last syringeful of lotion has been used, in order that the residue of the latter may lie undisturbed in its contact with the mucous lining; so that I have a medicinal and mechanical effect produced at the same time. Let the injection be repeated after every call of nature.

If a patient come for advice in the acute stage of the attack, it is advisable to allow the penis several times a day to hang in a vessel of hot water for ten or fifteen minutes at a time, the temperature of the water being kept up to the degree of heat which the patient will find the penis can tolerate.

Balsam must be administered internally. I prefer the capsules, giving at the same time the liquor kali or potassæ freely, and demulcents such as barley water, while I caution against stimulants and irritants in the words I learned from my great teachers:—"You must not drink a drop of beer, wine, spirits, shrub or spruce;" and you must not touch anything of the kind *for at least a full fortnight* from the day you see the last appearance of any discharge from the penis. I also recommend the treatment, general and local (if the latter has been already used) to be continued, during this interval.

Indeed, it is invariably right to press these two points on our patients, because by relaxing the injunctions, the whole affection may be reproduced.

This is the rule of practice in the treatment of males, from which I never deviate; but in the case of females, such an embargo is not necessary.

Opium and belladonna, or opium, belladonna, and aconite, in the form of suppositories are excellent counter-agents, not only in relieving pain and chordee when they occur, but also in checking the discharge. In my own mind, I have no doubt these drugs materially help to dry up the flow.

I recommend for use a glass syringe with the nozzle at right angles with the cylinder, attending to the precaution that the latter is large enough to hold sufficient to dilate the urethra in the manner I have described.

An elastic bottle, with glass or prepared vulcanite, or ivory nozzle, may be substituted for the syringe I have above named, and will allow of pretty good force in throwing up the injection; but it is open to the objection that the bottle part may, by the carelessness of the patient, or by unavoidable accident, suddenly expand, not only withdrawing the fluid which may have been injected into the urethra, but also catching in the aperture of the nozzle a piece of the mucous membrane lining the urethra, and wounding it, or producing some abrasion.

When the glass syringe is the one we have selected for use, we should see that the piston acts easily, running up and down readily; yet, having the buffer part fitting the tube well, lest, when the injection be attempted to be used, it should run back over the buffer into the cylinder, none, or scarcely any, entering the urethra.

Many times I used to have patients come to me and say—"O, Doctor, the injection doesn't do me a bit of good." Knowing that it ought, I have asked them to let me see how they used it, and found some had such defective syringes, that when the piston was shoved down, all, or nearly all, the lotion flowed back over the buffer into the cylinder, and some would be squirted out through the aperture in the cork, which is at the opposite end of the cylinder from the nozzle, and through which the rod of the piston travels; or else, that the tip or point of the instrument was hardly inserted into the urethra, and, therefore, no injection was really used, the major part being wasted, only a few drops being intromitted, and these few not passing any distance—scarcely beyond the very orifice.

In many of these cases I have myself used the medicament with the patient once a day, or three times a week, and with very marked improvement at each sitting, and a comparatively speedy cure.

As a topical remedy I prefer an alkaline injection, having balsam suspended in it, or sometimes even the pure balsam itself, and, in obstinate cases, I have found nothing better than the following plan:—

Make your patient empty the bladder, then rest for a few moments; again have the bladder relieved of its contents; next pass down as full-sized a catheter—silver or gum-elastic—as your patient's urethra will admit, having previously charged the instrument with balsam, and smeared its surface with the same. When the eyes of the catheter are in the bladder withdraw your thumb or the leather-covered plug from the opening at the handle end of the instrument. In this way the balsam flows into the bladder being released from the interior of the catheter which is then withdrawn. The patient again makes the attempt to pass water, the medicament will be expelled, and in its transit the urethra will be coated with it more or less com-

pletely. Indeed, I have often injected the balsam through the catheter into the bladder, and making the patient empty the latter as speedily as possible, have thus laved the entire urethra with the unctuous remedy.

This plan I have found to be specially advantageous, when balsam cannot be taken by the mouth, or when the discharge is chronic, or even very chronic, and also when some abrasion has taken place in the urethra, or when a bare, granular surface, or even ulceration exists.

Another point to which we should pay particular attention is the cleansing of the instruments thoroughly and immediately after use. Many times have I known a discharge to be reproduced apparently by the introduction of an instrument not perfectly cleaned; indeed, I have seen cases where, in a person free from it, gonorrhœa has been lighted up by the use of a catheter which had been previously employed during the cure of this affection for drawing off the water, and then, having been imperfectly cleansed, put by for some time. A patient may likewise inoculate himself, and produce a gonorrhœa, although previously having no symptom of it, nor, indeed, having exposed himself in any way to catch it in sensual congress, by the use of an instrument which he had before employed, and which he had laid aside without having carefully adopted the cleansing precautions I have pointed out.

The same care is to be used in the case of females, with whom we may use the speculum, the uterine dressing forceps, or any appliance which may be brought into contact with the discharge. I consider that it is well to put aside a set of instruments for such purposes, to reserve them only for this particular use, and immediately after using them to soak them in a disinfectant, and subsequently, to have them thoroughly cleansed.

Here, in parenthesis, I would say similar preventive measures should be invariably taken after examining cancer or syphilitic cases.

(To be continued.)

CASES IN PRACTICE.

(Reported by JOHN W. MARTIN, M.D., the Grange, Dronfield, near Sheffield.)

CASE XX.—*Extreme Anæmia—Hæmorrhage from Womb and Bowel—Irregular Cardiac Action—Amblyopia—Deafness, &c., &c.—Treatment—Recovery.*

JANUARY 6th, 1877.—I was asked to see Mrs. M., æt. 34, residing at the village of Dore. The symptoms of prostration and the tendency to prolonged syncope were so alarming, her husband, who came for me, feared that I should not find her alive. Upon arrival I found her lying in bed in a state of extreme prostration. Decubitus dorsal; complexion pale and bloodless, presenting a markedly waxy appearance. The expression of her face was one of great anxiety and weakness. She was quite conscious of her dangerous condition, and able to answer clearly all questions put to her.

The chief symptoms she complained of were, headache, and a violent "thumping" sensation in the head; singing in the ears; impairment of vision, and of the sense of hearing; violent palpitation and dyspnœa; a continuous, pale, watery hæmorrhagic drain from both bowels and vagina.

There was a very heavy earthy odour from the skin.

Her lips, gums, and tongue were almost white; the latter firm, well protruded, and lightly furred. She suffered from complete loss of appetite. Upon taking food in any quantity, felt nauseated, and at times vomited. Troubled greatly with flatulence, both in the stomach and bowels. Hepatic dulness, measured six inches in the vertical diameter; the lower edge of the liver protruded 1½ inches below the cartilages of the false ribs. I failed to detect any splenic enlargement. Bowels acted irregularly, sometimes constipated, at other times moved consecutively for two or three days. She was much troubled with piles. Area of cardiac dulness enlarged, measuring five inches in the vertical direction, from the lower border of the third rib in the left side, and 4½ inches in the horizontal diameter, measuring from the middle of the sternum, opposite the articulation of the fifth rib. Area of impulse diffused over the area of dulness, presenting the appearance of undulation at each stroke of the heart; the force of impulse was much weaker than what might be expected as the standard of health. Heart's action regularly irregular, every second beat resembling a double knock, every seventh *couple* of beats ended in a triple beat. The normal heart sounds almost lost, being masked by loud, low-pitched murmurs, heard over the mitral aortic tricuspid and pulmonary valves; murmurs of the same character were heard in the carotids.

Pulse 76, also regularly irregular; it was very weak and compressible. Violent pulsations noticeable in the veins of the neck, closely following the irregularity of the heart's action; so much so was this the case, that they might be described as cardiographic. She complained of a severe pain which seemed to pass from the ensiform cartilage back to the middle of the dorsal region of the spine.

Respiration was chiefly carried on by means of the voluntary muscles. There was strongly-marked dyspnœa. Number of respirations per minute reached the high rate of fifty; they were very short, shallow, and gasping in character. Percussion and auscultation presented nothing unusual; if anything, the percussion note was clearer than normal. Felt a strong inclination to sleep.

Her medical history and that of her family, as far as I could learn, may be briefly stated as follows:—She has been twelve years married, during which period she has had three children; the last was born Sept. 21st, 1876. After the birth of the first child she had an almost fatal attack of what she describes as milk fever; as far as I can learn, this attack must have been one of phlegmasia dolens, affecting the crural and femoral vein of the right leg and the superficial epigastric of the same side. The right leg remains larger than the left, and at the middle third of the calf is the seat of a large varicose ulcer, which has never shown any disposition to heal. The right superficial epigastric vein is swollen to the size of a man's little finger, of moderate thickness, and is quite hard to the touch. During her last pregnancy she was very low and weak.

There had been nothing unusual about her confinement; it was short in duration, and unattended by post-partum hæmorrhage. Notwithstanding her low, weak condition, she insisted (although warned against doing so) upon nursing her child, which was an unusually large, strong, healthy little fellow, and continued doing so up to the date of my seeing her. Even then it was with the greatest difficulty I induced her to desist. She suffered from an over-abundant secretion of milk; in her own words, "Everything I take seems to turn to milk." On first seeing her I found the breasts very large, and a free, continuous drain of milk oozing from the nipples. Previous to this last pregnancy she had been a rather large, corpulent woman; at the present time she is quite the opposite, being very thin and spare.

One of her sisters, middle-aged, who for over eighteen years had no child, was confined of a healthy boy twelve months ago. She also suffered from a severe attack of phlegmasia dolens, which has left her right leg much larger than her left. Previous to the birth of her last child she had been of a spare habit of body; since then she has become a large, corpulent woman, greatly troubled with severe bilious attacks of headache and vomiting, but otherwise healthy.

The father and mother both died at the age of sixty-four years. The former was a very hard drinker, and died from the effects of traumatic gangrene of the leg, for the relief of which he refused to allow amputation to be performed.

The latter was affected with chronic rheumatism, and died from the effects of organic disease of the heart.

The family generally was naturally a strong-constitutioned one. There were ten of them altogether, eight

now living. Two died, a brother and sister; the brother from the effects of intemperance, rheumatism, and heart disease, the sister from the effects of heart disease. From birth the latter was imperfectly developed—in fact, she was a dwarf. I note these facts, merely as such, drawing no inference from them.

It would be too tedious to record the daily progress of the case. A brief *résumé* of the treatment adopted will be all that is necessary.

It consisted in keeping the patient perfectly quiet in the horizontal position, with the head as low as possible; weaning the child; sinapisms (consisting of one tablespoonful of mustard to ten of flour) over the heart, where they were allowed to remain for a couple of hours; administration of support, in the shape of very strong beef-tea; eggs broken up with a little brandy, sugar, and warm milk; milk, jelly, champagne (which was not borne well, owing to the flatulence induced, even when not in a state of effervescence), and brandy. These were given in small and frequently-repeated doses, varying from a teaspoonful to a tablespoonful, at shorter or longer intervals, as the case at the time seemed to require. The brandy was given in dessert-spoonful doses every second hour, except when syncope was imminent, when it was administered more freely. Teaspoonful doses of pepsine wine were also ordered, with good effect. At the outset, for the purpose of checking the hæmorrhagic drain, I placed her upon

℞. Acid sulph., dil., ℥ijss.
Liq. ergotæ, ℥iij.
Tr. opii, ℥jss.
Syrupi, ℥j.
Aqua, ad ℥viij. ℳ.

Two tablespoonsful to be taken every fourth hour.

The purpose for which the foregoing mixture was ordered being accomplished, I changed it for

℞. Ferri amm. cit., ℥j.
Ammonia carb., ℈ij.
Tr. digitalis, ℥j.
Syrupi, ℥j.
Aqua, ad ℥viij. ℳ.

Two tablespoonsful to be taken every fourth hour.

After a time I omitted the carbonate of ammonia in the above mixture, substituting ℥ss. doses of the aromatic spirit of ammonia.

At the date of my last visit (Feb. 7th, 1877) the following was her condition:—She was able to be out of bed all day; walked about the house, and up and down the stairs, without any sense of fatigue or discomfort to her powers of breathing; lips and cheeks showed returning colour. Heart's action was strong and regular, having lost all traces of irregularity and intermission, Both sounds present; the *second* very distinct (in fact, greatly accentuated), the *first* still "buffed," and marked by a soft blowing murmur which was heard in its maximum intensity over the point of impulse, one-and-a-half inches to the right, and below the left nipple. The bruits at the base, and over the tricuspid valves, not so distinct as when formerly examined. Area of dulness much diminished. Pulse 76, strong, even, and firm. Vision quite restored. No longer complains of being deaf, but has a slight singing in her ears, especially in the right. Free from headache, and enjoys a good appetite for her meals. Menstruation re-established during the preceding two days, the flow being normal as to quantity and quality. She asserts that she now feels better and stronger than she has done for years.

The leading features of interest in the case are—the extreme anæmic condition present, the irregularity and weakness of the heart's action, the tendency to fatal attacks of syncope (one of these, left at the time, almost no hope of recovering her out of it), and the continuous hæmorrhagic drain that was flowing from the vagina and bowel. All things considered, there did not appear much reasonable hope of the patient's recovery; therefore it is the more satisfactory to be able to record the favourable termination of the case.

Transactions of Societies.

DUBLIN OBSTETRICAL SOCIETY.

THE fourth meeting of the Session was held on February 10th, Dr. DARBY, President, in the Chair.

Dr. PUREFOY read a paper on

EXTRA-UTERINE FŒTATION,

which will be found in abstract at page 223.

Dr. DENHAM reminded the Society that a year and a half ago he brought under their notice a very distressing case of extra-uterine fœtation. It was the woman's second child, and she was in excellent health and supposed herself to be four months pregnant. After a long walk she was about undressing when she felt suddenly weak and faint. A medical gentleman in the neighbourhood was sent for, and the faint passed away after the administration of some stimulants. At 5 o'clock the next morning, it however, returned, and he (Dr. Denham) was sent for, and on his arrival he found the patient extremely weak and exhausted. She was scarcely out of one faint when she was in another, and suffered for several hours in that way evidently from some internal hæmorrhage. There was no uterine hæmorrhage whatever, and there was nothing to lead them to suppose that her sufferings were occasioned by her pregnancy, although they knew from the history of the case that the lady was about four months pregnant. That turned out to be a case of extra-uterine fœtation in the Fallopian tubes. Unfortunately in a practical point of view those were cases in which their hands were tied up. They could do nothing. When he was Master of the Rotundo Hospital he had a very interesting case in which he removed all the bones of the head and several of the bones of the body per rectum. It was evident that a fœtus had died either in the body of the uterus, or that some adhesions had taken place between the extra-uterine fœtation and the rectum. The bones were very well formed, and he thought it was twelve or thirteen years between the time she considered she had conceived and the removal of the bones by the forceps. During all this time the poor woman was in wretched health and a constant discharge passed, sometimes from the vagina, and sometimes from the rectum. After the bones were removed her health recovered rapidly. He had another case in that hospital, in which a woman was delivered of a fine healthy child, but she had some tendency to hæmorrhage. The pupil in attendance on passing up his finger feared he had left a portion of the placenta behind, as he felt a hard body in the cervix uteri. On making an examination, he (Dr. Denham) discovered a hard bony substance imbedded in the walls of the cervix uteri. He then by means of a fine forceps drew out a foreign body, which proved to be a well-formed molar tooth with three prongs to it. His impression was that on some previous occasion the woman must have had some unnatural conception of which this tooth was the last remnant. That woman's recovery was perfect.

Dr. LOMBE ATTHILL (Master of the Rotundo Hospital) said the two points of interest in connection with the paper, were the question of diagnosis, and the question of whether they should interfere or not. The abdominal section was justiable under certain circumstances. When the fœtus arrived at the full time operative interference was justifiable, but when they proceeded in the earlier months he thought the operation *per vagina* was the proper one to attempt. The reason why he preferred the operation per vagina to the abdominal one was, that it was almost impossible in the latter to remove all that constituted the foreign body, for that was what the ovum was under such circumstances, placenta, membranes and so forth, what he might call the false uterus, because the ovum was completely enveloped in a cyst which for all intents and purposes they might look upon as a uterus. It was impossible to remove all that, and the result was that they had a portion left behind which was almost certain to decompose more or less. After alluding to the difficulty of diagnosis, Dr. Atthill concluded by saying that there was no doubt that many of these cases of extra-uterine fœtation had gone on for many years, and resulted after all in perfect recovery.

Dr. M'CLINTOCK had no experience of cases of extra-uterine fœtation, and thought he might rather congratulate himself

on that fact, but he should not boast. Dr. Purefoy had stated, he thought on the authority of Dr. Barnes, the probability that many of these cases of what had not been very accurately described as retro-uterine hematicine, better known as pelvic hematicine, owed their origin of extra-uterine fœtation from the rupture of the cyst causing extravasation of blood into the peritoneum. He (Dr. M'Clintock) had seen at least two cases of Pelvic hematicine, and the history of the cases was that the time of the occurrence, and the formation of the tumour and the hæmorrhage were clearly while in early pregnancy. Each patient had two or three children previously, and were living at the time with their husbands, and apparently had passed two or three periods without seeing their wonted menses, and had themselves come to the conclusion that without any doubt they had conceived, when suddenly they were attacked with pain, prostration, and sickness, and a tumour rapidly formed either behind or beside the uterus. He was satisfied that in certainly two of the few cases of pelvic hematicine that he had seen, the conviction was strong in his mind, that they were really in the first instance examples of some form of extra-uterine fœtation and that at an early period, probably a month or six weeks after their impregnation. The cyst burst and allowed an extravasation of blood into peritonæum, which blood was discharged in both cases by the rectum in large quantity, and the patients recovered. He thought that was a very interesting pathological point in connection with extra-uterine fœtation, as bearing upon the cause and development of another disease of a very important and interesting kind, pelvic hematicine.

Dr. PUREFOY said there were a few cases on record in which extra-uterine fœtation occurred, or rather was believed to have occurred, in connection with pelvic hematicine, and there was the possibility that in the earlier months it might be mistaken for pelvic hematicine.

Dr. DENHAM exhibited a large uterine polypus. The patient would not submit for sometime to a vaginal examination, and the case had for sometime to be treated as one of ordinary uterine hæmorrhage. When the patient at last yielded, a very large tumour was discovered firmly impacted in the vagina. There was very great difficulty, indeed, experienced in removing it. The wire was twice passed round the neck of the tumour, and it was eventually detached, Dr. More Madden's small forceps were passed round the the tumour, and with the vulsellum in the one hand and the forceps in the other, the tumour was got down into the perinæum. They were obliged to slit the perinæum, and they eventually got the tumour away with very great force. There was serious hæmorrhage after the operation, but the patient was now progressing favourably.

Dr. LOMBE ATTHILL said the case was interesting in this—that in the great majority of cases of intra-uterine polypi, which they extruded from the uterus, the hæmorrhage ceased to a great extent after the expulsion. In the case just related, that was not so. He had removed a polypus nearly as large as that now shown, and the symptoms in the case were that the patient used to suffer from intense leucorrhœa. There was no hæmorrhage, and menstruation was normal.

The CHAIRMAN announced that the result of the ballot was that Dr. Marion Sims had been unanimously elected a member of the Society.

In the course of a discussion on a paper by Dr. Finucane on

ERYSIPELATOUS METRITIS,

Dr. ATTHILL knew of the case of a woman who had been recently confined, and when he went to visit her he found one of her children lying in bed beside her suffering from scarlatina. Well, the child went through the disease, and another of the children got it, but the mother never got a symptom of it, and went on satisfactorily and made a perfect recovery. He had never known a case of scarlatina to be carried to a puerperal patient.

Dr. MORE MADDEN thought it would be a most hazardous doctrine to go forth that scarlatina was not a very dangerous disease to a parturient woman. If the doctrine became generally acted upon, medical men would be free to attend a woman in labour at the same time as they might be attending a case of scarlatina. Dr. Atthill, whose experience was wider than his (Dr. More Madden's), had never seen a case of scarlatina producing puerperal fever. He (Dr. More Madden) had seen such an instance, and he regretted he had seen it. He knew of a lady who could not be prevented from having a child recovering from scarlatina to sleep in a room with her, while lying after child-birth. Well, she got all the symptoms of typhoid-puerperal scarlatina, and she died, the disease being clearly communicated to her by the child sleeping in the room with her. He thought they must be very cautious before they allowed it to go forward that scarlatina was not likely to be communicated to a puerperal woman.

Dr. M'CLINTOCK said, it might be that a pregnant woman might not be very susceptible of scarlatina. That was one question. Another was the danger of scarlatina attacking a woman in child-birth, and it did not follow that because a parturient woman was exposed to the danger of scarlatina that she would take the disease; she might not do so, having had scarlatina previously. But he thought that scarlatina strongly predisposed to the production of puerperal fever, if it was not actually capable of producing it. With regard to the particular question of the danger arising from scarlatina when it attacked a parturient woman, he might make this statement—founded on long and painful experience—that when scarlatina was developed in a woman on the opening day of childbed, he looked upon it as a more dangerous disease than puerperal fever itself, and he would rather encounter puerperal fever than scarlatina. If scarlatina did not develope itself until after the third day there was a tolerable chance of the woman's recovery. When he said that, he wished also to make an observation *apropos* of this subject. He thought that at the present day the idea of the communicability and the transmissibility of contagious diseases by being carried by medical men and various vehicles, was enormously exaggerated. He thought it was ridiculous and absurd the extent to which this idea was now taken up by the public, and he believed that the medical men had just to thank themselves and their own profession for fostering and developing that idea. If a man was now known to have attended a case of puerperal fever he was in danger of being tabooed from practice. He (Dr. McClintock) saw a case of puerperal fever and the patient died. Two months after that the husband of another patient told him that he had been advised by some of his friends who had heard that he attended the fever case that there would be a certain amount of risk if he attended his (this gentleman's) wife. The gentleman's wife had not heard of the circumstance, and he (Dr. M'Clintock) told the gentleman that he had quite as much chance of conveying to his wife puerperal fever as the man in the moon. Whenever the question arose he (the speaker) made it a point to speak as strongly, or even more strongly, than he had this night, for if the idea went forth that it was possible that contagious diseases were as transmissible as is supposed, no person would be safe in going into a railway carriage or any public vehicle, and a public meeting, or place of worship, for they did not know who might be next them that had had scarlatina six weeks or two months before.

The PRESIDENT endorsed every word that Dr. M'Clintock had said.

Dr. DENHAM said, they had a great deal to learn on this subject. His opinion was that poisons were very often of much the same character—that was, that the same influence that would produce erysipelas or puerperal inflammation in one patient would produce scarlatina in another, and puerperal fever in a third. He had no doubt that poison was communicated before the labour took place at all. He differed from Dr. Atthill with respect to the nature of scarlatina. He (Dr. Denham) looked upon it as a most dangerous form of disease, and he must say that if scarlatina differed from other forms at all, he looked upon it as the only one that was communicable.

The Society shortly afterwards adjourned.

MEDICAL SOCIETY OF THE COLLEGE OF PHYSICIANS OF IRELAND.

A MEETING of this Society was held on Wednesday, March 7th, 1877, Dr. HENRY KENNEDY in the Chair.

Dr. DUFFEY read for Dr. Hayden, the President, some brief notes on

ANHIDROTICS,

a term by which, after Dr. Milner Fothergill, he designated medicinal agents capable of arresting or controlling excessive perspiration. Of these, the most efficacious in the sweating of phthisis was the pulv. ipecac. m. (Dover's powder) given in doses of 5 to 10 grs. in the course of the night, aided by cold drinks, ice, and sponging the surface with tepid vinegar

and water. The night-dress should be put on as warm as it can be borne. Next to Dover's powder in efficacy is phosphoric acid in 30 m. doses every fourth hour, and tinct. of belladonna in 15 to 30 m. doses. Profuse sweating is occasionally a very obstinate symptom in the convalescence of typhoid fever. For this, getting out of bed as early as the patient's strength will admit, is the best remedy.

Dr. FINNEY said, he had met cases in hospital practice of sweating in phthisis. He had for a long time, with few exceptions, used Dover's powder in conjunction with some other acids in one dose as recommended by Dr. Hudson, and he must say he had found it to answer in a great many cases exceeding well. He had employed not belladonna, but sulphate of atropia, and had given it in the form of a pill—half a grain of the sulphate of atropia and 40 grains of the sugar of milk carefully compounded and made into 40 pills; each pill, therefore, containing the 80th part of a grain of the sulphate of atropia. He found usually that one pill taken at bedtime checked and moderated the sweating. Two pills, one taken in the morning and the other at night nearly always stopped the perspiration. With reference to the treatment of local sweating, he might mention that Dr. Grimshaw had some time since brought under the notice of this Society an interesting case of local sweating of the feet due to wearing india-rubber goloshes made into slippers, and Dr. Grimshaw found that what answered best was the remedy that he (Dr. Finny) had been employing—sulphate of atropia in pill. He had employed sulphate of atropia in the cases of sweating in enteric fever, and he never found that it had any command over the sweating in enteric fever, while on the other hand, as he had stated, it had such a decided effect in phthisis in the softening stages.

Dr. M'SWINEY thought it would be found that they had all, from time to time, now tried one remedy and now another according to the fashion. He was in the habit of using in the early portion of his career diluted mineral acids in conjunction with a bitter effusion. Subsequently, the acetate of lead held a high repute, and was given in small doses as a pill, with apparently great advantage. Latterly, belladonna appeared to be almost universally relied upon, and in the little experience he had had of it it had had the effect, seemingly at least, of arresting the perspiration. The remedy which had been in his experience most comforting, had been the sponging of the body with diluted warm vinegar and water; and he had himself, in a case that he had watched with the deepest interest, seen the use of this application externally, apparently followed by considerable amelioration of the perspiration. The point of perspiration seemed to be confined to perspiration in phthisis at night. It was a question for consideration whether or not it was desirable to check the perspiration in phthisis. Practically, he thought they knew in the great majority of those cases, diarrhœa and perspiration alternated; he did not say it was so in every case, but it would appear that in a large number of cases of phthisis in the third stage that they had either diarrhœa or night perspiration, and if one should be disturbed by remedial means the other very generally took its place. On the whole, the tendency in his own idea was to say that it was not desirable to use any very energetic or decided or continuous means to totally arrest perspiration in phthisis in the third stage.

The CHAIRMAN said it appeared to him that the means of checking general perspiration turned on the general question of raising the state of the system for the time being. If it was a case in which cod-liver oil would agree, that from the moment it was given the perspirations were lessened, and it was astonishing the influence it had on the sweating. By a sort of starvation process he had been able to lessen the perspiration in phthisis. In the dress that the patient wore next the skin he thought cotton was superior to linen. Sponging was also a very valuable means of arresting the hæmorrhage. He agreed with Dr. M'Swiney as to the question of not checking the perspiration altogether, even if they were able to do it. He believed if it were done it was liable to bring on diarrhœa. The medicines he had used, independently of cod-liver oil, were occasionally Dover's powder and oxide of zinc combined with belladonna. Any medicine that acted powerfully on the nervous part of our frames had always seemed to him to arrest the perspiration. But there was one important point—these medicines lost their effect. He had not been able to give these remedies night after night to the end of a week in the dose he began with.

Dr. FINNEY, if he was not out of order, desired to observe with reference to what Dr. M'Swiney had stated as to the question of checking perspiration, that his (Dr. Finney's) experience in the cases in which he had used sulphate of atropia was, that he had not found diarrhœa to come on. He did not think that perspiration and diarrhœa were correlative. He had not found it necessary to continue the sulphate of atropia for any length of time, as in his own cases a few pills had been sufficient to check the perspiration for several weeks.

The Society shortly afterwards adjourned.

Medico-Parliamentary.

SURGEONS OF MILITIA.

In the House of Commons, on Thursday last, in answer to Colonel Mure, Mr. HARDY said the case of the surgeons of militia, who, as the hon. and gallant member stated, had been deprived of a portion of the income derived from their appointments by the clauses of the Royal Warrant of the 19th July, 1876, had received a good deal of consideration. He had been requested to receive a deputation, after Easter, from a medical body in the metropolis, who had taken up the subject, and he would give every possible attention to the statements they might make.

PUBLIC HEALTH (IRELAND) BILL.

Sir M. H. BEACH obtained leave to bring in a Bill to consolidate and amend the Acts relating to public health in Ireland. The bill was brought in and read a first time.

URBAN SANITARY BYE-LAWS.

In reply to Mr. Elliot, Mr. SCLATER-BOOTH stated that the code of urban sanitary bye-laws would be ready shortly after Easter.

PAUPER LUNATICS IN SCOTLAND.

On Friday, in reply to Mr. Bruen, the LORD ADVOCATE said that the total payment from Government grant towards the maintenance of pauper lunatics in Scotland was £59,483 in 1875. Of that amount £5,283 was contributed in aid of the wards of pauper lunatics in poorhouses. In 1876 the total grant for pauper lunatics was £62,637, of which £5,803 was contributed in aid of the lunatic wards. The Imperial contribution was half the cost of the maintenance of the lunatics, unless it exceeded 8s. a head per week, the utmost limit of the grant being 4s. In 1875 the average contribution per head from the Government grant was 3s. 6¾d.; and in 1876 it was 3s. 9d. In Scotland these licensed wards were under the direct control of the Board of Lunacy, and not of the authorities who had charge of the poor. They were inspected by the medical officers of the Lunacy Board, and no case was treated there without their certificate that it was a proper case for detention.

THE LUMLEIAN LECTURES AT THE ROYAL COLLEGE OF PHYSICIANS.

On Friday, Dr. George Johnson, M.D., F.R.S., gave the first of his lectures "On the Muscular Arterioles; their Structure and Functions in Health and in certain Morbid States."

Dr. Johnson commenced his lecture by drawing attention to the structure of the minute arteries, or arterioles, as they were now called, and to the fact that the middle coat of the small arteries was much more largely supplied with muscular fibre than that of the large blood-vessels, whose middle coat chiefly consisted of elastic tissue. In most of the small arteries three layers of muscular fibre cells were to be distinguished. In still smaller vessels only one layer was present, while in the smallest arterioles these muscular fibre cells were more or less scattered and broken up, until at last they disappear altogether in the capillaries. The next important point which had been

settled by modern investigations was, that the muscular coat of the arterioles was well supplied with sympathetic or ganglionic nerves. Minute ganglia, or ganglionic nerves, had now been recognised in the smallest arterioles, and were now generally known as the *vaso-motor nerves*, and although these nerves chiefly belonged to the sympathetic system, they were also connected in various ways with the cerebro-spinal nerves. Indeed, recent researches have shown that one of the principal vaso-motor centres is placed in the medulla oblongata. Now with respect to the function of these vaso-motor nerves, and the muscular coat which they supply, the researches of Claude Bernard, Brown-Séquard, and others, have thrown much light. On dividing the sympathetic nerve in the neck, the blood-vessels and small arteries of that side of the neck dilate, and a freer current of blood is at once established. On the other hand, on the application of galvanism to the sympathetic trunk, the minute arterioles contract, and the blood-stream is diminished. The action, therefore, of the muscular coat of the arterioles was to contract in response to certain impressions made upon the vaso-motor nerves, and in thus contracting, to regulate the supply of blood to the parts supplied by the vessels.

The chief object, however, of these lectures is to direct attention to the part played by the arterioles in certain morbid conditions; and Dr. Johnson introduced this subject by giving a description of what he considered to be the true phenomena of asphyxia, or, more properly speaking, apnœa. The condition of the cavities of the heart, found after death from apnœa, had been long ago described by Harvey, but a knowledge of the more early phenomena of asphyxia was the result of more recent experiment. The lecturer said he had had the opportunity of witnessing one of Dr. Rutherford's experiments, in which the first stage of apnœa was well demonstrated. Dr. Rutherford, after giving a dog a dose of curare poison, and having exposed its heart to view, kept up artificial respiration, while at the same time the tube of a hœmadynamometer was inserted into the proximate end of the divided carotid artery. Immediately on ceasing the artificial respiration, the left cavities of the heart were seen to increase in size until they bulged out into two globular bodies three or four times the size of the right cavities. At the same time the blood pressure in the systemic vessels was shown to be increased by the rise of the mercury in the instrument. Very shortly afterwards this distension of the left cavities subsided, as also did the blood pressure in the carotid artery, while on the other hand, the right cavities became engorged, and assumed the appearance they generally present after death. Dr. Johnson then combated the explanation that had been given of these phenomena by Dr. Reid, Prof. Draper, and other observers. The increased blood pressure and distension of the left cavities in the first instance, and the engorgement of the right cavities before death, were not due to an arrest of the systemic or pulmonary circulation in consequence of a disturbance in the relations which subsisted between the blood and the tissues, or the blood circulating in the lungs and the external atmosphere, *i.e.*, not to any *vis a fronte* action on the blood, but to the contraction of the arterioles in virtue of which they acted as "stop-cocks" to the passage of impure blood. This contracted state of the arterioles is immediately followed by increased blood pressure in the systemic blood vessels, the engorged state of the left cavities of the heart just mentioned, and increased tension of the radial pulse. This state, however, only lasts for a few seconds, when the arterioles become relaxed, and give a more free passage to the flow of blood through them, while at the same time the right cavities of the heart become distended in consequence of a contracted state of, and impediment to the circulation of the blood through the arterioles of the pulmonary artery. Dr. Johnson concluded his lecture by giving a similar explanation of the phenomena witnessed during the administration of nitrous oxide gas. At first the face was slightly flushed, the respirations quickened, and the tension of the radial pulse decidedly increased. This corresponded with the first stage of apnœa above described, and during which the left cavities of the heart were distended with blood. But immediately afterwards the arterioles become relaxed, the blood pressure in the systemic arteries ceases, the pulse becomes quick and feeble, the right heart and venous system engorged, and the countenance livid or cadaverous.

"SALUS POPULI SUPREMA LEX."

WEDNESDAY, MARCH 21, 1877.

VISCERAL SYPHILIS.—III.

IN our two previous articles on this subject we confined ourselves chiefly to an analysis of the more important facts to which the Pathological Society has recently attracted the attention of the profession. As we have already remarked there cannot be a second opinion as to the great importance of the discussion, which has just occupied three meetings of this Society, and of the investigation to which recent events may be said to have given a fresh impetus. The question as to what visceral lesions may be declared to be undoubtedly syphilitic, and the question as to the frequency or rarity of these lesions, when compared with the number of patients who contract syphilis, are certainly questions which deserve the serious attention of the profession, and on which modern pathology, with all the resources at our command, may well be expected to furnish us with exact information. As yet, however, the exhibition of morbid lesions, and the discussion to which they gave rise, are chiefly valuable, in so far as they suggest a more systematic investigation of the subject than it has hitherto received. We need scarcely remark that the recent discussions at the Pathological Society show how much we have yet to learn about visceral syphilis, and that this department of pathology is at present but in its infancy.

There was great discrepancy of opinion among those members who took a prominent part in the discussion. There appeared, indeed, some confusion, both of thought

and of facts, and to an extent that quite warranted the question of Dr. Wilson Fox as to whether they were not calling the same things by different names. The previous contraction of syphilis by some of the patients from whom the specimens were taken, was not very clearly demonstrated, nor were any facts brought forward to show that some of the lesions described were not to be found in persons who were free from syphilitic taint. Thus to begin with the *arteries;* it is not yet settled whether there is anything in the histological structure of the specimens exhibited that could be called specific and peculiar to syphilis. But this question is chiefly raised with respect to the lesions observed on the inner coat of the arteries. In the opinion of some they resembled atheroma, or were due to the organisation of a peripheral thrombus, or, as Dr. Greenfield contended, consisted of a peculiar growth from the endothelium, the interlaminar cells of the intima producing a vascular structure, corresponding to other syphilitic new growths. On the other hand, Dr. Gowers believed that Heubner, who had specially investigated the subject, did not recognise the specific character of the end-arterial changes. Heubner's description of syphilitic end-arteritis corresponded precisely with a disease of the arteries described by Wilks and Moxon, which the latter did not think was in any way connected with syphilis. Dr. Gowers thought that the observance of nodular thickening of the outer wall was of more significance than the endarterial changes, and we think that many will entertain the same opinion. For these are quite distinct from, and are seldom observed in connection with those atheromatous and other arterial changes that are seen in patients of advanced age, or who have never contracted syphilis. Dr. Greenfield, however, rested his opinion chiefly upon the gummatous characters of the endarterial changes, upon their vascularity, and their mode of origin. We are inclined to think that the question of the specific nature of these lesions must rest partly upon their analogy, in a histological point of view, to those other gummatous infiltrations which are generally admitted to be characteristic of visceral syphilis. Otherwise, we may be attributing to syphilis changes in the arteries which have been produced by very different causes, and which are common in patients who have never suffered from the slightest taint of that disease. We say "rest *partly*," because it is just probable that in some cases the chronic inflammatory changes in the arteries produced by the syphilitic virus, may not differ from those of a specific nature, the only difference being that the specific affection of the vessels occur at an age when inflammatory or degenerative changes of these parts, arising from other causes, are rarely observed.

The conclusion, therefore, we are at present warranted n drawing in respect to the arteries are— 1. That certain changes have been found in them affecting both the external and internal coats, occurring in patients who have contracted syphilis, and who have, moreover, died at a comparatively early age from disease which in most of the cases was the direct result of the arterial lesion. 2. That in many of the specimens examined the arterial lesion appeared to be of a gummatous nature, consisting of a small celled growth and a delicate fibrillar stroma, while in other instances the disease appeared to arise from a form of chronic interstitial arteritis that could not be regarded as of a specific nature. 3. That one great point for future consideration will be whether these changes which are now regarded as specific have been often observed in the bodies of patients who had undoubtedly never contracted this disease. Two or three such instances would throw much doubt upon the syphilitic nature of these lesions, while many such instances would upset the syphilitic theory altogether. 4. That it will also be desirable to collect a large number of cases where patients who have suffered from syphilis had prematurely died from cerebral or any other affection resulting from arterial disease, inasmuch as a large number of such instances would establish syphilis as an important factor in the causation of such disease, even were the new growth found to be identical in many cases with interstitial inflammation set up by other causes. 5. That, moreover, we should make the strictest inquiry into the medical history of a large number of patients suffering from aortic and other forms of aneurism, in order to see whether there is any foundation for the belief suggested by an observation of Dr. Mahomed, that aneurism occurs with much greater frequency in the subjects of syphilis than in non-syphilitics.

We should now pass on to the important questions raised in respect of syphilitic affection of the *lung*, but as their consideration would carry us far beyond the limits of this article, we must postpone our remarks for another week, when we hope to conclude the subject.

PRESCRIBING CHEMISTS IN ENGLAND.

THE commendable energy of the Medical Defence Association would seem from recent events to have driven the prescribing chemists to their wits' end for means to pursue their illegal trade as doctors, and these gentry are said to have decided upon the desperate remedy of an appeal to the Queen's Bench which—if taken—will, it is to be hoped, give the *coup de grace* to their unlawful proceedings, at least, until they can persuade Parliament to legalise their trade as prescribers.

The uniform success of the Medical Defence Association in its operations against the prescribing druggists had, some months since, led them to organise a trades' union for their own protection, and appeals from unfavourable decisions have been loudly threatened by the advocates of counter-practice. The contests in county courts culminated last week in the prosecution of a druggist named Shepperley at Nottingham. This gentleman was distinctly proved by his own evidence and that of patients to have examined the throat, questioned the applicants as to their ailments, advised them thereupon, prescribed medicines which they had not asked for, and the nature of which they did not know, and, finally, dispensed these medicines. He admitted that he had a screen in his shop behind which to interview and examine patients, and, in fact, out of his own mouth was admitted to have acted exactly as a medical man would have done under similar circumstances. As to whether he advised and prescribed he evinced an abnormal obtuseness of memory. Could not recollect! Might have done so! Was not sure! Thought it possible! &c., &c. The agent of the Medical Defence Association deposed as follows:—

Thomas Jolly Death said—I recollect going to Mr. Shepperley's shop. I said, "I want some medicine for relief of sore-throat, cold, and tightness of the chest." Mr. Shepperley then told me to face the light that he might look down my throat.

His Honour—Had you asked him to look at your throat?

Witness—No; he tapped me on the chest and said, "The tightness is there I suppose." I said, yes. He then said, "I think I can give you something, for there does not seem to be much amiss with you." He gave me some medicine to take internally, and I paid a shilling. I asked him how much, and his reply was, "One shilling, please. I think you'll find relief from that; if not, come again." That was all that passed. I did not take the medicine. I saw Mr. Shepperley again, but not in his shop. Mr. Shepperley said, "Being a nervous man I was at first alarmed, but I took counsel amongst my friends, and I have decided to go on prescribing." After attending a woman who had a bad leg, he said, "I have been prescribing, still prescribe, and mean to continue. If you go on we shall fight the question, and if you win we shall make an appeal."

His Honour—Then we may take it that he said he had prescribed, was prescribing, and should go on so doing.

Mr. Buszard (the Solicitor for the Chemists' Defence Association) contended that the defendant had done no more than was the practice before and since 1815, when the Apothecaries' Act passed, which was to prevent the chemists from visiting patients as doctors.

His Honour said, if defendant had done no more than a druggist usually does over the counter as a dispenser he could not find for plaintiffs. The real point at issue was that spoken to by Death, which was to some extent borne out by the evidence of Shepperley himself.

Mr. Buszard said then he must rely upon section 28, which gave chemists power to prepare, compound, dispense, and vend, and he contended Mr. Shepperley had done no more.

His Honour, however, reminded the learned counsel that the defendant had done considerably more than that.

Mr. Buszard continued that it was the practice before 1815 and since for chemists and druggists to prescribe for simple ailments, and the Act of that year was never intended to diminish that custom. The Act did not define what an apothecary was.

His Honour observed that the case went further than that, for, according to the evidence, a man went, complained of cold and tightness at the throat, and defendant prescribes for him as a medical man.

Mr. Buszard—It is a question as to the definition of the term dispensing.

His Honour said he should be quite contented if his definition of the term were overruled by the Supreme Court.

The prescribing druggist endeavoured to show that the existing system of counter-practice is no worse than that which was in vogue at the passing of the Apothecaries' Act, but the judge did not concur in the view that an illegality then (even if proved) would make a legality now, and gave a decree against the prescribing chemist. We earnestly hope that that gentleman will not be debarred from carrying his threat into effect and submitting the decision to a superior court. The case is fairly representative of counter-practice as it is carried on by hundreds of druggists in England, and the circumstances are as favourable to them as those of any case in which the Medical Defence Association is likely to interfere, and it is, therefore, a favourable chance for the chemists to test the feeling of the higher judges.

If the appeal be prosecuted we certainly look to the profession in England to do as much as the druggists are ready to do in finding money for the determination of the question. The Medical Defence Association is fighting the battle of the general practitioners, and fighting it with energy and skill. It may be forced to carry the campaign into an expensive arena, and it ought not to lose the engagement for want of ammunition or of the supplies which those it fights for are bound to bring to the scene of action. The medical profession does not desire to make profit out of a doubt as to the legality of counter-prescribing, but, on the contrary, feeling that the legality of medical practice ought to be decided and set at rest, is willing to abide by the opinion of the judges and the public on the matter. It will be for the benefit of all parties that the chemists shall establish their right to doctoring if they can, and, if not, that they shall be forced to confine themselves to such line of trade as their education entitles them to pursue.

Notes on Current Topics.

Death in the Pot.

THE stomach of the British public must be very discomforted, by hearing so much about the adulteration of food and drink, as revealed by public prosecutions almost daily in our police courts, and the perplexed *Paterfamilias* must turn in despair from one article of food to another, in the hope of finding something genuine. He likes white bread—'tis a compound of alum and potatoes; he loves a glass of fine pale sherry, and gets a mixture in which there is not a single drop of the juice of the grape; while his rich old port is a chemical formation, his whiskey-toddy an irritant acrid poison, and even a glass of good pure beer is unattainable.

Thus on all sides rings in his ears the cry, there is "death in the pot," "death in the bottle," and to still further perplex and worry him, sanitary science joins in the chorus, after his unavailing attempts to live on pure food, and avoid his concealed enemies, and depresses him by the cheering words, "there is death in the air you breathe;" poison germs come wafted to you on the fragrant breezes of your country house, foul emanations arise from the subsoil of your town residence, and scarlatina, typhoid fever, are carried home from your patent laundry company.

Insanity, it is said, is on the increase. Have we stumbled on its solution? Can we wonder at any ordinary individual, with perplexed brain and stomach upset from popular science reading, and attending popular lectures on diet and hygiene, becoming melancholy and depressed, until ultimately reason is dethroned? To a lover of green pickles—succulent and suggestive of cold beef and mutton—who has hitherto carefully avoided these tempting appetizers, there comes a faint *gleam* of *hope* that these viands are not poisonous or injurious.

But we must become serious. The most varied opinions have been put forth relative to the poisonous properties of the salts of copper, for the preservation of vegetables and fruits. Popular opinion has been decidedly against their use, not only in England, but in all civilised countries.

We learn from *Le Paris Médical*, that this subject has occupied the attention of the Academy of Science of Paris, and there has been considerable difference of opinion as to the injurious effects of the sulphate.

M. Pasteur is opposed to the artificial colouring of vegetables and fruits, as he believes that their use is hurtful, if continued for many days, owing to the absorption of copper into the system.

M. Vulpian, replying to Mr. Pasteur, denied that the poisonous effect of copper was proved, and asserted, that up to the present time, there had been no case of any accident caused by the absorption of this metal, or that it was possible to poison an animal with a moderate dose of this salt. Workers in copper were numerous in Paris and elsewhere, yet no accidents had been seen amongst them. It was still an open question, and far from being solved.

M. Bergeron, at the sitting of Feb. 19th, 1877, forwarded the following note to the Academy: "In a memoir crowned by the Institute, and which received the Chaussier prize, I have said that the salts of copper, in small doses, are not poisonous; but I do not feel justified in sanctioning the use of *vert-de-gris* for the coloration and falsification of aliments, and must oppose the dangerous conclusions drawn by M. Gallippe, though I may agree with him that the salts of copper, in the form of *vert-de-gris*, &c., are not poisonous, and that no one has ever been poisoned by them; facts perhaps established by experience and observation, by the unanimous opinion of those who, at home and abroad, have studied legal medicine, and have given their attention to the interests of justice and public health."

We believe that the whole matter lies in a nut-shell, and that the public should be guided in this matter by a little common sense. Sulphate of copper is not necessary for the preservation of vegetables or fruits, and is only used to render such articles of food more pleasing to the eye, and we are decidedly of opinion that as it is an *unnecessary falsification*, it should be discouraged and prohibited by law.

We know, from time immemorial, green conserves, green fruit, green pickles, have been indulged in with comparative impunity, but though as yet no inquest has been held on any victim from their consumption, and though our cemeteries are not ornamented with any tombstone with the significant epitaph "died from pickles," still we are aware that they have produced unpleasant symptoms, requiring prompt medical aid to counteract the irritant action of the metal.

To all intending purchasers and lovers of these peculiar condiments, we must give the sage advice of our contemporary *Punch* to the gentleman with matrimonial intentions, "Don't."

The Close of a Singular Case.

Recently died, in Jersey City, Corporal Latimer Whittle. He was shot through the liver and base of the lung in the Civil War. Though picked up for dead, he recovered, and his case is recorded as one of the rare instances of recovery from gunshot wound of the liver in the medical and surgical history of the Rebellion. He was dropped from the pension list in 1871 as perfectly well. Nine months ago, however, he was attacked with tuberculous symptoms in the wounded lung, and gradually failed.

Treatment of Bone Disease by Incisions.

M. Fort has a critique in *Le Paris Medical* on an article which appeared in *Le Progrés Medical* from the pen of Dr. Laffan, of Cashel. The article advocated the treatment of painful affections of bones by free incisions, where other treatment had failed. M. Fort after quoting the article goes on to say: "The communication of Dr. Laffan establishes a rule of practice for such cases" M. Fort then quotes a similar case which occurred in the practice of MM. Richet and Panas, and proceeds to comment sharply on the *Brussels Journal of Medicine* for claiming for Langenbeck priority in the employment of a similar treatment which he thus shows to have been pursued already both in France and Ireland. Incisions in inflammatory affections were recommended by Crampton but the proposal to extend them to purely painful disease of bones marks an advance on the lines of former teaching on the subject.

Literature in the United States.

A new library is in course of construction in the States which will be undoubtedly the finest which America possesses. It is the Lennox Library, so named from its founder, who has bequeathed 400,000 dollars to build it, and has endowed it with 300,000 dollars. The sum available for the purchase of books will be 212,000 dols. The building is to be 200 feet long and 125 feet wide, and constructed of white marble. It will contain 300,000 volumes, besides the private collection of Mr. Lennox, which contains 15,000 volumes, devoted mostly to the history of America and to Shakesperian literature. The Astor Library at New York, founded by the Astors—father and son—received from them an endowment of over three-quarters of a million of dollars.

Americans are often reproached for their utilitarianism, but it appears that such a reproach is unjust, to judge from the development of their public libraries. According to statistics of 1870, there existed in the States at that time 3,647 libraries, containing twelve and a quarter millions of volumes. At Baltimore the Peabody Library alone has cost at least a million and a half dollars. The Boston Public Library, is maintained by the municipality of that city, which costs the citizens 123,000 dollars annually. These figures represent the library organisation of the States seven years back, but a fresh report is in course of issue by the American Government, which will give us the facts up to the present day.

Consumption of Horseflesh in Paris.

In the year 1875 the horseflesh butchers of Paris have sold to the public 6,865 horses, asses, and mules; in 1876 the number reached 9,271, the weight being nearly three and a half millions of pounds. At Lyons the number of animals sold was 1,262 in 1875, and 1,088 in 1876. In Paris there are fifty-eight shops for its sale, and only seven in Lyons. The committee which is charged with the encouragement of this trade has recently forwarded

gold and silver medals to those dealers who have sold the largest quantity.

The latest Yankee Fashion in Quackery.

An American contemporary says that nothing of a therapeutical character has made such an excitement among the non-professional public for years as General Pleasanton's Blue-Glass Cure is creating just now. It is *the* topic in social circles, and a house with a southern window is not considered to be furnished until it has a foot square of blue glass suspended in it. The experiments are said to be most popular among those ladies whose adipose tissue is rather scant in comparison with their osseous development, and great things are in anticipation. Now is the chance for some of our pharmaceutical friends to make hay while blue sunshine is in fashion.

Dialysed Iron.

A preparation of iron has been recently introduced. It consists of the peroxide of iron in the colloid form held in solution in a small body of water: it is in fact a *soluble hydrate of iron*. It contains no trace of acid, the equivalent of acid being replaced by the equivalent of water by diffusion (dialysis). This preparation is the nearest approach to the form of iron contained in the blood and as it has no irritant properties it will doubtless prove to be most valuable of all the forms in which iron can be administered. We have already given the preparation an extensive trial. Although a strong solution it has scarcely any taste and is taken readily by children. It does not constipate nor disturb the digestion, whilst at the same time it produces all the good effects we are accustomed to recognise from iron in the other forms in which we have been accustomed to administer it.

The *solution* may be given in doses similar to the muriated tincture, that is, ten to fifteen drops or for children about five drops. It may be given before meals as it does not irritate the stomach.

It cannot be mixed with ordinary hard water which causes it to flake or gelatinise but it may be taken in distilled water or dropped on a piece of sugar. Not the least advantage of the dialysed iron is that it can be brought into contact with the teeth with impunity. It may be given with equal effect in the form of a *pill*, each pill being equal to ten drops of the solution, or as a *lozenge*, equal to two drops of the solution.

Phlegmasia in Typhus.

At the last meeting of the Biological Society of Paris, an instance of this extremely rare complication was brought under the notice of the Society by Dr. Dumontpallier, who had discovered in a woman suffering from typhus fever a double *phlegmasia alba dolens*, with very deep eschar of the sacrum.

The sacrum and the coccyx were altered to a great extent. There were recent sanguineous coagulations in the iliac primitive veins, extern and crural. In the veins which, near to the diseased parts of bones, penetrate into the hypogastrium, were found clots of blood much more ancient, and which were the cause of the other coagulations, and consequently of phlegmasia.

This observation of Dr. Dumontpallier is interesting, both in a clinical point of view—on account of the rarity of phlegmasia in typhus fever—and in regard to pathological physiology. Here, as well as in some cases of puerperal phlegmasia, inflammatory lesions were evidently the chief cause of veiny coagulation. This fact had not previously been noticed.

Opium Poisoning and its Antidote.

Some interesting cases of opium poisoning have recently been chronicled in our exchanges and deserve notice in our columns. The *Philadelphia Med. and Surg. Reporter* records the case of a lady who, through ignorance of the poisonous nature of the drug, gradually swallowed an ounce of opium whilst seeking to obtain relief from toothache. The ordinary remedies—such as mustard emetics, strong black coffee, friction, &c., &c., failing—the following was prescribed: ℞ Ext. belladonna, grs. xv.; aq. menth. pip., fl. ʒiv.; syr. aurant. cort., fl. ℥ ʒiv. Sig. Teaspoonful. After the first dose improvement was noticeable. The medicine was repeated first at the end of fifteen minutes, then twenty minutes, and again at the end of half an hour, after which an interval of two and a half hours was suffered to elapse before the last dose was given. Improvement was steady throughout, and the patient was quite recovered next day.

The counterpart of the above is to be found in the *Australian Medical Journal*, the notes of which are published by Dr. Williams, resident physician at the Melbourne Hospital. The case was that of a man, aged 70, who took a quantity of liniment in mistake for black draught. Shortly after he staggered and complained of giddiness. Two hours after taking the poison he was admitted into the hospital (7.15 a.m.), when the symptoms were increasing in severity and he could not stand without assistance. Dr. Williams introduced the tube of the stomach-pump, and washed out the stomach thoroughly. Finding the symptoms increasing in gravity, he then injected a grain of acetate of morphia hypodermically. This was at 8 a.m., nearly three hours after taking the liniment. At 9 a.m. the patient was quiet. The pupils were not so much dilated; pulse 120—full, bounding, but quite regular. At 12.15 p.m.: Slept at intervals, more sensible, answered questions intelligibly. Pupils less dilated, and contracting on exposure to light. The patient then rapidly progressed, and was discharged quite well two days after admission.

Dr. Williams was unable to ascertain the exact amount of belladonna taken; the symptoms, however, were those of imminent danger of death from the effects of that poison.

The above cases are decidedly interesting from a practical and clinical point of view. Experimental physiologists question the antagonism between belladonna and opium as antidotes one to the other. Such cases as these, however, together with the general experience of medical practitioners, and especially the experience of medical men practising in China, India, &c., where opium poisoning is a thing of frequent occurrence, tend to establish as a fact the mutual antagonistic properties of these two drugs.

Salicin in Typhus Fever.

THIS fashionable remedy appears to be undergoing the most crucial tests at the hands of the profession in all parts of the world. We have given considerable space in recording its supposed merits and demerits from the opinions of able authorities in this and other countries. We now add the views of some of our most distinguished Parisian *confrères* to those in our issue of the 7th inst.

Professor Robin has completed his recent experiments with this agent in typhus fever. He shows, with figures in hand, that this remedy diminishes almost constantly the quantity of excreted urine ; that in consequence of its being used, the quantity of *indican* increases. Its elimination may be very slow, and last seven and eight days. M. Robin points out a difficulty presented by its employment, viz., that it sometimes produces ulcerations in the throat and even consecutively in the œdemantous laryngitis. M. Robin recommends. in cases of typhus fever, to administer it only in a very diluted state, lest diuresis may be too much impeded.

M. Leven is of opinion that this substance should not be recommended in typhus fever even in small doses ; and when administered, in heavy doses, serious disorders in the digestive organs, may ensue.

M. Lépine, like M. Robin, has witnessed the slow elimination of salicylic acid. It often produces noise in the ears, but in a manner less constant and less intense than sulphate of quinine. Most efficacious in some acute rheumatic affections, it is of no utility in typhus fever. M. Rabuteau has declared that he cannot admit the conclusions of M. Robin, regarding the colouring matters of urine.

It will be thus seen that the views of our French *confrères* like those on this side the channel are very diverse, especially when taken in connection with the article which appeared in our issue of the 7th inst., the result suggesting a much more extended employment before any definite conclusion can be arrived at.

Cruelty to Animals.

WHENEVER any particular class of men have, for some reason or other, aroused popular prejudices, some little incident will often happen to give colour to complaints which really have little or no foundation. For this reason, we are sorry to see that at the Leeds Police Court on Friday a member of our profession, and a member of the medical staff of the Leeds Infirmary, was prosecuted by the Royal Society for Prevention of Cruelty to Animals for cruelty to a cat by striking it with a poker. It appears that on Sunday afternoon, the 4th inst., the defendant and three other gentlemen were in a room of the Leeds Infirmary when a servant entered for the purpose of putting coal on the fire, who, on approaching the coal-box, was told by the defendant to leave the room, as he did not require the fire made up. She, however, went close to the coal-box, from which at the same instant a cat sprang out with a cloth round its head, whereupon the defendant seized a poker, and struck the cat with it. The servant protested against such cruelty, when the defendant laughed at her. At eight o'clock the same evening another servant of the Infirmary was awakened from her sleep by the cries of the mutilated cat, which she wrapped in a shawl until the return of the lady-superintendent, when the animal was put out of its misery. It was then found that its skull had been fractured by the blow. Mr. Bruce considered the act a very cruel one, especially on the part of an educated man, and fined the defendant £5 and costs. The committee at the Infirmary have discharged the defendant without testimonials.

From the judgment passed by Mr. Bruce, and from the fact that Mr. Jenkinson has been discharged from the Infirmary, we are afraid that his conduct has been as cruel and as rash as above represented. It behoves every medical man—now more than at any other time—to show that he belongs to a profession in which humanity is as conspicuous as it is in any other walk of life. Doubtless, when Mr. Jenkinson struck the cat with a poker it was on the impulse of the moment, and without any intention of killing or severely wounding the animal. At all events, he has had to pay rather dearly for his rash act, especially if (as we think) his cruelty was not so wilful as it is represented in the papers.

But if Mr. Jenkinson's conduct was not wilfully cruel, it is at least to be deeply regretted. It shows not only a great want of self-respect, but very little consideration for the character of the profession to which he belongs, and it was exposing his professional brethren to reflections which they do not deserve. He should have recollected that, besides the watchful emissaries of the society above-mentioned, there is now abroad a number of anti-vivisectionists who are ever ready to pounce down upon such an incident as this, and to invest it with all the importance that their bigotry can suggest. He should have recollected that much of our modern humanitarianism is of such a distorted nature that its blessings are very unequally distributed, and that the poor woman who, after a long course of ill-treatment, has had her life nearly kicked out of her by her brutal husband will not nowadays meet with so much pity as the dog which suffers a little pain at the hands of the physiologist, or the cat which falls a victim to the violence of intemperate youth. The most zealous opponents of vivisection, or the most indefatigable members of the Society for Prevention of Cruelty to Animals, may not be otherwise remarkable for their humanity. They may not be good husbands, or good fathers, or good sons, but their enthusiasm in behalf of their dumb *protegées* is undeniable. They might even stand by—as some have done—and see a man drowning, or a woman half-murdered, without rendering any assistance ; but let them hear of some young enthusiast vivisecting a frog without a licence, or let them hear of such an incident as that which has recently been paraded in all the newspapers, and then their indignation will be unbounded. Mr. Jenkinson should have borne all this in mind, and then discretion, if not the common feelings of humanity, would have saved him from a little notoriety which is by no means to be envied.

It is to be hoped, moreover, that it will be long before any member of our profession will so far forget himself as not only to lose his own character for humanity, but to discredit the profession in the eyes of a very humane, but indiscriminating, public.

English Counter-Prescribers and their Fruits.

An inquest was held at Lambeth, last week, on the body of the child of an artisan, who is alleged to have died from the administration of some drug obtained from a Mrs. Coomber, a registered chemist. The child's mother deposed that the deceased was very ill, and apparently suffering from measles. Witness went to Mrs. Coomber, received two bottles, one containing castor oil and the other a medicine of a purple colour. Mrs. Coomber gave instructions that the deceased should have a tablespoonful of the castor oil, and after the lapse of an hour a tablespoonful of the medicine. Witness did as she was told; but, although the castor oil sent the child to sleep, the mixture had such an effect upon her that the witness could hardly hold her. About eight o'clock the next morning the child died. The child's father said he went to Mrs. Coomber and told her of the death. She at once said, "run back, then, and fetch the stuff," and he did so, and handed her the bottle. She put it to her mouth and said, "Lord bless my soul: it is a bad job; I can t do anything for you." She walked up and down the shop and got out of sight, and he suddenly heard the tinkling of glass. She then came forward and handed witness the bottle, saying, "It is no fault of yours or mine. *If I could have seen the baby my partner would have given a certificate.*" Witness ran home, and upon looking at the bottle saw that the purple liquid had been poured away, and a light-coloured liquid substituted.

The Coroner adjourned the inquest for a fortnight, for an analysis of the contents of the child's stomach.

Hygieopolis.

The proposition to lay out a town on the plan of Dr. Richardson's "City of Health," has reached a further stage—viz., the issue of a prospectus; and it now remains to be seen how far the project finds favour in the eyes of the general public, who, of course, are looked to for the "sinews of war." The directors are Dr. Ansell Ball, of Spalding, Mr. Saville Clarke, Dr. Baxter Langley, and Mr. Sherson, of London. The nominal capital is £250,000 in £10 shares. The site—which lies close to Worthing, in Sussex, and has a sea-frontage of about a mile—covers an area of 309 acres; and a maximum of garden space and boulevards will be laid out. There will be five classes of houses. The first, or best, class, which will be available at an annual rental of from £60 to £100, will contain twelve rooms; and the different classes will be determined according to their accommodation, the rent being charged accordingly.

Physiological Experiments on a Gastrotomic Patient.

M. Richet has instituted a series of physiological researches on a patient on whom M. Verneuil performed gastrotomy, and some of the results were communicated to the Biological Society of Paris, at their sitting, March 3rd, 1877, under the presidency of Prof. Claude Bernard. He has drawn the following conclusions:—

1. Hunger is not the consequence of a *vacuum* in the stomach.

2. Acidity of the gastric juice is due to the presence of chloro-hydric and lactic acids, is weaker fasting than during digestion, and does not vary with the quantity of fluid. It is increased by the use of certain stimulants, as wine and alcohol, whilst others diminish it.

Westminster Hospital.

After a vast amount of deliberation on the subject, it is at length decided to carry out extensive structural and sanitary improvements in this hospital. Many have thought, with a recent correspondent of the *Times*, that it would be better to remove the hospital altogether from its present site to some district wanting in hospital accommodation, and inhabited by a larger population. This proposal appeared to have many recommendations in its favour, especially as the present institution is within a short distance of three others of the same kind. It appears, however, from a letter in the same paper, from Dr. Rutherford Alcock, that the whole subject of an alternative site and a new hospital had been maturely considered by the authorities at Westminster Hospital. The considerations which have mainly determined the decision they have come to were—first, that the present building represented the original building founded in 1719, and that the three other institutions were all of recent establishment; and in the second place, that, while there is still ample field for the ministrations of the hospital, its removal would involve not only a much larger outlay than that at present contemplated, but also a loss of annual subscribers and support of every kind.

The first of these considerations, however, is not a very commendable one, as it appeals merely to the respect we all have for old institutions, and not to public necessity and the wants of the neighbourhood. There can be no doubt that—if it be true that the surrounding district, poor and squalid at present, is gradually being replaced by large offices and houses—the time will come when this hospital will have to die a natural death from sheer lack of nutrition, the supply of hospital funds and hospital patients being alike cut off.

The "Sweating System."

We are glad to see that something is to be done towards mitigating the evils which, in a sanitary point of view, result from this system, *i.e.*, work taken from tailoring establishments to be done at the homes of the working tailors. On Friday, a deputation from the Amalgamated Society of Tailors of the United Kingdom had an interview with the Home Secretary on the subject. Several speakers testified to the mischief resulting from the presence of contagious diseases in these over-crowded and unhealthy homes, mischief to which this and other medical journals have long directed public attention, Mr. M. H. Wright, of Glasgow, said that from personal observation, he knew many cases where garments, while being made for the public, acted as bed-clothes to fever-stricken patients, and of instances where contagion had thus been spread. Mr. H. Harry, of Manchester, said a committee had been appointed to ascertain the condition of things in Manchester. They visited over 1,000 homes, where work was done, and their condition was terrible. The average size of the rooms was nine feet by twelve feet,

and sometimes they found four or five persons making garments in the midst of domestic arrangements. They found 1,300 people thus engaged, so that in cases of disease the danger would be widespread. Other members of the deputation corroborated tho above statement, and begged earnestly of Mr. Cross to do something to meet the evil. The Home Secretary said he could not then state what would be the provisions of the Bill he proposed to lay before Parliament, and he was afraid he should not be able to accomplish it before Easter. He was glad to have heard their statements. Was he to understand they wished the practice stopped of persons working at particular shops making up clothes in houses where there were contagious diseases? Mr. Macdonald said "Yes," and added that it was not a trades question at all. The Home Secretary further asked how they would deal with the case of a working tailor in a house which was full of disease, with his wife and child down with small-pox; would they prevent that man going to work in the ordinary workshop? A member said he would be requested to retire till he had a clean bill of health. No doubt there are difficulties in the way of bringing these tailors' homes well under the control of our present sanitary acts, but they are not insurmountable, and in the meantime, without making any further comments on the subject, we shall wait to see what steps Mr. Cross proposes to take to meet them.

The Oral Instruction of Deaf Mutes.

H.R.H. THE PRINCE OF WALES presided on Tuesday week at a dinner in aid of the institution established in Fitzroy Square for the Oral Teaching of the Deaf Mute. In a well-arranged and interesting speech the Prince traced the earliest efforts made to teach the deaf and dumb to speak. This commenced in the sixteenth century, when a Spanish Benedictine monk attempted to teach some deaf and dumb children to utter sounds. But it is to Dr. Amman, a native of Schaffhausen, on the Rhine, who practised medicine in the seventeenth century, that the merit belongs of having successfully placed the lip method of instruction upon a scientific and practical basis. Since then Drs. Holden and Wallace, of the Oxford University, zealously engaged in the work, and it has been most successful throughout Germany, Austria, and Holland, whilst England and France have somewhat obstinately and unwisely adhered to the sign method.

It has been said that dumb children were in the Dark Ages subjected to experimental operations for the cure of the supposed defect of speech. A more rational method soon succeeded, and the profession were among the first to recognise the fact that dumbness, as a rule, arises from no imperfection of the organs of speech, and that deafness alone debars the child from a perception of sound, and renders it incapable of imitating the articulate speech of its parents. The system of oral teaching, as introduced and practised by Mr. W. Van Praagh, is based upon this fact, and by slowly practising his pupils to imitate articulate sounds, and by calling to his aid the senses of sight and touch; it is found that they easily learn to imitate the motions of his lips, and read by sight (the words which he pronounces.

The deaf-mute, in this way, can be taught to converse with those who do not understand the sign and gesture method. We share in His Royal Highness's pleasure at having for the first time witnessed the facility with which young children distinctly articulated words and followed the motions of their excellent instructor's lips. We trust soon to see this valuable method generally adopted in this country.

Dr. Moxon on Fallacious Experiment.

THE Hunterian Oration which Dr. Moxon has recent y delivered is an admirable one, and will well bear comparison with the oration of Sir James Paget. Its chief and most laudable feature is the bold manner in which the orator assailed certain modern phases of thought, and certain medical fallacies and practices which threaten to act injuriously upon the minds of the rising generation of physicians. We cannot in one "Note" notice all the good points in this excellent oration, but we may here draw attention to his remarks on medical experiment, more especially as we have long entertained very similar opinions.

After defending the experimental philosophy from the doubts which John Stuart Mill cast upon it with regard to its application to practical medicine, Dr. Moxon admits that the criticism of the great logician was incurred more by the method in which medical experiment is usually conducted than by the inapplicability of the inductive principle to purposes of medical research.

"And did he (Mill)," observes Dr. Moxon, "overestimate the difficulties of Hunter's profession when he thus wrote? Must we not confess how often in our most formal efforts we not only cannot obtain correct answers, but cannot even ask good questions?"

Dr. Moxon then passes some very just criticism upon the recent discussion on syphilis at the Pathological Society, and upon the very illogical arguments and discussion lately raised at the Clinical Society upon the question whether phosphorus cures leukæmia. But the best points he made on this subject were his remarks on the salicin treatment of rheumatism, and the recent experiments of the Edinburgh Committee on the action of mercury. On the latter subject he said:—

"Neither would Mr. Mill yield any more homage to a type of our modern experiments, such as that undertaken by a certain committee to decide the question whether mercury is useful in moving the bile. The practical question before that committee was whether mercury would unload engorged human livers. To settle this they took *healthy* dogs, and, regarding lightly the vastly important connections of the duct or pipe which carries bile out of the liver, this duct—with its neighbouring vessels and nerves, and its wonderful structure—they cut it boldly through, and brought it to the surface, and fastened it to the skin outside, and then they gave the dog mercury; and they say it did not unload him of bile! Now, I can fancy that Mr. Mill would grin rather solemnly at that experiment if he were fond of dogs. For, first, as to unloading the dog's liver, it was not shown to be loaded at all like the engorged human livers of the *practical* question are loaded, which loaded livers mercury is thought to relieve. And Mr. Mill might ask, 'What did these people think we meant when we said mercury unloaded the liver? Did they think we meant that it squeezed it, as in a cheese-press? Or what force did they think the mercury would use that it could act in spite of all this rudeness? Does experience lead us to think biliousness is determined by very rough measures.

Some people grow bilious on sherry, and not on port, and if the bile is determined by such trifles, could it be indifferent to the dragging of the bile-duct from its supremely important connections, and cutting and trying it? Surely it is possible that it is along this pipe that the mercury acts, so that its channel was cut off.' And Mr. Mill might say what I would not, and ask whether a simpler experiment would not have answered better. He might ask whether, if this committee, instead of hardening their hearts and sharpening their knives, had met in a protracted dinner-party to quicken their brains and thoroughly engorge their livers, and had then each taken a blue pill, and in due time held another committee, the experiment would not have been of less boastful quality, more truly reasonable, and might not have ended in establishing mercury more firmly than ever in its almost proprietary command over the British liver."

This is a long quotation to make, and we really object to long quotations as a rule, but we feel sure that the reader will forgive us for making it. That the experimental method of inquiry is applicable to medicine, even to therapeutics, we have never for a moment doubted, but at the same time we have always thought that the method has been very much abused by the profession. And it is just that abuse of the inductive method to which Dr. Moxon more particularly refers that has brought medical experiment into contempt. The difficulty in our way is to know how to make use of it. If the medical student were taught a little more logic and a little less biology, how much better it would be for their patients and the advancement of medicine.

Moreover, we have an additional reason to condemn all fallacious and useless experiments on living animals. We have the eyes of the anti-vivisectionists upon us, and woe be to those who set about them without duly consulting what they have to learn and how best to learn it. We shall not be surprised if they make a handle of those very just and timely remarks of the Hunterian orator.

The Latest Army Medical Candidates.

Of the many signs of Army medical decadence which it has been our painful duty to notice during the past three years, nothing has at all approached the evidence of degeneracy afforded by the last examination. According to Mr. Hardy's statement in the House of Commons, 23 candidates presented themselves for fifty vacancies, and according to the published results of the examination only 17 succeeded in obtaining the minimum of marks required to qualify for admission. Thus it appears that more than one-fourth of the total number of applicants were absolutely unfit to be allowed into the medical department under any circumstances. This we unhesitatingly repeat is a proportion of unworthiness never before known since the competition system was first instituted, nearly twenty years ago, and it proves but too plainly the grade of applicants to which the medical appointments have now descended. Whether, under these circumstances, Parliament will permit Mr. Hardy to continue his destructive experiment for a "much longer trial," remains to be seen.

The London Fever Hospital has received a donation of £50 from the Queen, and also one of £21 from the Prince of Wales, in aid of the funds of the institution, which are rapidly decreasing.

The monument to Linnæus was unveiled in Stockholm on January 10th, 1877, 36,000 crowns having already been collected.

Since the night medical service in Paris was inaugurated on the 1st of January, 1876, 12,768 persons have applied for assistance, and a very large proportion have reimbursed the expenses.

The kingdom of Prussia, which contains, according to the last census, 24,693,112 inhabitants, has 7,952 physicians, inclusive of 791 belonging to the army, and 146 employed in hospitals; and 16,951 examined midwives.

As the House of Charity in Soho Square has a large number of unoccupied beds, they have placed twenty of them at the disposal of the Middlesex Hospital Medical Staff for convalescent patients, which boon has been eagerly accepted.

At the annual meeting of the governors and staff of the London Dental Hospital, Mr. John Eric Erichsen, F.R.S., Surgeon Extraordinary to the Queen, was unanimously elected Chairman of the Committee of Management in place of Mr. Campbell de Morgan deceased.

A concert was given at the Royal Academy of Music, on Monday evening, in aid of the Health Resort and Convalescent Fund of the Central Throat and Ear Hospital. If a crowded audience may be taken as an earnest of pecuniary success, the fund for which the concert was given should be considerably benefited.

Of the 96 deaths from small-pox in London last week, 43 were returned as unvaccinated, 25 as vaccinated. In the remaining 28 cases vaccination was not certified. Of the 9 fatal cases in the West Ham district, 8 were adults who had been vaccinated in infancy but had not been re-vaccinated, the other was an unvaccinated child aged three years.

The number of deaths from small-pox varies but little. Last week it was 107, the previous weeks since Jan. 1st ranging between 103 and 118. Of those which occurred last weeek, 96 were returned in London, 7 in Liverpool, and 4 in Manchester and Salford. There were no deaths from the disease in any other town.

The mortality last week in the principal large towns of the United Kingdom was higher than it has been through the winter, averaging 27 per 1000 of the population. Oldham being at the head of the list; next in order being Dublin with 35; Leicester and Salford with 34 each. The lowest death-rate in these towns being at Portsmouth with only 15 per 1,000.

On Saturday last, the coroner for Liverpool held an inquest on the body of a woman who had died under very peculiar circumstances. The deceased was a domestic servant, and during sleep had swallowed a set of false teeth; this lodged in the trachea, and was the following day removed by an operation. Subsequently an abscess formed, and death ensued from suffocation.

It is proposed to rebuild the Bolton Infirmary and Dispensary at a roughly estimated cost of from £60,000 to £70,000, towards which Messrs. John Musgrave and Son have promised £5,000. Other liberal support has been offered, and Dr. Chadwick, of Southport, bequeathed £1,000 conditionally upon a ward for children being built within four years, and Mr. Nathaniel Greenhalgh, of Sharples, £1,000 conditionally upon a new infirmary being built within ten years.

THE SANITARY INSTITUTE OF GREAT BRITAIN.

A PUBLIC meeting of the members of this institute was held on Wednesday last, at the rooms of the Society of Arts, under the presidency of the Duke of Northumberland.

The CHAIRMAN stated that the subject to be dealt with by the meeting was the report recently presented by the committee appointed by the president of the Local Government Board on the modes of treating town sewage. As far as he had seen the result of that report was in favour of one form of treating town sewage. London was greatly indebted to Sir Joseph Bazalgette for the formation of a system of sewerage to which there was no parallel in either ancient or modern times, and he had succeeded in adding to the means of carrying out that system by the creation of a number of open places which no other country in the world could boast of.

Sir J. W. BAZALGETTE (vice-president of the institute) said the conditions essential to the health of cities and towns were pure air and a pure and abundant supply of water. The means, however, of removing from towns rapidly, and without contamination, the rainfall, and drying the subsoil, and removing all decomposition in the most efficient manner, was a subject upon which there was a great variety of opinions. He regarded the report of the committee appointed by the President of the Local Government Board rather as a record of failures than successes; but it was useful inasmuch as failures taught one what to avoid. He quoted the various conclusions of the committee, and gave a number of instances to show that the value of sewage for manuring land was greatly exaggerated. Some thirty or more years ago London sewage was thrown into cesspools, and that was a horrible state of affairs, the ground being saturated with sewage. It was then wisely decided that they should be destroyed, and that the sewage should be turned into sewers, the result of which was that the Thames became polluted, and that gave rise to an act resulting in the carrying out of the main intercepting system and the diversion of the sewage from the river. In London was seen the best example of the disposal of sewage on the principle of carrying it all away by the water-carriage system and putting it into the tidal outfall. The expenditure in London, inclusive of interest on capital borrowed for the construction of the main sewers, and inclusive of the annual cost of pumping 136,000,000 gallons daily in dry weather thirty-five feet high, and all cleansing and maintaining, had been at the rate of 1s. per head per annum. But had London adopted one of the processes of purification, and obtained sixty square miles of land for a sewage farm (which was the extent which would be necessary), it would have led to a large failure and costly delay. Comparing London with Paris, he said that the latter had adopted a system of removing sewage by pails; the cost of constructing their main sewers had been £4,000,000 (the same as that of London), and the cost of cleansing and repairs in Paris where there was no pumping had been £59,000 per annum or 6d. per head of the population. In London, where the sewage was lifted an average height of thirty-five feet, the cost was only £58,000, or 3½d. per head of the population, although we had the additional work of pumping. In Paris they removed the soil by carts, and in 1869 they removed 600,000 cubic metres by their process, which cost them 2s. 3½d. per head. If their process were applied to London it would mean that in London an additional £487,000 per annum would have to be expended. The conclusion at which he had arrived was that no one system for dealing with town sewage could be advocated as suitable for all places. He believed that cesspools, middens, and dry earth systems were objectionable for towns, and that purification by chemical means were costly and unsatisfactory, and should only be adopted in exceptional instances.

Mr. C. F. GARDNER (of Ashbourne) spoke strongly in favour of the system of scavenging and disposing of sewage as adopted at Manchester, and contended that not only should the dry system be supplemented by the water system, but that the water system should also be supplemented by the dry system. He objected to the way in which the committee in their report had treated the dry system of sewage.

The CHAIRMAN proposed the adoption of the report of the committee of the Sanitary Institute of Great Britain. That document referred to the increasing importance which was attached to sanitary science, and to the encouragement in their work of collecting and imparting information upon all matters connected with the subject of public health received from the active part, publicly and privately, taken by the Duke of Northumberland, president of the institute. The report also stated that the establishment in London of an exhibition of sanitary apparatus and appliances would probably be among the most useful of the functions which the institute could undertake.

Dr. WILILAM FARR seconded the motion. He expressed regret that no use was made of the manure of London, and trusted that some means would be found for distributing the refuse now thrown down the Thames upon the land below London. There was great necessity for further inquiry being made on the subject.

The report was unanimously adopted.

Dr. RICHARDSON proposed, and Mr. H. C. BARTLETT seconded, a vote of thanks to the Chairman, which was passed, and the meeting was adjourned to April 11.

Correspondence.

SALICIN, SALICINE, OR SALICYLIC ACID—A QUERY?

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

SIR,—Since the introduction into this country, not long ago, of salicylic acid as a therapeutic agent, I, as well as others, have employed it largely and with great satisfaction; I wish it therefore to be treated with common respect, and not be everlastingly called by improper names, for I have of late remarked that writers in almost every medical periodical I take up send reports of their experiences of it, get them printed, make a most confusing muddle of the little stranger—calling it one time salicine, another salicylic acid, sometimes even in the same sentence. Now, unless the muddle be on my side and not theirs, salicine is the patronymic of the bitter alkaloid salt extracted from the willow (*salex*) bark, *long, long ago* introduced as a substitute for sulphate of quinine, and from its close resemblance to which has been often employed by unprincipled chemists to adulterate the quinine salt—while salicylic acid has no resemblance or affinity whatever, chemical or otherwise, to salicine (excepting only the first part of the spelling), but is on the contrary nearly allied to carbolic or phenic acid, from which it is obtained by distillation, I believe. Yours sincerely,

Taunton, March, 1877. J. CAREY, M.D.

LEPRA GRÆCORUM.

TO THE EDITOR OF THE MEDICAL PRESS AND CIRCULAR.

DEAR SIR,—The *Evening Telegraph* has thought fit to make a furious attack on me, impeaching me with "unmitigated barbarity," because I offered in the MEDICAL PRESS of the 7th inst. to afford my medical brethren every opportunity of inspecting a case of that rare disease, "lepra græcorum," likely to become more frequent from our increasing intercourse with the East; and because I professed myself willing to facilitate the transfer of the patient to Dublin, in order that the medical classes might have an opportunity of making themselves acquainted with the second case of the disease ever seen in this country within the memory of the present generation, I am accused of undertaking a measure "hazardous to the public and unfeeling to the man." In undertaking to afford every facility for studying this very rare affection, I was plainly acting in the interests of the public. As the man himself is willing and anxious to go to Dublin, there was nothing unfeeling in proposing to transfer him thither; and as the disease is only communicable by prolonged contact, such as wearing the same clothes, or sleeping in the same bed, there could be nothing hazardous to the community in consigning him to a third-

class carriage for three hours by rail. The attack on me fails signally on every point. Whether the profession is assailed, or meant to be assailed, by implication, I shall not attempt to decide; but, as far as I am concerned, the observations of the *Evening Telegraph* are wantonly and gratuitously calumnious. In writing as I did I had plainly no motive but to serve the interests of the community by extending medical knowledge, without any sacrifice of humanity, or any risk to the public weal.

Yours very truly,

ZACH. JOHNSON, A.M., F.R.C.S., &c.

Kilkenny, March 12, 1877.

[Perusal of the remarks of the *Evening Telegraph* enables us to say that our correspondent's indignation is perfectly justified. The tirade is an ignorant misrepresentation, having probably some *animus* other than the humanitarianism, which its writer lays claim to. If the *Telegraph* had troubled itself to ask a question of any medical student, or to take a glimpse into any manual of practice of medicine, it would have learned that no barbarity—hardly even discomfort—is involved in the sending of a case of lepra græcorum from Kilkenny to Dublin. But probably the *Telegraph* desired to vituperate, not to learn or to speak truth. When a penny-a-liner gives his fingers free action on a medical subject, the result is generally the same as in this instance—a pitiful display of self-confidence and want of education.—ED. M. P. & C.]

NOTICES TO CORRESPONDENTS.

☞ CORRESPONDENTS requiring a reply in this column are particularly requested to make use of a *distinctive signature or initials*, and avoid the practice of signing themselves "Reader" "Subscriber," "Old Subscriber," &c. Much confusion will be spared by attention to this rule.

READING CASES.—Cloth board cases, gilt-lettered, containing 26 strings for holding each volume of the MEDICAL PRESS AND CIRCULAR, can now be had at either office of this Journal, price 2s. 6d. The postal regulations not allowing the Journal to be stitched, these cases will be found very useful to keep each weekly number intact, clean, and flat, after it has passed through the post.

DR. WYCKOFF, of Brooklyn, New York, writes "The general vindication of the independent conduct of the MEDICAL PRESS AND CIRCULAR is noted with pleasure, even on this side the water.' We are glad to notice that the course we have pursued is as highly approved by the profession in America as in this country, and it is a striking contrast that, whereas the medical journals of the United States, with scarcely an exception, drew attention to the recent action against us, commenting in kindly terms in our favour, the journals of Great Britain, on the contrary, who were as much interested in the principle for which we contended as ourselves, allowed their feelings of jealous rivalry to overcome their duty to the profession, and ignored the case. To Dr. Wyckoff we beg to offer our thanks, as well as to the whole medical press of America.

NOTICE has been given that an examination of candidates for nineteen appointments as surgeon in Her Majesty's Indian Medical Service will be held in London in August, 1877. A further notice will be issued when the exact date of examination has been fixed.

THE next evening meeting of the Pharmaceutical Society of Great Britain will be held on Wednesday evening, April 4th, 1877, at eight o'clock.

ROYAL COLLEGE OF SURGEONS OF LONDON.—On Friday next, at 4 p.m., Prof. Flower, "On the Comparative Anatomy of Man."

ROYAL COLLEGE OF PHYSICIANS OF LONDON.—On Friday next, at 5 p.m., Lumleian Lectures: Dr. George Johnson, "On the Muscular Arterioles, their Structure and Function in Health and in certain Morbid States."

CLINICAL SOCIETY OF LONDON.—On Friday next, at 8½ p.m., Mr. Barwell, "Excision of a Lingual Epithelioma by Dr. Petrequin's Thermo-cautere."—Mr. C. Lucas, "Excision of Lower Half of Ulna for a Myeloid Tumour" (a living subject)—Mr. Geo. Brown, "Excision of Tongue for Cancer supervening on Ichthyosis of twelve years' standing."—Mr. Warrington Haward, "Recurrent Cancer of Tongue treated by Ligature of Lingual Artery."—Dr. Southey, "On a Case of Idiopathic Tetanus."

CRUSTACEAN ATROCITIES.—A comic contemporary publishes a *jeu d'esprit* purporting to be a report of the proceedings of the Cheese-mite Protection Society:—"Stimulated by the noble example shown by a benevolent baroness, a society, under the above title, has been inaugurated under the presidency of Prof. Butteredoats. At the society's first meeting, which was held last week, Dr. Chickenhardt read a paper descriptive of a newly-invented process for the painless boiling of winkles. The operation was extremely simple, and consisted in treating each separate living mollusc with chloroform by means of a small syringe. Laughing-gas, the learned doctor remarked, answered equally well, but was attended with the disadvantage of so exciting the winkle's risibility that it wriggled out of its shell before it was properly cooked, and so was spoilt for the market. Dr. Chickenhardt likewise exhibited his new oyster-knife, which, being highly magnetised, communicated a shock to the bivalve, depriving it of consciousness, and preventing it from experiencing the horrible sensation of being boiled alive. In the discussion which ensued, a member remarked that it was time that steps were taken to mitigate these crustacean atrocities. He had been informed on good authority that the shrieks which were heard nightly proceeding from the boiling-house attached to the fish-shop near Temple Bar were so excruciating that the neighbours could get no sleep, and that house property in consequence had deteriorated in value. Another member observed that he had been informed in confidence by a retired fishmonger that it was the exertion of shrieking that turned the lobster red, and that the creature was tortured and goaded to make it shriek louder, and so improve in colour. (Sensation). Mr. M. T. Head hoped that the society would soon give its attention to the abominable cruelty involved in treading on a worm until it turned. There could be no doubt, from the frequency with which the heartless and wanton pastime was alluded to, that it was more commonly indulged in than was generally supposed. Cock-fighting had been put down, and badger-baiting, and the poor blind earth-worm should be similarly protected. The very fact of no instance being on record of a worm ever having turned until it was trod on was unimpeachable evidence, not only of the creature's intelligence, but also of its peaceful and unobtrusive nature. In illustration of what kindness will effect as regards even this low form of animate nature, Professor Butteredoats mentioned the case of a leech in the possession of his sister. Owing to the gentle and considerate treatment the little animal had on one or two occasions received at that lady's hands, it had contracted such affection for her as to wag its tail in friendly recognition whenever she approached the glass-bottle in which it was deposited. She had attempted to use it on herself for phlebotomic purposes, but it had turned away its head, and no persuasion would induce it to bite her. The president having announced that the subject next on the list was an inquiry into the cruel practice of swinging cats in rooms too small for the purpose, the meeting separated.

VACANCIES.

Limavady Union.—Medical Officer for the Belluvena District. Salary, £100, with £15 extra as Sanitary Officer. (See Advt.)

Cancer Hospital, Brompton.—Dispenser. Salary, £80 per annum, with parial board.. (See Advt)

East London Hospital for Children.—Assistant Physician. Honorary. Attendance required two afternoons each week. Applications to be made to the Secretary on or before the 22nd inst. (See Advt.)

Wolverhampton General Hospital.—Surgeons' Assistant. Board and lodging, but no salary. Further particulars of Mr. Vincent Jackson, 46 Darlington Street

Berks County Asylum.—Assistant Medical Officer. Salary, £80, with board. Address the Medical Superintendent, at Moulsford.

Hull Dispensary.—House Surgeon. Salary, £150, with residence. Applications to the Hon. Sec.

Bristol Lunatic Asylum.—Assistant Medical Superintendent. Salary, £100, with board and residence. Applications to the Chairman of Committee, at Stapleton.

Buckingham General Infirmary.—Resident Surgeon and Apothecary. Salary, £100, with board. Testimonials to Mr. G. Fell, Solicitor, Aylesbury.

APPOINTMENTS.

BLAKER, T. F. I., M.R.C.S.E., House Surgeon to the Brighton and Hove Lying-in Institution.

CAPON, H. J., M.R.C.S., House Surgeon to the Dorset County Hospital.

GOULDER, F. S., L.R.C.P.L., M.R.C.S.E., Junior Resident Medical Officer to the Royal Free Hospital.

PAGE, W. I., M.R.C.S.E., L.S.A.L., Medical Officer to the Wimbledon Hospital for Infectious Diseases.

WELLS, Mr. T. SPENCER, Consulting Surgeon to the Samaritan Free Hospital.

WOOD, JOHN, F.R.S., F.R.C.S., has been elected to the Professorship of Clinical Surgery in King's College Hospital, vice Sir Wm. Fergusson deceased.

Births.

ANDERSON.—On the 9th inst., at Upper Berkeley Street, Mrs. Elizabeth Garrett Anderson, M.D., of a son.

MCCLURE.—On the 9th inst., the wife of Thomas McClure, M.D., F.R.C.S.I., of Verandah House, Worle, Somersetshire, of a daughter.

PURVIS.—On the 12th inst., at Royal Hill, Greenwich, the wife of John Prior Purvis, M.R.C.S.E., of a daughter, still-born.

Marriage.

WILTSHIRE—WATERLOW.—On the 15th inst., at St. John's, Redhill, Alfred Wiltshire, M.D., of Wimpole Street, London, to Kate, second daughter of the late A. C. Waterlow.

Deaths.

ADYE.—On March 13, at Bradford-on-Avon, Arthur Adye, M.R.C.S., aged 79.

BEATTY.—On March 13, at 62 Lower Mount Street, Dublin, after a few days' illness, Annie, the beloved wife of J. G. Beatty, M.D.

COCKS.—On March 6, at Liscard, Cheshire, William Lawrence Cocks, M.R.C.S.E., aged 75.

KING.—On March 4, at Richmond, Surrey, Samuel King, L.S.A.L., aged 73.

MARSHALL.—On March 12, at Gordon Villa, East Cowes, Peter Marshall, F.R.C.S.E., late of Bedford Square.

SPRIGGE.—On March 11 at Watton, Norfolk, after a short illness, S. Sprigge, Surgeon, aged 57.

By G. de Gorrequer Griffith, L.R.C.P., M.R.C.S., &c.,

Senior Physician to the Hospital for Women and Children; Physician to St. Saviour's Maternity; late Resident Surgeon to the Lock Hospital.

(*Continued from page* 226.)

I shall now describe how I should act if a case of gonorrhœa, or of doubtful discharge occurring in the female came before me for the first time.

I should at once make a vaginal examination with the speculum, suiting the size of the instrument to the calibre of the *os* vaginæ, and placing the patient on her left side for the purpose of the inspection. I never adopt the position on the back—1st. Because females themselves consider it so indelicate, and objectionable; and 2nd. Because the left lateral position is in every way preferable as regards the examiner. There is no necessity for screening the patient's face, since it is turned away towards the wall. The woman's knees being placed together remain in that position undisturbed; whereas, on the back they would in a great many instances require an assistant to hold and steady them; on the left side the patient's dress can be so arranged that we can conduct investigation and apply our remedies without offence to her delicacy—supposing our patient to be a chaste married woman—without, indeed, making her experience the same sense of exposure which she does when on her back, and which makes her so uncomfortable that she will often move about and shift her position, simply because she feels so stripped and abashed.

A visual examination of the labia, both external and internal, and of the urethra, is not by any means enough, because in the very case we might so examine, there may be no trace of discharge at any of these situations, nor even any redness, or other appearance of inflammation, and in such, depending solely upon this kind of examination, we should be thrown completely off the scent, and baffled in our diagnosis. Whereas, when we come to make a speculum introspection we shall perhaps find the indications of evil higher up in the vaginal canal.

Placing the patient, then, on her left side, in order to make the examination, anointing the instrument well with lard, and over it smearing thickly a covering of balsam, which I prefer to have somewhat inspissated: no matter how acute the vulvitis or vaginitis may be, I proceed to explore the passage with the speculum, passing it carefully along and well up to the os uteri, mopping clean the different surfaces, which is easily done by shifting the position of the instrument, and, as we withdraw it, swabbing the vagina dry of all discharge.

In using the speculum we need give very little, if, indeed, any pain, particularly when we bear in mind the axiom to adapt the size of the instrument to the os vagina. We can thus thoroughly explore the parts, and apply our remedies with the greatest ease.

I next take a clean speculum anointed in the same way as the other, and introducing it per vaginum, again review all the parts, including the os and cervix uteri; if I find great congestion, accompanied or not by non-specific abrasion, I freely scarify, and by depletion relieve the engorgement. Having soaked a plug of cotton wool, adapted to the size of the vagina, in the inspissated balsam, I insert it through the speculum right up against the os, and with it, or with separate pledgets of wool, soaked in the balsam I fill the anterior and posterior *cul de sac* of the vagina, and cover the portion of cervix which may project into the canal; withdrawing the speculum a little, I pass in another large piece of soaked wool for two purposes—first, to retain *in situ* the uppermost pieces; and, secondly, that from it the medicament may flow down the vagina to the labia, and lave all the inflamed parts, as the patient rises from the couch. At times I have found it advantageous to insert a tampon of dry wadding after apposing the balsamic pieces, and to lay a layer of the same, previously soaked,

against the orifice of the vagina, and over the mouth of the urethra.

I can speak from the experience of some thousands of cases, that this method will rapidly effect a cure—so rapidly in some instances as to be a source of surprise both to the patient and to her medical attendant.

It may be supposed that the introduction of the speculum, when there is vulvitis and vaginitis, will give great pain; no doubt it will occasion more than if no morbid changes had taken place; but, frequently, when the instrument has been in for a little time, and the first burst of pain over, a sense of relief will be experienced by the sufferer, not alone from the pain of the speculum introduction, but from the pain and distress dependent on the malady; this relief arises from the facts, that the nervous sensibility is at least in a measure deadened by the pressure of the instrument, and by the reduction of the congestion—as a result of that pressure—and the swollen state of the blood vessels and inflamed parts generally.

While conducting the topical treatment, I prescribe to be taken internally large doses of liquor kali, so as to neutralise the urine, and thus render it less irritating to the urethra and to the bladder, which we often find in a more than usually sensitive state, dependent on the exalted blood action going on in all the contiguous parts. I at the same time give pulv. jalap co. in order to procure very free action of the bowels and kidneys, and find the powder act most efficacicusly, the aperient not preventing the diuretic effect: demulcent drinks may likewise be taken, as freely as may be wished, but not to such an extent as to upset the stomach. I allude to this precaution, because I have found that in telling a patient to drink freely of demulcents, and thus giving him *carte blanche* in the matter, he does not exercise his common sense, but imbibes so much of them that he disarranges the stomach, rendering it incapable of tolerating the medicine, which intolerance leads him to suppose that the medicines are disagreeing with him.

I have met with some instances where pain has been experienced in the labia, urethra, vagina, uterus, ovaries, and also the rectum, and others where all those parts are likewise found to be tender on examination with the fingers.

These conditions I relieve by employing at the same time, and mixed with the balsam, equal parts of tincture of opium and tincture of aconite, and in such a mixture soaking the cotton wool plugs before introduction into the vagina, in the manner I have described; also by passing into the rectum suppositories of the same drugs; combining with the liquor kali given by the mouth, pretty large doses of bromide of potassium, with or without tincture of aconite.

I invariably recommend the frequent emptying of the bladder.

The mixture of tinct. opii and tinct. aconite, with the balsam, will sometimes produce smarting and stinging in the vagina, but when these pass off, great relief will be experienced, and a distinct subsidence of the inflammatory symptoms. In those patients who are constitutionally very sensitive to pain, I omit the tinctures, using some other preparation of the medicines.

There is a plan about the employment of suppositories which I find not generally heeded, and I think it worth while naming here.

A patient is told to use a suppository night and morning. That used at the former time may happen to be inserted at the right moment—viz., at bed-time, after which it lies in the rectum undisturbed; but the morning one may be employed just before getting out of bed, or while the patient is dressing, and shortly afterwards there may be the usual morning evacuation of the bowels, by which the good effects of the suppository is nullified, owing to its expulsion. Hence, I invariably direct that the medicament be placed *after* the bowels have been relieved—that is, if the customary action be early in the morning. This is a precaution worthy of adoption.

Neglected vaginitis, or gonorrhœa, may lead to organic changes in the vulva, and in the vagina itself, also in the uterus, ovaries, rectum, bladder, and urethra, if morbid action spread to them Hence it would be unwise not to check the diseased condition as quickly as possible, and limit the area of its effects; and I know of no way calculated to accomplish this so efficaciously, and so rapidly as the system I have just laid down, and which I have now pursued for some years with the happiest results.

One great element of success has up to the present remained unmentioned by me. It is rest. By it I mean, in the milder cases, as little moving about as possible; in the severer, absolute rest in bed. I have reserved this advice till the present moment because of its importance, and that it may engage the more attention by filling up the last niche. Rest, Rest, Rest, in all cases, as much as possible! In both the male and female, I have known a very mild attack to be developed into a very severe one, either by a long walk, or by even too much going about in the house, or even by running quickly, although but a short distance; also by want of local rest dependent on the straining efforts occasioned by allowing constipation, and the subsequent attempts necessary to empty the bowels, especially the over-loaded lower bowel, or rectum.

It is often advisable, when the lower bowel has become loaded, or is even sluggish in its action, to administer a hot-water injection into the rectum about an hour before bed-time, and to get the patient to retain it as long as is consistent with comfort. The hot water acts not only as an aperient, but as a solvent to the alvine accumulation which has become, most probably, dry and hard, because of its having lain in the bowel longer than natural, and had the liquid portions absorbed.

Another effect of the hot water is that it exercises a soothing influence on the contiguous irritable parts, being, in fact, a kind of internally-applied poultice.

I have known instances where gonorrhœa in the female, neglected and increased by want of rest and due attention to the precautions I have enunciated, has lighted up not only inflammation of the womb, but also peritonitis, often of a severe type and sometimes of an intractable kind.

Uterine colic, or the ordinary colic of the bowels, may supervene, and occasion our patient excessive agony and subsequent exhaustion.

For these affections, in addition to the usual trite remedies, I make the patient lie on a large vulcanite hot water bottle placed under the back at the dorso-lumbar or renal regions, while there is laid all over the abdomen a piece of soft, thin flannel, or other light material, previously warmed, which, when duly apposed, has freely poured over it to saturation a warm lotion of equal parts of tincture of opium and tincture of aconite, this in turn covered over with a layer of cotton wool, and all made secure by lightly fastening on a silk pocket-handkerchief, when practicable, or a broad roll of fine soft flannel.

I would mention that there is no particular virtue in the silk pocket-handkerchief except for the sake of appearance, and for its lightness, and because some patients prefer it next the skin—at those parts of the body where it must touch the surface—to even the finest and softest flannel.

The warm lotion should be poured to saturation on the flannel, lint, or whatever else may be used, every two or three hours, till the pain is lulled—indeed, it may be even oftener if the temperature of the abdominal integuments be high. The hot-water bottle must, of course, be changed or refilled when the water begins to be cooled, so as to maintain the temperature at the height which was first applied.

I have never found any inconvenience result to the patient from the free use of the lotion; yet I think it prudent to watch the pulse, the temperature and the condition of the stomach while this line of treatment is being pursued.

(To be continued.)

TRACHEOTOMY, AND ITS ADVISABILITY IN CERTAIN FORMS OF SYPHILITIC DISEASE. (a)

By Benjamin F. McDowell,
M.B. & M.D. of T.C.D., F.R.C.S.I.,

Surgeon to Mercer's and the Westmoreland Lock Hospitals, Member of Council of Surgical Society of Ireland, &c.

The several operations for opening the windpipe are so well known to practical surgeons that it is unnecessary to describe them before this society. My objects are twofold: In the first place, to repeat the conviction—forced upon me by some experience—that laryngo- or suprathyroid tracheotomy is the proceeding best suited for the great majority of cases we meet with when any operation of the kind is called for, as well as being the simplest and safest. Secondly, to say a few words upon some forms of destructive syphilitic ulceration of the larynx, which, on reaching a certain stage, if not properly treated, involve the question, either for immediate relief by operation to save life, or the alternative of sudden death from laryngeal spasm.

First, as regards the special form of operation advocated. In two papers which I read before this Society in the sessions 1869, '70, and '73-74, the peculiar advantages of the high operation were illustrated and strongly enforced. I shall give a brief *résumé* of those papers. The first was chiefly devoted to giving the details of a patient, aged 26, who was suffering from a severe attack of acute laryngitis, in which this operation was performed. She suffered, as she said, from the effect of "a severe cold in her throat and chest," which was brought on by leaving a heated room and getting wet. I saw her immediately after her admission. There was no syphilitic history. Her countenance was indicative of anxiety; her breathing laboured, and accompanied by a peculiar hissing sound. She gave an occasional cough, which was brassy in character, and her voice was altered to a whispering tone. Upon examination with the laryngoscope there was no sign of effusion about the base of the epiglottis or arytenoid cartilages, nor was there any appreciable narrowing of the rima; the only apparent departure from the normal state of the parts being the want of the natural secretion of the mucous membrane. There was pain in deglutition, and tenderness in the throat outside, and she complained of pain when the tongue was drawn out in the employment of the laryngoscope. She was ordered to bed. Six leeches were directed to be applied at once to the throat over the larynx, to be followed by hot fomentations. Inhalations of the vapours of hot water were also ordered, and a powder consisting of one grain and a-half of calomel and three of James's powder every third hour. I saw her again that night and thought her condition improved by this treatment. The powders, fomentations, and inhalations were directed to be continued.

Upon my visit the following morning it was found that she was notably worse. She had had, the nurse reported, but little sleep, and that was interrupted by sudden starts of fear (as if from spasm of the glottis) lest she might be suffocated. Her pulse was full and rapid, amounting to 120. The breathing was so laboured that it required a considerable muscular effort to fill the chest, and respiration was accompanied by a peculiar rasping sound. The voice was reduced to a mere whisper. There was much pain in swallowing, and deglutition was immediately followed by increased dyspnœa, but there was as yet no lividity of face, or coldness of extremities. At three o'clock there was no increased urgency in the symptoms; on the contrary, the pulse was softer and the breathing less laboured. At 11 o'clock, p.m., her condition seemed in every way greatly improved. Her countenance was not indicative of so much distress, the dyspnœa less urgent, and the voice somewhat more audible. It was evident that the mercurial treatment, combined with antimony, had done good service, and there was reason to hope that the disease had reached its culminating point, the highest pitch of inflammation had been obtained, and that a subsidence of the urgent symptoms which imperilled her life might now fairly be expected.

At 8.30 the following morning, which was about 36 hours from the period of her admission, I was summoned to see her forthwith, as she had become much worse. When I reached the hospital, which was but a few minutes afterwards, I found her in a dying state, her eyes were prominent and wild-looking. She was supported by pillows to assist her breathing, which was intensely laboured. The face, arms, and trunk were livid with venous congestion, and the extremities cold. She was all but pulseless. Every moment was now of consequence. I had a table placed at once before the light; but no sooner was she placed upon it than we perceived she had ceased to breathe. I immediately transfixed the skin and cut into the crico-thyroid membrane, and having dilated this opening I was disappointed to find that no air was admitted to the chest. The cricoid cartilage and uppermost ring of the trachea were now divided, but with no better success. One of two courses, therefore, only remained to be adopted—either to divide the trachea down to the thyroid isthmus, or perform the deep operation. As time was so precious—every second important—I determined upon the former proceeding. Accordingly, having extended the integumental incision a little downwards, divided the fascia, and procured the separation, well apart, of the margins of the sterno-hyoid and thyroid muscles, and pressed down with the forefinger of my left hand the thyroid isthmus with the blade of the scalpel pointing upwards, I now divided two or three more rings of the trachea on the line of the previous incision. The instant this was accomplished I was delighted to find that there was a sudden rush of air into the lungs which completely inflated the chest. This was followed by gasping respiration through the double tracheotomy-tube, which was meanwhile introduced, and secured by tapes round the neck. Nervous stimulation was now employed in almost every possible way. Wet cloths were slapped over the chest and face, mustard applied over the region of the heart and abdomen, hot jars to the feet, and a powerful enema of brandy, hot water, and turpentine was thrown into the rectum. It would be difficult to describe the picture which now presented itself, in the gradual return to vitality and consciousness of an individual whose life, a few minutes previously, might be supposed extinct.

I left the patient in about half an hour breathing pretty regularly through the tube, but respiration was shallow and hurried, and accompanied by an occasional gasp.

At 11 o'clock she had nearly regained her natural colour, and looked wonderfully tranquil. Respiration was deeper and not so hurried, but her pulse was intermitting. The nurse states she has expectorated a good deal of blood, mixed with mucus, through the tube.

2 o'clock.—Looks very tranquil, and has been refreshed by nearly an hour's sleep. Pulse 120, still intermitting.

9 o'clock, p.m.—Going on well; points to her mouth as being sore, which is evidently due to the active mercurial treatment employed prior to operation. Mercurial fœtor from the breath. As there was great pain in swallowing she was ordered a beef-tea and egg enema, with half a glass of wine every four hours, and an astringent gargle for the mouth.

It is needless to follow the details of this case further. It will be sufficient to observe that, on the night of the twelfth day, she consented to pass that night without the tube; that on the twenty-sixth day the artificial openings were completely healed; and that she left the hospital in a few days afterwards quite well.

In this case it will be observed that laryngotomy was first employed, and, failing in this, laryngo-tracheotomy. This was done from necessity, as the patient was quite asphyxiated when I commenced to operate, and the delay

(a) Read before the Surgical Society of Ireland. The debate will be found on page 247.

in performing the deep operation would certainly have frustrated the effort to save life. In this instance the submucous effusion or œdema was both supra- and infra-glottic in its position. The supra-glottic œdema was amply proved by examination with the laryngoscope on Sunday evening, that immediately preceding the morning of the operation, when the epiglottis was erect, swollen, and red, and there was considerable effusion at the base of the arytenoid cartilages, and in the neighbourhood of the superior cords; but on coming to operate the next morning I found the entire cavity of the larynx, and down at least to the lower margin of the second ring of the trachea, completely occluded. The supra-glottic œdema, so far at least as this case teaches us, as manifested by the laryngoscope, is no proof that infra-glottic œdema may not co-exist as has been urged by some writers. But, so far as it goes, it seems to teach us the practical fact that infra-glottic œdema may exist and extend down to the third ring of the trachea, and yet that the supra-thyroid operation may be employed with success.

The second case in which it was found necessary to perform this special operation, and in which its advantages were well exemplified, was that of a man, æt. 48, who was admitted to Mercer's Hospital on the 15th of October, 1875. In regard to it, it will be sufficient for my present purpose to state that, on the 16th day after the operation, the tracheal tube was finally removed, and that in three weeks afterwards, the openings in the trachea and skin were completely healed, the larynx had resumed its normal vocal and respiratory functions, and the man was discharged a few days subsequently, quite well.

The third case in which I performed laryngo-tracheotomy happened also to be one of extreme urgency; and whilst it forcibly illustrates the advantages of this operation, it at the same time demonstrates the necessity for such a proceeding in certain cases of syphilitic disease of the larynx, the peculiar nature of which will be referred to further on. I have to thank Dr. T. D. Rice, the resident surgeon of the Westmoreland Lock Hospital, for the ample notes of the case with which he kindly furnished me; and I take this opportunity to acknowledge the great attention which he bestowed upon it. The patient came under treatment on the 14th of February, 1876, and was discharged quite well, in twenty-eight days afterwards. The tube was removed on the ninth day; the tracheal opening and external wound were quite healed in eleven days subsequently, and the extensive laryngeal ulcer which provoked the intense difficulty of breathing, accompanied by laryngeal spasm—threatening the patient's life—was cicatrised. The woman left the hospital a few days afterwards, and has since had a perfectly healthy child.

In all those cases prompt relief was called for, and the delay which would have been involved in performing the deep operation would, in two of them at least, have proved unquestionably fatal.

Mr. Stokes, Professor of Surgery in this College, has amongst his other valuable papers, contributed one. Mr. Bennett has also written in favour of the operation. Under all circumstances I again urge the special advantages of the operation above the thyroid body to favourable notice, as being the best suited to the great majority of cases in practice, and as being, at the same time, easy of execution, and unattended with danger.

Now, as regards the second portion of this paper, namely, the advisability of tracheotomy in syphilitic disease of the larynx. This sometimes becomes a question of life or death; and I am aware of no class of case which is calculated to cause more anxiety to the surgeon, or, in certain instances, requires more vigilant treatment.

I can point to two instances of death as the result of laryngeal spasm, caused by destructive syphilitic ulceration extending down to the larynx. The first occurred some fourteen years ago. The patient was under the care of my colleague, the late Dr. Byrne, and suffered from tertiary syphilitic disease. She was prescribed for on one day; on the next we found her dead. Upon inquiring into the circumstances of her death, the patients around her stated that she had been seized with spasm, was unable to draw her breath, and, flinging her arms wildly about, became livid in the face, gasped for breath, and expired before surgical relief could be obtained.

The second case of death from laryngeal spasm, as the result of this disease, occurred under the care of my late lamented colleage, Dr. Morgan. The patient suffered from extensive tertiary ulcerations—throat included. There was great difficulty of breathing, and occasional laryngeal spasm; which latter was, however, relieved by the inhalation of chloroform. The question of the advisability of tracheotomy was anxiously discussed, but its further consideration postponed till next day. On the day subsequent when we met, our patient was dead, death having been caused by one of those aggravated paroxysms.

In the face of such experiences, there can be little doubt that there are cases occasionally to be met with in this disease in which tracheotomy becomes a positive necessity. Speaking upon this subject, Mr. Bryant—no mean authority on this as well as other questions in practical surgery—says: "When ulceration has commenced, and seems to be unaffected by general treatment, the subject of tracheotomy claims serious consideration; for, unless the organ of voice and respiration can be kept quiet, repair will not go on; and as long as progressive ulcerative disease exists, a sudden spasm of the larynx is imminent, and also the death of the patient. The operation should, however, only be undertaken when the disease is steadily progressing in spite of treatment, and it is clear that the larynx will be destroyed as a vocal as well as a respiratory organ, unless some steps be taken to stop its progress; and of these steps there are none equal to tracheotomy; for all surgeons are familiar with the fact that, even under the most extreme conditions of disease, repair goes on in the larynx directly the tube has been introduced, and physiological rest is given to the organ (*Vide* paper by author, "Clin. Soc. Trans.," 1868.)

Mr. Hilton, in his admirable "Course of Lectures on the Influence of Mechanical and Physiological Rest in the Treatment of Accidents and Surgical Diseases, &c.," speaking of tracheotomy, and its advisability in this disease, as well as in other lesions, thus expresses himself:—"In chronic laryngitis, cured by tracheotomy, the cure is not effected by opening the larynx, but by giving the larynx rest. The operation is performed in reference to these two circumstances; in reference first, no doubt, to securing the continuance of life by allowing the patient to breathe through the tracheal tube; secondly and ulteriorly, the object is to give rest to the diseased part. In the performance of tracheotomy for disease of the larynx, the surgeon never touches the disease at all; he merely enables the patient to breathe through the tracheal tube, and diverts the stream of air away from the larynx, thus giving the larynx the opportunity of recovering itself."

I now proceed to give brief records of a few cases.

On the 4th November, 1868, A.B., æt. 39, consulted me. He had contracted syphilis twelve years previously, and was apparently cured. Six months before my seeing him, he was attacked by erysipelas, and was confined to bed for three weeks. He got so far well as to be able to attend to his business as usual; but his old enemy declared its intentions by a well-pronounced crop of gummata over his lower extremities. He was a married man, and had a healthy family.

It is extraordinary how this treacherous disease will lurk in the blood, and take its opportunity upon the occurrence of any depressing influence to the system to declare its vitality, even after many years of quiescence. The gummata, some of which had reached the stage of ulceration, were sufficient to cause him anxiety, but it was his throat which chiefly troubled him. It was for this he sought my advice. Upon examination it was found that he had completely lost his soft palate; that he had ulceration of the gums, and that there was an extensive phagedænic ulcer, extending down to the base of the epiglottis. He had that peculiar husky voice, so characteristic of syphilitic disease of

the larynx, and he suffered from great debility. At night he was occasionally alarmed, when just in the act of falling asleep, by sudden spasm of the larynx, accompanied by such intense dyspnœa—in the day-time, also, now and then—that suffocation was more than once imminent. The ulcer upon the throat was carefully touched with the liquor of pernitrate of mercury; those on the legs were also treated in the same manner. He was ordered ten grains each of bromide and iodide of potassium, three times a day—a combination which, in such cases, has found much favour with me. It is not always, however, that this can be borne. A liberal diet and change were also insisted upon. Under this treatment, together with the use of a gargle consisting of chlorinated sodium, and a wash of the same for the ulcers upon his legs, he made a rapid recovery, and has not found it necessary since to consult any surgeon.

The third case I shall mention is that of a married woman, upon whom I performed laryngo-tracheotomy in order to save life. She was suffering from chronic syphilitic ulceration of the larynx. The syphilitic history was of many years' standing, and she had been several times under treatment previously. She had had numerous miscarriages. Upon the occasion of her last admission to Mercer's Hospital, her symptoms were most distressing. She suffered from continual dyspnœa, accompanied by almost complete loss of voice, and occasional attacks of laryngeal spasm, which at times imperilled her life; nevertheless, under active local and general treatment, the ulceration healed, and the disease was placed in abeyance; only, however, as well as will be seen, to declare itself again, and in a worse form than previously. A few months afterwards, she was accordingly admitted to hospital, upon which occasion her condition was so bad that an immediate consultation was deemed necessary; at which tracheotomy was determined on as the only means of saving her life. Five o'clock p.m. was fixed upon for the operation. When I arrived, two or three minutes after that hour, I well recollect that my colleague, the late Dr. Morgan, together with Mr. Rice, was with her. Dr. Morgan, who had his sleeves tucked up and the knife in his hand, said, "Make haste, or she will be dead!' I at once performed the high operation. It is not necessary to weary this Society with the full details of the case; suffice it to say that she left the hospital, as has been before mentioned, on the twenty-eighth day, quite well; the wounds and skin of the trachea healed, and of course, the terrible necessity of having to wear the tube obviated.

Dr. James Stannus Hughes, one of the Professors of Surgery in this College, and whose experiences upon this and other surgical subjects are well known, kindly lent me the ingenious instrument, which I believe the late Mr. Carmichael invented, and which I now exhibit. I did not, however, employ it as intended, by reason of the sudden necessity for operation; and having had no experience of that instrument, I preferred the method of procedure which I had found so successful on former occasions.

J. W., æt. 43, a gentleman who had resided in India for ten years, but who was nevertheless a strong, healthy-looking man, came home on leave, contracted a soft sore in London, which rapidly healed, but it was accompanied or rather followed, by a suppurating bubo in the left groin; this was opened, and apparently well, leaving behind, however, a large smooth cicatrix. He went to his people in the country, but returned in the course of three or four months, to obtain advice in reference to an ugly crescentic serpigenous ulcer, which declared itself upon the cicatrix of the bubo. This ulcer proved, as is nearly always the case, most intractible; extending and healing, and healing and extending, leaving its snail-track-like cicatrix behind it as it healed; under mercurial treatment, and the use of powerful local applications, followed by actual cautery, it got well. He left town, but came back in a few weeks complaining of his throat. Upon examination, an ulcer with everted, thickened, and jagged edge, was observed upon the left tonsil, extending far down. He complained of difficulty in swallowing. His voice and breathing soon became affected, and he had occasional attacks of laryngeal spasm. A fresh mercurial course was administered, and the ulcer was freely touched with terchloride of antimony. He made an excellent recovery.

The two forms of syphilitic ulceration of the larynx in which tracheotomy may be called for, it will thus be seen, are either of the phagedænic or serpigenous type. A distinction must be drawn between them. The former is much the most common, and will be found to pronounce itself generally in naturally weak and broken-down subjects. It is rapid and destructive in its progress, often eroding the cartilages of the larynx; it requires active local, as well as general treatment. The margin of this form of ulceration is sharply cut, and there is no surrounding thickening of the tissues. The serpigenous form, on the other hand, most commonly occurs when it does present itself (which is very rarely), in strong, healthy individuals; it is much slower in its progress, and carries before it an effusion of specific lymph; its edges thickened, irregular, and of lupoid character. It is in the phagedænic that large doses of the iodides of potassium and iron, combined with opium, and a liberal diet, will prove most serviceable. In the serpigenous form of ulceration, the best results are to be obtained, I believe, from the judicious administration of a carefully sustained course of mercury.

From want of time, I have refrained from entering upon questions of great importance in regard to this operation; such, for example, as to the nature of the tube, condition of the atmosphere, &c.

In regard to the pathology of this laryngeal spasm, which is most interesting, I have not, Sir, entered upon it; and I have only to say that in the phagedænic variety of ulceration, it seems natural to suppose that it is caused by exposure of the recurrent laryngeal nerve; whereas in the serpigenous it is probably the result of pressure upon that nerve, or of pressure and ulceration combined, as sometimes happens in cases of malignant disease.

Clinical Records.

CASE OF STRANGULATED HERNIA, IN WHICH THE ASPIRATOR WAS USED.

Reported by GEO. I. MACKESY, M.B.,
Junior-Surgeon, Leper Hospital, Waterford.

THE following case, showing the great benefit derived from the use of the aspirator in cases of strangulated hernia, may, perhaps, not be without interest:—

Martin M'Evoy was admitted into the Waterford Leper Hospital (City Infirmary) on the morning of Jan. 30th, 1877, suffering from a large scrotal hernia, which had been strangulated from the evening previous. Before coming to hospital he had suffered from vomiting. On admission reduction was attempted under chloroform, but without success. Tinct. opii was given internally.

3 p.m.—At a consultation it was determined to use the aspirator. Accordingly, a fine needle was introduced into the tumour, and twelve ounces of fluid drawn off, some of it of a dark and feculent appearance; a quantity of flatus also escaped. The tumour became soft and greatly reduced in size. The taxis was again tried; but though the gut gurgled, the attempt at reduction was again unsuccessful. The condition of parts was, however, much improved, and as the constitutional symptoms were not urgent, it was determined to temporise still further. A consultation was arranged for the night. Administration of opium continued internally, and an enema of soap and water given.

9 p.m.—Enema was retained. Before proceeding to operate the taxis was again tried, and this time with success, the gut returning into abdominal cavity.

31st.—Peritoneal tenderness. Warm stupes over sto-

mach; calomel and opium internally; enema of castor oil, sulph. magnesiæ, and water.

8 p.m.—Bowels acted freely; abdominal tenderness not so great.

Feb. 1st.—Much better. Calomel no longer given; but as he was suffering from cough, opium was given in an expectorant mixture.

8.30 p.m.—Bowels freely opened. Doing well.

7th.—Left hospital, with a truss, quite well.

He has since been following his business.

But for the aspirator, the gut would not, I believe, have been returned without operation.

Transactions of Societies.

CLINICAL SOCIETY OF LONDON.

FRIDAY, MARCH 9TH, 1877.

GEORGE W. CALLENDER, F.R.S., President, in the Chair.

RULES RESPECTING PAPERS TO BE READ BEFORE THE SOCIETY.—The President directed the attention of members desirous of contributing papers for reading and discussion to the rule which requires such papers to be forwarded to the Secretary one week at least before the meeting at which they are to be brought forward.

EXOPHTHALMIC GOITRE, WITH NEW PHENOMENA.

Dr. BURNEY YEO read the paper on this subject and brought forward two cases of the disease which presented some new phenomena. One patient, a married woman, had suffered from palpitation for more than eight months. There were also pain in left side, cough, dyspnœa, loss of flesh, and appetite, vomiting, diarrhœa, and profuse perspiration. After an attack of fever following her confinement eighteen months ago, her friends noticed that she had a very wild look. When Dr. Yeo first saw her the symptoms were marked exophthalmus of the left eye with great enlargement of the right lobe of the thyroid, and pulse 136. In June, or a month after he first saw her the hairs of the eyebrow, all the eyelashes of the lower lid, and part of those of the upper lid completely disappeared. Change of air and iodide of potassium produced some improvement, but in November all the symptoms became aggravated and the diarrhœa troublesome, and a systolic murmur was heard over the base of the heart and along the carotids. In December the right eye became somewhat prominent simultaneously with enlargement of the left lobe of the thyroid, while, at the same time, the hair of the right eyebrow and eyelashes began to disappear. Latterly, the patient has been getting much worse, and was suffering much from diarrhœa, perspiration, great debility, cough, sanguineous expectoration. Dr. Yeo then told the Society that (1) he doubted whether the cardiac excitement usually preceded, or had any causal relation to the exophthalmus or goître. He believed the exophthalmus and the palpitation were the effect of a common cause. 2. The unilateral nature of the exophthalmus and thyroid enlargement, the loss of hair, and the crossed character of the phenomena were very remarkable. 3. There is a tendency to disregard the more widely diffused manifestation of the disease, such as diarrhœa, perspiration, paresis of the cutaneous vessel, and the mobility and irritability of the nervous system, and from these and other considerations he was in favour of a central nervous lesion as the pathological basis of the phenomena.

Dr. GREENHOW said, he had seen a similar falling off of hair in one of his cases. He had also in some cases observed the partial or unilateral character of the disease, and that the right lobe of the thyroid was often enlarged before the left. The exophthalmus might also be greater on one side, but in all the cases the preponderance of symptoms was on the same side, usually the right. In his case he had found five-grain doses of iodide of potassium with syrup of iodide of iron more beneficial than anything else, while great benefit was also derived from a visit to Margate and afterwards to Schwalbach. The origin of the disease seemed in most cases to be due to mental shock, such, for instance, as the sudden loss of three children from scarlet fever, and in another instance he knew of, to hyperlactation.

Dr. THEODORE WILLIAMS had had three cases under his care one of which resembled one of those described by Dr. Yeo, but his treatment consisted chiefly of the tincture of the perchloride of iron and change of air, the latter being, in his opinion, the most beneficial.

Mr. CASSON having seen a good deal of common goître had been led to doubt whether exophthalmic goître was anything more than a variety of that disease. In some cases he had seen marked nervous symptoms associated with ordinary bronchocele. He believed that an anæmic and hysterical condition was often found in common goître, and that iron and iodide of potassium were of great use in its treatment.

Dr. YEO, in reply, said, he attributed the disease in his case to the confinement and the attack of fever. He thought the crossed character of the disease might indicate a central origin. He was glad to hear that the use of iron and iodine was approved of by other members of the Society, as both had been denounced by some writers on the disease. The diarrhœa, however, which was such a troublesome complication, was often aggravated by drugs that were otherwise beneficial. He was surprised that any one should think that ordinary bronchocele and exophthalmic goître were identical.

In reference to the loss of hair, Mr. Callender mentioned the case of a gentleman who came to him in great distress for the loss of one-half of his moustache, and who subsequently lost the other half, together with the beard and whiskers.

MEDICAL MICROSCOPICAL SOCIETY OF LONDON.

AT the last meeting of the Society, HENRY POWER, F.R.C.S., President, in the chair, Dr. BROWNING exhibited two interesting specimens illustrative of

HYPERÆMIA OF THE BRAIN FROM HANGING.
